TABLE OF CONTENTS

PROPOSED FINDINGS OF FACT

I. INTRODUCTION

A. Illumina

1. Overview

1. Illumina is the global leader in sequencing- and array-based solutions for genetic and genomic analysis. (PX0061 (Illumina) at 5; PX0091 (Illumina) at 4.) Illumina's focus is on next-generation sequencing ("NGS") technology. NGS technology is a much higher throughput type of sequencing that allows for the simultaneous sequencing of millions or even billions of sequences in a single run. (Aravanis (Illumina) Tr. 1841.)

Response to Finding No. 1

Complaint Counsel does not disagree that Illumina is the dominant provider of NGS instruments and consumables, and indeed the only option feasible for MCED test developers. (*See* CCFF ¶¶ 1019-1211). In fact, Illumina is the only provider of NGS systems in the United States that is capable of "simultaneous sequencing of … billions of sequences in a single run" (PX0085 (Illumina) at 001, 003 (NovaSeq 6000 System Specifications (stating that the NovaSeq can generate 20 billion single-end reads per run using two S4 flow cells)), which is a key technical requirement for MCED testing (*see* CCFF ¶¶ 931-54).

Complaint Counsel also does not agree that NGS offers "much higher throughput" than other types of sequencing.

2. Illumina was incorporated in California in April 1998 and reincorporated in Delaware in July 2000. (PX0061 (Illumina) at 5.) Its principal executive offices are located in San Diego, California. (PX0061 (Illumina) at 5.)

Response to Finding No. 2

Complaint Counsel does not disagree with the proposed finding.

3. Illumina's products and services serve customers in a wide range of markets, enabling the adoption of genomic solutions in research and clinical settings. (PX0061 (Illumina) at 5; *see also* Berry (Illumina) Tr. 807–08.) Illumina's customers include leading genomic research centers, academic institutions, government laboratories, and hospitals, as well as pharmaceutineecal, biotechnology, commercial molecular diagnostic laboratories, and consumer

genomics companies. (PX0061 (Illumina) at 5; *see also* deSouza (Illumina) Tr. 2313–15; Berry (Illumina) Tr. 807–09; [redacted]

Response to Finding No. 3

Complaint Counsel has no specific response.

4. Illumina's portfolio of integrated sequencing and microarray systems, consumables, and analysis tools is designed to accelerate and simplify genetic analysis. (PX0061 (Illumina) at 5.) This portfolio addresses the range of genomic complexity, price points, and throughput, enabling customers to select the best solution for their research or clinical application. (PX0061 (Illumina) at 5; PX0091 (Illumina) at 14.)

Response to Finding No. 4

Complaint Counsel has no specific response.

2. **Illumina's Businesses**

5. Illumina targets life sciences and clinical genomics segments and customers. (PX0061 (Illumina) at 6; deSouza (Illumina) Tr. 2318.)

Response to Finding No. 5

Complaint Counsel has no specific response.

6. Life Sciences. Historically, Illumina's core business has been in life sciences research. (PX0061 (Illumina) at 6.)

Response to Finding No. 6

Complaint Counsel has no specific response.

6.1 This includes laboratories associated with universities, research centers, and government institutions, along with biotechnology and pharmaceutical companies. (PX0061 (Illumina) at 6; *see also* deSouza (Illumina) Tr. 2312–13; [redacted]

Response to Finding No. 6.1

Complaint Counsel has no specific response.

6.2 Researchers at these institutions use Illumina's products and services for basic and translational research across a spectrum of scientific applications, including targeted, exome, and whole-genome sequencing, genetic variation; gene expression, epigenetics, and metagenomics. (PX0061 (Illumina) at 6; *see also* deSouza (Illumina) Tr. 2313–15; [redacted]

Response to Finding No. 6.2

Complaint Counsel has no specific response.

6.3 Next-generation sequencing (NGS) technologies are being adopted due to their ability to sequence large sample sizes quickly, accurately, and cost-effectively, generating vast amounts of high-quality data. (PX0061 (Illumina) at 6.)

Response to Finding No. 6.3

Complaint Counsel has no specific response.

7. Illumina's products also serve various applied markets including consumer genomics and agrigenomics. (PX0061 (Illumina) at 6; *see also* deSouza (Illumina) Tr. 2318.)

Response to Finding No. 7

Complaint Counsel has no specific response.

7.1 For example, in consumer genomics, Illumina's customers use Illumina's technologies to provide personalized genetic data and analysis to individual consumers. (PX0061 (Illumina) at 6; PX0091 (Illumina) at 24.)

Response to Finding No. 7.1

Complaint Counsel has no specific response.

7.2 In agrigenomics, government and corporate researchers use Illumina's products and services to explore the genetic and biological basis for productivity and nutritional constitution in crops and livestock. (PX0061 (Illumina) at 6; *see also* Berry (Illumina) Tr. 807.) Researchers can identify natural and novel genomic variation and deploy genome-wide, marker-based applications to accelerate breeding and production of healthier and higher-yielding crops and livestock. (PX0061 (Illumina) at 6.)

Response to Finding No. 7.2

Complaint Counsel has no specific response.

8. Clinical Genomics. Illumina is focused on enabling translational and clinical markets through the introduction of best-in-class sequencing technology. (PX0061 (Illumina) at 6; *see also* [redacted]; PX0091 (Illumina) at 18.) Further, Illumina is developing sample-to-answer solutions to catalyze adoption in the clinical setting, including in reproductive and genetic health and oncology. (PX0061 (Illumina) at 6; *see also* PX7072 (deSouza (Illumina) IHT at 157–58).)

Response to Finding No. 8

[redacted]

9. *Reproductive Health.* In reproductive health, Illumina's primary focus is driving the adoption of noninvasive prenatal testing (NIPT) globally through Illumina's technology, which identifies fetal chromosomal abnormalities by analyzing cell-free DNA in maternal blood. (PX0061 (Illumina) at 6; RX2264 (Illumina) at 50); PX0091 (Illumina) at 20–21.)

Response to Finding No. 9

Complaint Counsel has no specific response to this proposed finding.

10. *Rare and Undiagnosed Disease.* Illumina's NGS technology is also accelerating rare and undiagnosed disease research to discover the genetic causes of inherited disorders by assessing many genes simultaneously. (PX0061 (Illumina) at 6; *see also* deSouza (Illumina) Tr. 2326–27, PX0091 (Illumina) at 22.) Using NGS can reduce costs compared to traditional methods of disease diagnosis, which are often expensive and inconclusive while requiring extensive testing. (PX0061 (Illumina) at 6.)

Response to Finding No. 10

Complaint Counsel has no specific response to this proposed finding.

11. *Oncology.* Cancer is a disease of the genome, and the goal of cancer genomics is to identify genomic changes that transform a normal cell into a cancerous one. (PX0061 (Illumina) at 6.) Understanding these genomic changes will improve diagnostic accuracy, increase understanding of the prognosis, and enable oncologists to target therapies to individuals. (PX0061 (Illumina) at 6; *see also* Aravanis (Illumina) Tr. 1828.)

Response to Finding No. 11

Complaint Counsel has no specific response to this proposed finding.

11.1 There are a variety of NGS applications in oncology including: research applications where people sequence cancer cells to understand cancer biology, how cancer is behaving and how to treat it; therapy selection applications where a tumor is sequenced to understand whether or not any of the mutations that are present might be targetable by a drug, monitoring or minimal residual disease where the goal is to look for cancer signals in the blood in order to determine how effective a treatment is and early cancer detection where cancer is detected in asymptomatic patients. (Aravanis (Illumina) Tr. 1843.)

Response to Finding No. 11.1

Complaint Counsel has no specific response to this proposed finding.

11.2 Customers in the translational and clinical oncology markets use Illumina's products to perform research that may help identify individuals who are genetically predisposed to cancer and to identify molecular changes in a tumor. (PX0061 (Illumina) at 6; *see also* Berry (Illumina) Tr. 814–22; PX0091 (Illumina) at 17; [redacted] Illumina believes that circulating tumor DNA (ctDNA) will become an important clinical tool for managing oncology patients during all stages of tumor progression. (PX0061 (Illumina) at 6–7; [redacted]

Response to Finding No. 11.2

[redacted]

11.3 Illumina's technology is being used to research the implications of ctDNA in treatment determination, treatment monitoring, minimal residual disease, and asymptomatic screening. (PX0061 (Illumina) at 7; *see also* Aravanis (Illumina) Tr. 1843; PX0091 (Illumina) at 19.)

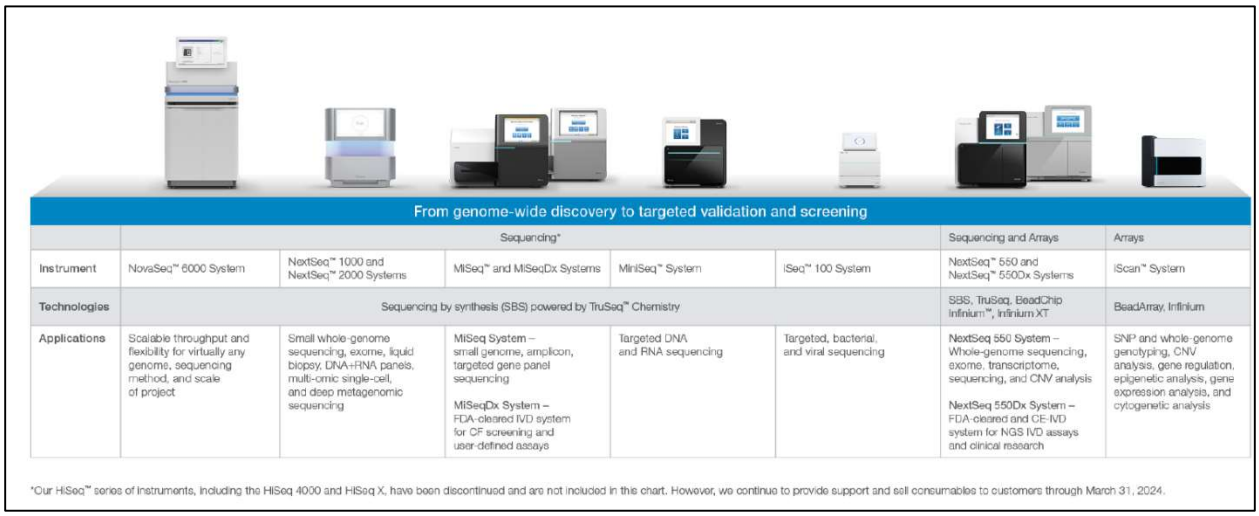
Response to Finding No. 11.3

Complaint Counsel has no specific response to this proposed finding.

3. **Principal Products, Services and Technologies**

12. Illumina's unique technology platforms support the scale of experimentation necessary for population-scale studies, genome-wide discovery, target selection, and validation studies. (PX0061 (Illumina) at 7; Berry (Illumina) Tr. 823–26.)

Figure 1: Illumina Platform Overview



From genome-wide discovery to targeted validation and screening

	Sequencing*					Sequencing and Arrays	Arrays
Instrument	NovaSeq™ 6000 System	NextSeq™ 1000 and NextSeq™ 2000 Systems	MiSeq™ and MiSeqDx Systems	MiniSeq™ System	iSeq™ 100 System	NextSeq™ 550 and NextSeq™ 550Dx Systems	iScan™ System
Technologies	Sequencing by synthesis (SBS) powered by TruSeq™ Chemistry					SBS, TruSeq, BeadChip Infinium™, Infinium XT	BeadArray, Infinium
Applications	Scalable throughput and flexibility for virtually any genome, sequencing method, and scale of project	Small whole-genome sequencing, exome, liquid biopsy, DNA+RNA panels, multi-omic single-cell, and deep metagenomic sequencing	MiSeq System – small genome, amplicon, targeted gene panel sequencing MiSeqDx System – FDA-cleared IVD system for CF screening and user-defined assays	Targeted DNA and RNA sequencing	Targeted, bacterial, and viral sequencing	NextSeq 550 System – Whole-genome sequencing, exome, transcriptome, sequencing, and CNV analysis NextSeq 550Dx System – FDA-cleared and CE-IVD system for NGS IVD assays and clinical research	SNP and whole-genome genotyping, CNV analysis, gene regulation, epigenetic analysis, gene expression analysis, and cytogenetic analysis

*Our HiSeq™ series of instruments, including the HiSeq 4000 and HiSeq X, have been discontinued and are not included in this chart. However, we continue to provide support and sell consumables to customers through March 31, 2024.

Response to Finding No. 12

The proposed finding is vague and confusing. The proposed finding is vague because the term "support" is ambiguous and undefined. The proposed finding is also vague because the phrases "scale of experimentation," "population-scale studies," "genome-wide discovery," "target selection," and "validation studies" are ambiguous and undefined. The proposed finding is also vague because it references Illumina's "technology platforms" generically and does not specify which specific platform or platforms "support" particular listed attributes. The proposed finding is confusing because the relevance of the ambiguous attributes to MCED development is not specified.

Respondents' inclusion of Figure 1 in the proposed finding is itself confusing. Complaint Counsel is unsure for what purpose Figure 1 is offered. Given that Respondents do not specifically reference the figure or state whether it is offered for the truth, for the fact that particular statements were made, or for some other purpose, the material is not properly offered

as a finding of fact and should be disregarded. To the extent Respondents purport to simply include everything within Figure 1 as a "fact," the proposed finding is improper because it would represent a compound finding rather than a single finding of fact. To the extent anything in the proposed finding is intended to suggest that Illumina NGS sequencing is not a necessary input to MCED tests, the proposed finding is also misleading and against the weight of the evidence. (*See* CCFF ¶¶ 886- 1900).

13. Customers use Illumina's products to analyze the genome at all levels of complexity, from targeted panels to whole-genome sequencing. (PX0061 (Illumina) at 7.) A large and dynamic Illumina user community has published tens of thousands of customer-authored scientific papers using Illumina's technologies. (PX0061 (Illumina) at 7.) Through rapid innovation, Illumina is changing the economics of genetic research, enabling projects that were previously considered impossible, and supporting clinical advances towards precision medicine. (PX0061 (Illumina) at 7.)

Response to Finding No. 13

The proposed finding is vague because Respondents do not explain how Illumina is "changing the economics of genetic research" or identify which projects Illumina is enabling "that were previously considered impossible." Moreover, Respondents proposed finding is misleading to the extent that it implies Illumina is not profiting off of the sale its sequencers to the "larger and dynamic Illumina user community." Therefore, this Court should disregard the proposed finding.

14. Most of Illumina's product sales consist of instruments and consumables, which include reagents, flow cells, and microarrays, based on Illumina's proprietary technologies. (PX0061 (Illumina) at 7; *see also* Aravanis (Illumina) Tr. 1844–47; Berry (Illumina) Tr. 826–28.)

Response to Finding No. 14

Complaint Counsel has no specific response to this proposed finding.

15. Illumina also performs various services for its customers. (PX0061 (Illumina) at 7; *see also* [redacted], 865–66; PX7076 (Berry (Illumina) Dep. at 87–92); PX7063 (Berry (Illumina) IHT at 35–36.) In 2020, 2019, and 2018, instrument sales represented 13%, 15%, and 17%, respectively, of total revenue; consumable sales represented 71%, 68%,

and 65%, respectively, of total revenue; and services represented 16%, 17%, and 18%, respectively, of total revenue. (PX0061 (Illumina) at 7.)

Response to Finding No. 15

[redacted]

16. Sequencing. DNA sequencing is the process of determining the order of nucleotide bases (A, C, G, or T) in a DNA sample. (PX0061 (Illumina) at 7; *see also* Aravanis (Illumina) Tr. 1828.)

Response to Finding No. 16

Complaint Counsel does not disagree with the proposed finding.

16.1 Illumina's portfolio of sequencing platforms represents a family of systems that Illumina believes set the standard for productivity, cost-effectiveness, and accuracy among NGS technologies. (PX0061 (Illumina) at 7; deSouza (Illumina) Tr. 2327–2328; Berry (Illumina) Tr. 809–811.)

Response to Finding No. 16.1

The proposed finding is vague because it does not define what the "standard for productivity, cost-effectiveness, and accuracy among NGS technologies" is. Therefore, this Court should disregard the proposed finding.

17. Customers use Illumina's platforms to perform whole-genome, de novo, exome and RNA sequencing, as well as targeted resequencing of specific gene regions and genes. (PX0061 (Illumina) at 7.)

Response to Finding No. 17

The proposed finding is misleading because customers using Illumina NGS instruments for MCED testing—which is at issue in this proceeding—do not use Illumina's platform for whole-genome sequencing, de novo sequencing, or exome sequencing, nor do they use Illumina platforms for targeted resequencing (as that term is typically employed, referring to sequencing genomic or chromosomal DNA from sources such as white blood cells). MCED developers use

Illumina's NGS platform to simultaneously examine thousands of cancer biomarkers in cfDNA extracted from blood plasma samples. (*See* CCFF ¶¶ 340-48). Therefore, this Court should disregard the proposed finding.

17.1 Whole-genome sequencing determines the complete DNA sequence of an organism. (PX0061 (Illumina) at 7; RX2264 (Illumina) at 76.)

Response to Finding No. 17.1

The proposed finding is misleading because customers using Illumina NGS instruments for MCED testing—which is at issue in this proceeding—do not use Illumina's platform for whole-genome sequencing. MCED developers use Illumina's NGS platform to simultaneously examine thousands of cancer biomarkers in cfDNA extracted from blood plasma samples. (*See* CCFF ¶¶ 340-48). Therefore, this Court should disregard the proposed finding.

17.2 In de novo sequencing, the goal is to sequence and assemble the genome of that sample without using information from prior sequencing of that species. (PX0061 (Illumina) at 7.)

Response to Finding No. 17.2

The proposed finding is misleading because customers using Illumina NGS instruments for MCED testing—which is at issue in this proceeding—do not use Illumina's platform for de novo sequencing. MCED developers use Illumina's NGS platform to simultaneously examine thousands of cancer biomarkers in cfDNA extracted from blood plasma samples. (*See* CCFF ¶¶ 340-48). Therefore, this Court should disregard the proposed finding.

17.3 In targeted resequencing, a portion of the sequence of an organism is compared to a standard or reference sequence from previously sequenced samples to identify genetic variation. (PX0061 (Illumina) at 7; RX2264 (Illumina) at 74.)

Response to Finding No. 17.3

The proposed finding is misleading because customers using Illumina NGS instruments for MCED testing—which is at issue in this proceeding—do not use Illumina's platform for

targeted resequencing (as that term is typically employed, referring to sequencing genomic or chromosomal DNA from sources such as white blood cells). MCED developers use Illumina's NGS platform to simultaneously examine thousands of cancer biomarkers in cfDNA extracted from blood plasma samples. (*See* CCFF ¶¶ 340-48). Therefore, this Court should disregard the proposed finding.

18. Illumina's DNA sequencing technology is based on its proprietary reversible terminator-based sequencing chemistry, referred to as sequencing by synthesis (SBS) biochemistry. (PX0061 (Illumina) at 7; RX2264 (Illumina) at 154)

Response to Finding No. 18

Complaint Counsel has no specific response to the proposed finding.

18.1 SBS tracks the addition of labeled nucleotides as the DNA chain is copied in a massively parallel fashion. (PX0061 (Illumina) at 7; RX2264 (Illumina) at 154.)

Response to Finding No. 18.1

The proposed finding is vague in its use of the phrase "in a massively parallel fashion." The Illumina NovaSeq can read 20 billion DNA fragments simultaneously in a single run of the instrument. (PX0085 at 001, 003 (Illumina NovaSeq 6000 System Specifications (stating that the NovaSeq can generate 20 billion single-end reads per run using two S4 flow cells)). Therefore, this Court should disregard the proposed finding.

18.2 Illumina's SBS sequencing technology provides researchers with a broad range of applications and the ability to sequence even large mammalian genomes in a few days rather than weeks or years. (PX0061 (Illumina) at 7–8; *cf.* RX2264 (Illumina) at 156.)

Response to Finding No. 18.2

The proposed finding is vague because it does not identify the "broad range of applications" referenced. The proposed finding is misleading because customers using Illumina NGS instruments for MCED testing—which is at issue in this proceeding—do not use Illumina's platform for sequencing large mammalian genomes. MCED developers use Illumina's NGS

platform to simultaneously examine thousands of cancer biomarkers in cfDNA extracted from blood plasma samples. (*See* CCFF ¶¶ 340-48). Therefore, this Court should disregard the proposed finding.

19. Illumina's sequencing platforms can generate between 500 megabases (Mb) and 6.0 terabases (Tb) (equivalent to approximately 48 human genomes) of genomic data in a single run, depending on the instrument and application. (PX0061 (Illumina) at 8; *see also* Aravanis (Illumina) Tr. 1841.)

Response to Finding No. 19

The proposed finding is misleading because it employs the metric of bases (i.e., megabases, gigabases, or terabases) per sequencing run, which is irrelevant when utilizing NGS for liquid biopsy applications such as MCED testing, which is at issue in this case. The total output in bases of a sequencer per run of the instrument (or per period of time) is an irrelevant metric for the application of MCED tests. [redacted] Therefore, this Court should disregard the proposed finding.

20. There are different price points per gigabase (Gb) for each instrument, and for different applications, which range from small-genome, amplicon, and targeted gene-panel sequencing to population-scale whole human genome sequencing. (PX0061 (Illumina) at 8; *see also* [redacted]

Response to Finding No. 20

[redacted]

[redacted]

21. Since Illumina launched its first sequencing system in 2007, its systems have reduced the cost of sequencing by a factor of more than 10,000. In addition, the sequencing time per Gb has dropped by a factor of approximately 12,000. (PX0061 (Illumina) at 8, 14.)

Response to Finding No. 21

Complaint Counsel has no specific response to the proposed finding.

22. In 2018, 2019, and 2020, total sequencing revenue comprised 83%, 87%, and 89%, respectively, of total revenue. (PX0061 (Illumina) at 8; *see also* PX0091 (Illumina) at 11.)

Response to Finding No. 22

The proposed finding is vague because it does not define "sequencing revenue." The proposed finding is misleading to the extent it suggests that post merger Illumina will not have the incentive to foreclose access or raise costs of Illumina NGS to GRAIL's MCED rivals in order to hurt their competitiveness and cause them to lose sales to GRAIL. [redacted] Therefore, this Court should disregard the proposed finding.

23. [redacted]

Response to Finding No. 23

[redacted]

24. Arrays. Arrays are used for a broad range of DNA and RNA analysis applications, including SNP genotyping, CNV analysis, gene expression analysis, and methylation analysis, and enable the detection of millions of known genetic markers on a single array. (PX0091 (Illumina) at 15; *see also* PX7072 (deSouza (Illumina) IHT at 55).)

Response to Finding No. 24

The proposed finding is vague and misleading. It is vague because it does not define "SNP genotyping," "CNV analysis," "gene expression analysis," and "methylation analysis," with any specificity. It is misleading because microarray technologies test DNA fragments for the presence of predefined target sequences. (CCFF ¶ 1407). To say that microarrays "enable the detection of millions of known genetic markers on a single array," is to obfuscate that, in fact, microarrays determine whether specific sequences are present within a sample, and they do not provide precise readouts of the sequence of nucleotides contained within fragments of DNA. (*See* CCFF ¶ 1410; *see also* PX7070 (Felton (Thermo Fisher) IHT at 20-21) ("The microarray technology provides for…hypothesis-based experiments primarily for gene expression, genotyping, and copy. By that we mean, you have to know something about the sequences that you're trying to interrogate to place them onto the array to be detected; whereas, next-generation sequencing is a so-called hypothesis-free technology in which you do not have to understand the sequences that you are trying to interrogate. You just sequence them directly.")). [redacted] Therefore, this Court should disregard the proposed finding.

24.1 Arrays are the primary technology used in consumer genomics applications. (PX0061 (Illumina) at 8; *see also* PX7076 (Berry (Illumina) Dep. at 158); *cf.* Berry (Illumina) Tr. 805.)

Response to Finding No. 24.1

[redacted]

[redacted]

24.2 Illumina's BeadArray technology combines microscopic beads and a substrate in a proprietary manufacturing process to produce arrays that can perform many assays simultaneously. (PX0061 (Illumina) at 8; *see* PX0091 (Illumina) at 16.) This facilitates large-scale analysis of genetic variation and biological function in a unique, high-throughput, cost-effective, and flexible manner. (PX0061 (Illumina) at 8; *see* PX0091 (Illumina) at 16.)

Response to Finding No. 24.2

[redacted]

[redacted]

24.3 In 2018, 2019 and 2020, total array revenue comprised 17%, 13% and 11%, respectively, of total revenue. (PX0061 (Illumina) at 8; *see* PX0091 (Illumina) at 16.)

Response to Finding No. 24.3

Complaint Counsel does not disagree with the proposed finding to the extent it refers to Illumina's revenues.

25. Consumables. Illumina has developed various library preparation and sequencing kits to simplify workflows and accelerate analysis. (PX0061 (Illumina) at 8; *see also* deSouza (Illumina) Tr. 2313, 2355–56; Berry (Illumina) Tr. 826–27, 844–85, 928; PX0091 (Illumina) at 15; [redacted]).)

Response to Finding No. 25

[redacted]

25.1 Illumina's sequencing applications include whole-genome sequencing kits, which sequence entire genomes of any size and complexity, and targeted resequencing kits, which can sequence exomes, specific genes, RNA or other genomic regions of interest. (PX0061 (Illumina) at 8; *see also* [redacted]; Berry (Illumina) Tr. 822–24; Aravanis (Illumina) Tr. 1958–59; [redacted]); PX0091 (Illumina) at 21.)

Response to Finding No. 25.1

Complaint Counsel does not disagree with the proposed finding.

25.2 Illumina's sequencing kits maximize the ability of its customers to characterize the target genome accurately and are sold in various configurations, addressing a wide range of applications. (PX0061 (Illumina) at 8; *see also* [redacted]; PX7076 (Berry (Illumina) Dep. at 67–68).)

Response to Finding No. 25.2

Complaint Counsel does not disagree with the proposed finding.

25.3 Customers use Illumina's array-based genotyping consumables for a wide range of analyses, including diverse species, disease-related mutations and genetic characteristics associated with cancer. (PX0061 (Illumina) at 8; *see also* deSouza (Illumina) Tr. 2325–26; PX0091 (Illumina) at 24; PX7076 (Berry (Illumina) Dep. at 158).)

Response to Finding No. 25.3

The proposed finding is vague. It is vague because it does not identify or specify which Illumina "array-based genotyping consumables" are used in the listed analyses. Therefore, this Court should disregard the proposed finding.

25.4 Customers can select from a range of human, animal, and agriculturally relevant genome panels or create their own custom arrays to investigate millions of genetic markers targeting any species. (PX0061 (Illumina) at 8; *see also* PX7076 (Berry (Illumina), Dep. at 163–64).)

Response to Finding No. 25.4

The proposed finding is vague and misleading. It is vague because it refers, in turn, to "a range of human, animal, and agriculturally relevant genome panels," and "any species," without quantifying "range," or specifying "any" respectively. Therefore, this Court should disregard the proposed finding.

26. Services. Illumina provides whole-genome sequencing, genotyping, NIPT, and product support services. (PX0061 (Illumina) at 9; *see also* Berry (Illumina) Tr. 866–68; [redacted] at 24, [redacted].)

Response to Finding No. 26

[redacted]

27. Illumina's CLIA-certified, CAP-accredited laboratory provides human whole-genome sequencing services. (PX0061 (Illumina) at 9; *see also* [redacted] PX7073 (Aravanis (Illumina) IHT at 32).) Using Illumina's services, customers can perform whole-genome sequencing projects and microarray projects (including large-scale genotyping studies and whole-genome association studies). (PX0061 (Illumina) at 9; *see also* PX0091 (Illumina) at 24.)

Response to Finding No. 27

[redacted]

28. Illumina also provides NIPT services through its partner laboratories that direct samples to Illumina on a test send-out basis in Illumina's CLIA-certified, CAP-accredited laboratory. (PX0061 (Illumina) at 9; PX7063 (Berry (Illumina) IHT at 24, 207–08).)

Response to Finding No. 28

The proposed finding is vague because it does not define the terms "test send-out basis," "CLIA-certified," and "CAP-accredited." Therefore, this Court should disregard the proposed finding.

29. In addition, Illumina also offers support services to customers who have purchased its products. (PX0061 (Illumina) at 9; *see also* PX7076 (Berry (Illumina) Dep. at 58–59, 87–88, 108–109); PX7063 (Berry (Illumina) IHT at 14).)

Response to Finding No. 29

The proposed finding is vague because it is not clear what constitutes "support services." Therefore, this Court should disregard the proposed finding.

30. Clinical Applications. Through its Lab Services division, Illumina offers clinical sequencing services, including NIPT testing, direct-to-consumer ("DTC") genomic testing, more recently, COVID testing, and its TruSight series of therapy selection tests, including TSO-500. (*See* PX0091 (Illumina) at 17–24.)

Response to Finding No. 30

The proposed finding is vague because the terms "clinical sequencing" and "direct-to-consumer genomic testing" are not defined. Therefore, this Court should disregard the proposed

finding.

30.1 The first COVID-19 viral sequence was on an Illumina machine and now genomic surveillance has emerged as a critical tool in the global fight against the pandemic, with over 70 countries now using Illumina platforms for COVID-19 variant tracking. (PX0377 (Illumina) at 2; *see also* Aravanis (Illumina) Tr. 1950–51; [redacted]

Response to Finding No. 30.1

[redacted]

4. **Research and Development, Marketing and Distribution**

31. Research and Development. Illumina has historically made substantial investments in research and development. (PX0061 (Illumina) at 9; Aravanis (Illumina) Tr. 1949–50; deSouza (Illumina) Tr. 2354–55.) Illumina's research and development efforts prioritize continuous innovation coupled with product evolution. (PX0061 (Illumina) at 9; deSouza (Illumina) Tr. 2328–30, 2353; Aravanis (Illumina) Tr. 1948.)

Response to Finding No. 31

The proposed finding is vague because the term "substantial" is ambiguous; it is not clear what constitutes a substantial investment. Therefore, this Court should disregard the proposed finding.

31.1 Illumina's research and development expense in 2020, 2019, and 2018 was $682 million, $647 million, and $623 million, respectively. (PX0061 (Illumina) at 9; Aravanis (Illumina) Tr. 1948; deSouza (Illumina) Tr. 2354.)

Response to Finding No. 31.1

Complaint Counsel has no specific response to this proposed finding.

31.2 Illumina expects research and development expense to increase during 2021 to support business growth and continuing expansion in research and product-development efforts. (PX0061 (Illumina) at 9.)

Response to Finding No. 31.2

Complaint Counsel has no specific response to this proposed finding.

31.3 Illumina's research and development efforts have enabled Illumina to dramatically lower the cost of sequencing over time. (deSouza (Illumina) Tr. 2327–31.)

Response to Finding No. 31.3

The proposed finding is vague and unsupported. It relies solely upon the self-serving testimony of Illumina CEO Francis deSouza to assert that Illumina's research and development efforts have enabled it to dramatically lower the cost of sequencing over time. Additionally, the terms "dramatically" and "over time" are ambiguous. It is not clear how much the cost of sequencing has decreased over how many years. Therefore, this Court should disregard the proposed finding.

32. Marketing and Distribution. Illumina markets and distributes its products directly to customers in North America, Europe, Latin America, and the Asia-Pacific region. (PX0061 (Illumina) at 9; *cf.* deSouza (Illumina) Tr. 2373–74; PX7076 (Berry (Illumina) Dep. at 50).) In addition, Illumina sells through life-science distributors in certain markets within Europe, the Asia-Pacific region, Latin America, the Middle East, and Africa. (PX0061 (Illumina) at 9; *see also* PX7107 (deSouza (Illumina) Dep. at 79–80).)

Response to Finding No. 32

The proposed finding is vague because it does not define the term "life-science distributors"; does not specify what markets are included in "certain markets"; and does not identify what products it allegedly distributes. Therefore, this Court should disregard the proposed finding.

5. **Competition**

33. Illumina faces intense competition, which could render is products obsolete, result in significant price reductions, or substantially limit the volume of products that Illumina sells. (PX0061 (Illumina) at 10; *see also* deSouza (Illumina) Tr. 2331–32, 2385–86; Aravanis (Illumina) Tr. 1855–58; [redacted]

Response to Finding No. 33

[redacted]

[redacted]

34. Illumina competes with third parties that manufacture and market products and services for analysis of genetic variation and biological function. (PX0061 (Illumina) at 10, 14.) For instance, these competitors offer products and services for sequencing, SNP genotyping, gene expression, and molecular diagnostics markets, including PCR platforms, microarray platforms and proteomics platforms. (PX0061 (Illumina) at 10; *see also* deSouza (Illumina) Tr. 2318–20; *cf.* Berry (Illumina) Tr. 813.)

Response to Finding No. 34

The proposed finding is vague, misleading, incomplete, and unreliable, and it should be disregarded. It is vague because it does not define "genetic variation and biological function," "SNP genotyping," "gene expression," or "molecular diagnostics markets." It relies in part on the self-serving testimony of Mr. deSouza and Ms. Berry, Illumina executives who receive additional financial compensation as a result of the Transaction.

It is misleading and incomplete to the extent that it suggests that Illumina faces any meaningful competition to serve MCED test developers or that Illumina is not the dominant provider of NGS instruments and reagents across all markets. Illumina considers itself "the global leader in sequencing- and array-based solutions for genetic and genomic analysis." (PX0061 at 005 (Illumina 2020 Form 10-K)). Several market participants refer to Illumina as the "dominant" supplier in the NGS space. [redacted]

Moreover, Illumina is the only viable NGS sequencing option for MCED tests developers, as evidenced by the fact that [redacted] Further, sufficient and timely entry of a new short-read NGS platform that is suitable for MCED test developers is unlikely. (*see* CCFF ¶¶ 1501-1767). Therefore, it is clear that Illumina does not face "intense competition," and it faces no competition at all to serve MCED test developers.

In addition, MCED market participants, as well as Illumina itself, have testified that non-NGS options, such as PCR platforms and microarray platforms, are not viable substitutes for MCED test developers. (*see* CCFF ¶¶ 1399-1500). Illumina materials state that no other DNA analysis technology can analyze as many DNA fragments as NGS or characterize almost all biomarkers contained within each fragment like NGS. (*See* PX0120 at 001 (Illumina, Advantages of next-generation sequencing vs. qPCR) (". . . qPCR can only detect known sequences. In contrast, NGS is a hypothesis-free approach that does not require prior knowledge of sequence information."); *see also* PX7097 (Felton (Thermo Fisher) Dep. at 39) (testifying that PCR is generally not used to detect unknown variants)). MCED test developers, such as

[redacted]

35. In some cases, Illumina competes for the resources its customers allocate for purchasing a wide range of sequencing and non-sequencing products used to analyze genetic variation and biological function, some of which are complementary or adjacent to Illumina's own; in other cases, Illumina's products face direct competition as customers choose among sequencing and non-sequencing products that are designed to address the same use case or answer the same biological question. (PX0061 (Illumina) at 10; *see also* deSouza (Illumina) Tr. 2323–26; [redacted]).)

Response to Finding No. 35

[redacted]

[redacted]

[redacted]

36. Some of Illumina's competitors have, or will have, substantially greater financial, technical, research, and other resources than Illumina does, along with larger, more established marketing, sales, distribution, and service organizations. (PX0061 (Illumina) at 10; *see also* deSouza (Illumina) Tr. 2311–12; *cf.* Aravanis (Illumina) Tr. 1857–61.) In addition, they may have greater name recognition than Illumina does in the markets Illumina addresses, and in some cases a larger installed base of systems. (PX0061 (Illumina) at 10.)

Response to Finding No. 36

The proposed finding is vague, misleading, incomplete, unsupported, and unreliable, and it should be disregarded. It is vague because it does not define "other resources," or which markets it is referring to by "the markets Illumina addresses." It relies in part on the self-serving

testimony of Mr. deSouza and Dr. Aravanis, Illumina executives who receive additional financial compensation as a result of the Transaction. It is also unsupported because it merely copies a line from Illumina's 2021 Form 10-K, and the cited trial testimony does not contain anything relevant to these arguments.

It is misleading and incomplete to the extent that it suggests that Illumina faces any meaningful competition to serve MCED test developers or that Illumina is not the dominant provider of NGS instruments and reagents across all markets. Illumina considers itself "the global leader in sequencing- and array-based solutions for genetic and genomic analysis." (PX0061 at 005 (Illumina 2020 Form 10-K)). Several market participants refer to Illumina as the "dominant" supplier in the NGS space. [redacted]

Moreover, Illumina is the only viable NGS sequencing option for MCED tests developers, as evidenced by the fact that [redacted] Further, sufficient and timely entry of a new short-read NGS platform that is suitable for MCED test developers is unlikely. (*See* CCFF ¶¶ 1501-1767). Therefore, it is clear that Illumina does not face "intense competition," and it faces no competition at all to serve MCED test developers. It is also well known in the MCED testing space that, as Dr. Chahine of Helio testified, the Illumina platform is "by far [ ] the preferred one that's used even at third-party shops" and the "leading one for many different [ ] reasons."

(Chahine (Helio) Tr. 1044).

In addition, MCED market participants, as well as Illumina itself, have testified that non-NGS options, such as PCR platforms and microarray platforms, are not viable substitutes for MCED test developers. (*See* CCFF ¶¶ 1399-1500). Illumina materials state that no other DNA analysis technology can analyze as many DNA fragments as NGS or characterize almost all biomarkers contained within each fragment like NGS. (*See* PX0120 at 001 (Illumina, Advantages of next-generation sequencing vs. qPCR) (". . . qPCR can only detect known sequences. In contrast, NGS is a hypothesis-free approach that does not require prior knowledge of sequence information."); *see also* PX7097 (Felton (Thermo Fisher) Dep. at 39) (testifying that PCR is generally not used to detect unknown variants)). MCED test developers, such as

[redacted]

37. Illumina expects new competitors to emerge and the intensity of competition to increase as existing companies develop new or improved products and as new companies enter the market with new technologies. (Aravanis (Illumina) Tr. 1860–61, 1866; Berry (Illumina) Tr. 813; PX7079 (Flatley (Illumina) Dep. at 57–58); PX2017 (Illumina) at 40, 43; [redacted]; PX0061 (Illumina) at 10, 15.) One or more of Illumina's competitors may render one or more of Illumina's technologies obsolete or uneconomical. (PX0061 (Illumina) at 15; *see also* Aravanis (Illumina) Tr. 1854–58.)

Response to Finding No. 37

[redacted]

[redacted]

38. In the NGS space in particular, Illumina expects there will be intensifying competition in the near future both from incumbent players and new entrants. (deSouza (Illumina) Tr. 2318–20.)

Response to Finding No. 38

The proposed finding is vague, misleading, incomplete, and unreliable, and it should be

disregarded. It is vague because it does not define "intensifying competition." It relies in part on the self-serving testimony of Ms. Berry and Dr. Aravanis, Illumina executives who receive additional financial compensation as a result of the Transaction.

It is misleading and incomplete to the extent that it suggests that Illumina faces any meaningful competition to serve MCED test developers or that Illumina is not the dominant provider of NGS instruments and reagents across all markets. Illumina considers itself "the global leader in sequencing- and array-based solutions for genetic and genomic analysis." (PX0061 at 005 (Illumina 2020 Form 10-K)). Several market participants refer to Illumina as the "dominant" supplier in the NGS space. [redacted]

Moreover, Illumina is the only viable NGS sequencing option for MCED tests developers, as evidenced by the fact that [redacted] Further, sufficient and timely entry of a new short-read NGS platform that is suitable for MCED test developers is unlikely. (*See* CCFF ¶¶ 1501-1767). Therefore, it is clear that Illumina does not face "intense competition," and it faces no competition at all to serve MCED test developers. It is also well known in the MCED testing space that, as Dr. Chahine of Helio testified, the Illumina platform is "by far [ ] the preferred one that's used even at third-party shops" and the "leading one for many different [ ] reasons." (Chahine (Helio) Tr. 1044). Therefore, this Court should disregard the proposed finding.

B. GRAIL

1. Overview

39. GRAIL is a healthcare company focused on saving lives and improving health by pioneering new technologies for early cancer detection. (PX0043 (GRAIL) at 4.) Using its platform technology, GRAIL has developed a multi-cancer early detection blood test that has demonstrated in clinical studies the ability to detect more than 50 types of cancer, across all stages, and localize the cancer signal with a high degree of accuracy, from a single blood draw. (PX0043 (GRAIL) at 4.)

Response to Finding No. 39

The proposed finding is outright false, unsupported, incomplete, misleading, and vague. There is no clinical evidence that Galleri can provide early detection of 50+ cancers in an asymptomatic population. Nor is there clinical evidence that Galleri can provide early detection of 20 cancers in an asymptomatic population, or ten, or even eight. As of trial, Galleri had been clinically shown to detect only seven types of early stage cancer in an asymptomatic screening population – a fact conceded by Respondents' own expert. ((Cote Tr. 4000-4001) ("Q. So as of today, Galleri has been clinically shown to detect seven types of stage one through three cancer in an asymptomatic screening population, correct? A. That's correct."); *see generally* CCFF ¶¶ 6206-6394 (Appendix B: Galleri Has Not Been Clinically Shown to Provide Early Detection of More Than 50 Cancers in an Asymptomatic Population)).

Respondents seek to conflate the detection of cancer signals among previously diagnosed cancer patients (including many with Stage IV cancer) with the clinically relevant issue of an MCED test's capability to identify early-stage cancers in an asymptomatic screening population. Galleri is being developed (1) as a multi-cancer early detection test (2) for use in screening an asymptomatic population. (*See, e.g.*, RPFF ¶ 342 (stating that Galleri "is designed to detect cancer . . . before a patient ever shows symptoms")). The fact that Galleri can detect signals for certain cancers once those cancers reach Stage IV does not support Galleri's ability to detect

those cancers early. (*See, e.g.*, CCFF ¶ 6223). Respondents' own expert conceded that Stage IV cancer "is almost always incurable and will eventually result in the death of the patient." (RX3869 (Cote Rebuttal Report) ¶ 31). Likewise, the fact that Galleri can detect signals for certain cancers among individuals who have already been diagnosed with cancer does not support Galleri's ability to detect those cancers in an asymptomatic screening population.

Grail has released results from two clinical studies of Galleri: the CCGA study and the PATHFINDER study. (Aravanis (Illumina) Tr. 1891-92; Cote, Tr. 3993). The CCGA study did not involve a real-world population but rather was a case-control study that assessed Galleri's ability to detect cancer signals in individuals who had already been diagnosed with cancer. (*See* CCFF ¶¶ 6238-6241). Grail's Chief Medical Officer, Dr. Ofman, conceded at trial that the CCGA study did not involve the intended use population for Galleri. (Ofman (Grail) Tr. 3294-95). The authors of the CCGA-3 sub-study – which Respondents rely upon for their 50-cancer claims – make this point explicitly in their article, cautioning that "CCGA is a case-control study, and as such, is not reflective of performance in a screening population." (RX3409 at 010 (E.A. Klein, et al., Clinical Validation of a Targeted Methylation-Based Multi-Cancer Early Detection Test Using an Independent Validation Set, 9 Annals of Oncology 1167 (2021)). The authors of the CCGA-2 sub-study provide the same caveat about CCGA, stating: "to understand [Galleri's] performance in an asymptomatic screening population will require additional studies" beyond CCGA. (RX3430 at 10 (M.C. Liu, et al., Sensitive and Specific Multi-Cancer Detection and Localization Using Methylation Signatures in Cell-Free DNA, 6 Annals of Oncology 745 (2020)). The only other study of Galleri for which interim results have been released, PATHFINDER, likewise fails to support the notion that Galleri can provide early detection of 50+ cancers in an asymptomatic population. Grail's Chief Medical Officer, Dr. Ofman,

acknowledged the challenges associated with generating the clinical evidence necessary to actually support a 50-cancer early screening claim when he admitted: "To find all 50 cancer types in a real-world population would require hundreds of thousands of people, and PATHFINDER was not designed to do that." (RPFF ¶ 398.4 (quoting Ofman (Grail) Tr. 3298). Based on the PATHFINDER study, the Galleri test has been shown to detect seven types of Stage I-III cancer in an asymptomatic screening population. (Cote Tr. 4000-01; RX3041 at 005 (Tomasz Beer, Interim Results of Pathfinder, a Clinical Use Study Using a Methylation-Based Multi-Cancer Early Detection Test, June 4, 2021).

The proposed finding is incomplete and misleading to the extent it suggests that Galleri's cancer signal of origin ("CSO") performance has been clinically established in Galleri's intended use population. Reliable clinical data does not yet exist about how Grail's cancer signal of origin feature would perform in an asymptomatic screening population. The CSO accuracy numbers reported in CCGA do not indicate the likelihood that a particular CSO prediction accurately identifies the location of an individual's' cancer because (1) CCGA did not involve an asymptomatic screening population, (2) the study excluded false positives when assessing CSO accuracy, and (3) Grail counts Galleri's CSO predictions as "correct" even in instances when Galleri does not actually identify the location of the underlying cancer. (*See* Complaint Counsel's Post-Trial Reply Brief at 50-54). Additionally, Galleri's CSO prediction feature does not obviate the need for additional diagnostic evaluation, including diagnostic imaging such as PET-CT. (*See* PX0063 at 002 (Grail, https://grail.com/galleri, accessed Apr. 29, 2021) ("A test result of 'Cancer Signal Detected' requires confirmatory diagnostic evaluation by medically established procedures (e.g. imaging) to confirm cancer").

The CCGA study did not involve a real-world population, but rather was a case-control

study that involved individuals who had already been diagnosed with cancer. (*See* CCFF ¶¶ 6238-6241). Grail's Chief Medical Officer, Dr. Ofman, conceded at trial that the CCGA study did not involve the intended use population for Galleri. (Ofman (Grail) Tr. 3294-95). The authors of the Grail's CCGA-2 and CCGA-3 sub-studies themselves acknowledge that CCGA is not reflective of performance in a screening population. RX3430 at 10 (M.C. Liu, et al., Sensitive and Specific Multi-Cancer Detection and Localization Using Methylation Signatures in Cell-Free DNA, 6 Annals of Oncology 745 (2020) [CCGA-2] ("[T]o understand [Galleri's] performance in an asymptomatic screening population will require additional studies" beyond CCGA.")); (RX3409 at 010 (E.A. Klein, et al., Clinical Validation of a Targeted Methylation-Based Multi-Cancer Early Detection Test Using an Independent Validation Set, 9 Annals of Oncology 1167 (2021) [CCGA-3] ("CCGA is a case-control study, and as such, is not reflective of performance in a screening population.")). Among other factors, some of the blood samples in CCGA were "collected from participants with cancer after biopsies had been carried out," which the authors note "could increase the possibility that the tumor cfDNA fraction may increase relative to before the biopsy." Galleri's reported tissue of origin accuracy was worse for Stage I-II cancers than for Stage III-IV cancers in CCGA (*See* RX3430 at 6, Figure 4 (M.C. Liu, et al., Sensitive and Specific Multi-Cancer Detection and Localization Using Methylation Signatures in Cell-Free DNA, 6 Annals of Oncology 745 (2020) [CCGA-2]). This fact suggests that Galleri's CSO performance will be worse in an asymptomatic screening population that does not include previously diagnosed Stage III and Stage IV cancer patients, as the CCGA study did.

The proposed finding is also vague because the phrase "high degree of accuracy" is undefined and unexplained. Therefore, this Court should disregard the proposed finding.

2. **Formation**

40. In February 2013, Illumina acquired Verinata, a company that had developed a noninvasive prenatal test ("NIPT") for fetal chromosomal abnormalities using a blood sample. (RX3337 (Illumina) at 1.) In the first 100,000 women that received the non-invasive prenatal test from Verinata, some unusual signs were identified: in a handful of cases, a signal was detected in the mother's blood that was initially believed to be a false signal indicating a genetic abnormality in the fetus. (Aravanis (Illumina) Tr. 1868–69; *see generally* RX2547 (Bianchi et al., 2015).)

Response to Finding No. 40

The proposed finding is vague and misleading and should be disregarded. It is vague because it lacks context and does not define the term "unusual signs." It is also misleading to the extent that it suggests that Illumina's acquisition of Verinata was the source of discovery leading to Galleri. This erroneous claim is flatly contradicted by record evidence. First, multiple other individuals were already exploring the potential use of cfDNA for an MCED test well before Illumina's acquisition of Verinata in 2013. For example, Dr. Dave Alquist, a gastroenterologist at Mayo Clinic, conducted research for years looking for biomarkers that could provide early detection of colon cancer. (CCFF ¶ 357). In March 2009, Dr. Ahlquist told Exact's CEO, Kevin Conroy, of his vision for detecting many or most cancers from a simple blood draw. (CCFF ¶ 358). Dr. Ahlquist called this vision a "pan-cancer" test, which would look for tiny fragments of cancer DNA in a patient's blood. (CCFF ¶ 358). Dr. Ahlquist's vision for a pan-cancer test was the genesis of Exact's mission to detect cancer earlier, (CCFF ¶ 359), [redacted] At the same time Exact was working with Dr. Ahlquist on its MCED test, Dr. Bert Vogelstein's lab at Johns Hopkins University "published the first description of cancer genomes, what we called cancer genome landscapes" in approximately 2009 or 2010. (CCFF ¶ 361). Dr. Vogelstein was awarded the international prize from the American Association of Cancer Research for "pioneering the development of liquid biopsies," (CCFF ¶ 363), and he ran

clinical studies to demonstrate the ability from a single blood draw to detect cancer earlier across many different types of cancer. (CCFF ¶ 365). Ultimately, Dr. Vogelstein became a co-founder of Thrive, (CCFF ¶ 366), and his discoveries led to the creation of Thrive's CancerSEEK MCED test. (CCFF ¶ 364).

Second, Illumina's internal documents directly contradict its claims that the Verinata transaction was the source of the discovery leading to Galleri. Specifically, Dr. Gao, Singlera's Co-Founder and current Scientific Advisor, and Dr. Dennis Lo, a professor at the Chinese University of Hong Kong, published a paper in the Proceedings of National Academy of Science journal in 2008 presenting research on the detection of fetus chromosome trisomy using cfDNA. (CCFF ¶ 354). Dr. Gao used the research from his 2008 paper with Dr. Dennis Lo to begin research on the use of cfDNA for cancer screening. (CCFF ¶ 354). As early as 2009, Dr. Gao published a paper on DNA methylation for use in applications such as cancer detection in 2009 with Singlera co-founder Professor Kun Zhang of the University of California San Diego. (CCFF ¶ 355). By 2012, Dr. Lo's research caught the attention of Illumina. In August 2012, Illumina's Director of Corporate and Venture Development, Robert Bookstein, wrote to Illumina's SVP of Corporate and Venture Development, Nicholas Naclerio, to alert Naclerio of research by Dr. Dennis Lo. (CCFF ¶ 369). Bookstein wrote to Dr. Naclerio that he thought that Dr. Lo's method of detecting cancer through cfDNA "could be built into a business rivaling or exceeding [noninvasive prenatal testing]," (CCFF ¶ 371), and suggested that Illumina "scoop up [Dr. Lo's] entire IP portfolio and build it inside Illumina." (CCFF ¶ 372). Just one month later, Illumina held a call with Dr. Dennis Lo relating to his discovery that cancer signals could be detected through cfDNA and sought to review Dr. Lo's "filed patent applications." (CCFF ¶ 373). In notes from the call, Illumina's attendees wrote the question, "How will a clinician use

this type of data?" (CCFF ¶ 373). Responses to the question included "*Blood biopsy – non-invasive screening" and "Potential for detecting cancer prior to actual detection of a primary tumor*." (CCFF ¶ 363 (emphasis added)). Therefore, this Court should disregard the proposed finding.

41. Meredith Halks-Miller, the laboratory director at Illumina, approached Illumina's leadership about these unusual signals. (PX7048 (Klausner (GRAIL) IHT at 49–50.) Illumina formed a team and a program to evaluate these signals to follow up with patients and prescribing physicians and discovered that these women had undiagnosed cancer. (Aravanis (Illumina) Tr. 1868–69, 1873–74; PX7079 (Flatley (Illumina) Dep. at 35–37; PX7048 (Klausner (GRAIL) IHT at 49–50.) This discovery led to the realization that early cancer could be detected in the blood. (Aravanis (Illumina) Tr. 1868–69, 1873–74; PX7079 (Flatley (Illumina) Dep. at 35–37; PX7048 (Klausner (GRAIL) IHT at 49–50.)

Response to Finding No. 41

[redacted]

42. At the same time, Illumina was developing a liquid biopsy technology to look at cancer signals in late-stage cancer for the purposes of therapy selection for advanced cancer patients. (Aravanis (Illumina) Tr. 1869.) There was data from that project which applied to some early-stage cancer samples that also suggested early-stage cancer detection might be possible. (Aravanis (Illumina) Tr. 1869.)

Response to Finding No. 42

Complaint Counsel has no specific response to the proposed finding.

43. Because of the aforementioned discoveries, Illumina decided to pursue the early detection of cancer in the blood. (Aravanis (Illumina) Tr. 1868–69; PX7079 (Flatley (Illumina) Dep. at 35–37; PX7048 (Klausner (GRAIL) IHT) at 49–50.)

Response to Finding No. 43

Complaint Counsel has no specific response to the proposed finding.

44. In 2015, Illumina formed GRAIL with the goal of achieving the "holy GRAIL" in the war on cancer: a test—enabled by Illumina's sequencing technology—to detect multiple types of cancer in asymptomatic individuals through a blood draw. (Aravanis (Illumina) Tr. 1872; PX0036 (GRAIL) at 5; PX7079 (Flatley (Illumina) Dep. at 35–37); PX7104 (Aravanis (Illumina) Dep. at 159–160).)

Response to Finding No. 44

The proposed finding is unsupported to the extent that none of the cited materials establish when Grail was formed. Notwithstanding the foregoing, Complaint Counsel does not disagree that Grail was formed in 2015-2016. (*See* CCFF ¶¶ 24-39). Complaint Counsel has no specific response to the remainder of the proposed finding.

45. It was a "moonshot" ambition—as Illumina's then-CEO, Jay Flatley (Illumina), put it at the time, "GRAIL is going after a much more daunting technology, scientific and biological problem that [no other companies] to [Illumina's] knowledge . . . have even begun to address". (RX3970 (Illumina) at 10.)

Response to Finding No. 45

The proposed finding is misleading to the extent it relies only on a single statement by Illumina's then-CEO to suggest that no other companies were pursuing multi-cancer early detection tests at the time Grail was created. As the weight of the evidence shows, there were multiple companies pursuing MCED tests at or before this time. The proposed finding is also confusing to the extent the term "moonshot" and the phrase "moonshot ambition" do not appear in the cited material and are undefined. Therefore, this Court should disregard the proposed

finding.

46. By forming GRAIL, Illumina hoped to "[a]ccelerat[e] development of the ctDNA cancer screening market by 10 years". (RX1914 (Illumina) at 7.) Thus, from the start, Illumina viewed GRAIL as an extension of its core goal of expanding and accelerating adoption of NGS technology in new applications, paving the way for NGS-based screening tests and spurring innovation. (Aravanis (Illumina) Tr. 1870–71, 1905–1907; *cf.* [redacted]

Response to Finding No. 46

[redacted]

47. To position GRAIL for its moonshot objective, Illumina seeded GRAIL with the talent, R&D capabilities, development plans and data it would need to investigate how to use NGS technology for multi-cancer early detection through foundational, population-scale trials. (PX7107 (deSouza (Illumina) Dep. at 182–83).)

Response to Finding No. 47

The proposed finding is unsupported to the extent the cited deposition excerpt does not establish that Illumina provided Grail with any "development plans and data." Nor does the cited provision establish that Illumina provided Grail with sufficient resources to develop a multicancer early detection test "through foundational, population-scale trials." Therefore, this Court should disregard the proposed finding.

48. However, GRAIL would also require a substantial amount of capital to conduct the foundational clinical trials necessary to build the data sets for its machine learning algorithm. (PX7079 (Flatley (Illumina) Dep. at 92–94); PX7065 (Aravanis (Illumina) Dep. at 62–64).)

Response to Finding No. 48

Complaint Counsel has no specific response to the proposed finding.

49. Given the high risks of failure at this early stage, Illumina decided to bring in outside investors to spread the risk while ensuring GRAIL had the capital it needed to move from concept through clinical trials, and the freedom of a biotech startup to experiment and fail in pursuit of its "moonshot" objective. (Aravanis (Illumina) Tr. 1772–73; PX7079 (Flatley (Illumina) Dep. at 92–94).)

Response to Finding No. 49

Complaint Counsel has no specific response to the proposed finding.

49.1 To that end, in February 2017, Illumina completed a capital raise in connection with which Illumina reduced its stake in GRAIL to less than 20%. (RX3972 (Illumina) at 2; RX3984 (Illumina) at 14; *see* deSouza (Illumina) Tr. 2202.)

Response to Finding No. 49.1

Complaint Counsel has no specific response to the proposed finding.

50. Although Illumina reduced its investment in GRAIL in 2017, Illumina remained heavily invested in GRAIL's success. In addition to its equity stake in GRAIL (around 12% of GRAIL's outstanding shares on a fully diluted basis before the transaction closed), Illumina has a long-term agreement to supply GRAIL with NGS instruments and reagents for its genomic testing needs, and also had the right to receive approximately [redacted] of future net sales of any GRAIL oncology products or services. [redacted]; *see also* Aravanis (Illumina) Tr. 1876–77; RX3984 (Illumina) at 14–15.)

Response to Finding No. 50

[redacted]

3. **GRAIL Today**

51. By late 2020, GRAIL had built a multi-disciplinary organization of scientists, engineers, and physicians to use the power of next-generation sequencing (NGS), population-scale clinical studies, and state-of-the-art computer science and data science to overcome one of medicine's greatest challenges: detecting cancer early, when it can be cured. (PX0043 (GRAIL) at 4; *see also* Aravanis (Illumina) Tr. 1907; deSouza (Illumina) Tr. 2334–35.)

Response to Finding No. 51

The proposed finding is vague and misleading to the extent that it suggests cancer can only be cured when detected early or that cancer is always cured when detected early. Additionally, the term "state-of-the-art" is vague and ambiguous when used to describe computer science and data science.

The proposed finding is vague in stating GRAIL has built something "to overcome" one of "medicine's greatest challenges" because it is not clear what overcome means in this context. It is misleading to the extent it suggests that GRAIL has actually overcome any such challenge, because there is no clinical evidence that Galleri can provide early detection of 50+ cancers in an asymptomatic population. Nor is there clinical evidence that Galleri can provide early detection of 20 cancers in an asymptomatic population, or ten, or for that matter, eight. As of today, Galleri has been clinically shown to detect only seven types of early-stage cancer in an asymptomatic screening population – a fact conceded by Respondents' own expert. ((Cote Tr. 4000-4001) ("Q. So as of today, Galleri has been clinically shown to detect seven types of stage one through three cancer in an asymptomatic screening population, correct? A. That's correct."); *see generally* CCFF ¶¶ 6206-6394).

[redacted]

- [redacted]

[redacted]

52. Using GRAIL's platform technology, GRAIL developed a multi-cancer early detection blood test that has demonstrated in clinical studies the ability to detect more than 50 types of cancer, across all stages, and localize the cancer signal with a high degree of accuracy, from a single blood draw. (PX0043 (GRAIL) at 4; *see also* Aravanis (Illumina) Tr. 1892, 1897; deSouza (Illumina) Tr. 2335; PX7104 (Aravanis (Illumina) Dep. at 238).)

Response to Finding No. 52

The proposed finding is incomplete, misleading, and vague. There is no clinical evidence that Galleri can provide early detection of 50+ cancers in an asymptomatic population. Nor is there clinical evidence that Galleri can provide early detection of 20 cancers in an asymptomatic

population, or ten, or for that matter, eight. As of today, Galleri has been clinically shown to detect only seven types of early-stage cancer in an asymptomatic screening population – a fact conceded by Respondents' own expert. ((Cote Tr. 4000-4001) ("Q. So as of today, Galleri has been clinically shown to detect seven types of stage one through three cancer in an asymptomatic screening population, correct? A. That's correct."); *see generally* CCFF ¶¶ 6206-6394).

Respondents seek to conflate the detection of cancer signals among previously diagnosed cancer patients (including many with Stage IV cancer) with the clinically relevant issue of an MCED test's capability to identify early-stage cancers in an asymptomatic screening population. Galleri is being developed (1) as a multi-cancer *early* detection test (2) for use in screening an asymptomatic population. (*See, e.g.,* RPFF ¶ 342 (stating that Galleri "is designed to detect cancer . . . before a patient ever shows symptoms")). The fact that Galleri can detect signals for certain cancers once those cancers reach Stage IV does not support Galleri's ability to detect those cancers early. (*See, e.g.,* CCFF ¶ 6233). Respondents' own expert conceded that Stage IV cancer "is almost always incurable and will eventually result in the death of the patient." (RX3869 (Cote Rebuttal Report) ¶ 31). Likewise, the fact that Galleri can detect signals for certain cancers among individuals who have already been diagnosed with cancer does not support Galleri's ability to detect those cancers in an asymptomatic screening population. CCGA did not involve a real-world population but rather was a case-control study that assessed Galleri's ability to detect cancer signals in individuals who had already been diagnosed with cancer. (*See* CCFF ¶¶ 6238-6241). The authors of the CCGA-3 substudy – which Respondents rely upon for their 50-cancer claims – make this point explicitly in their article, cautioning that "CCGA is a case-control study, and as such, is not reflective of performance in a screening population." (RX3409 at 010 (E.A. Klein, et al., Clinical Validation

of a Targeted Methylation-Based Multi-Cancer Early Detection Test Using an Independent Validation Set, 9 Annals of Oncology 1167 (2021)). The authors of Grail's CCGA-2 study also provide the same caveat about CCGA, stating: "to understand [Galleri's] performance in an asymptomatic screening population will require additional studies" beyond CCGA. (RX3430 at 10 (M.C. Liu, et al., Sensitive and Specific Multi-Cancer Detection and Localization Using Methylation Signatures in Cell-Free DNA, 6 Annals of Oncology 745 (2020)). The only other study of Galleri for which interim results have been released, PATHFINDER, likewise fails to support the notion that Galleri can provide early detection of 50+ cancers in an asymptomatic population. Grail's Chief Medical Officer, Dr. Ofman, acknowledged the challenges associated with generating the clinical evidence necessary to actually support a 50-cancer early screening claim when he admitted: "To find all 50 cancer types in a real-world population would require hundreds of thousands of people, and PATHFINDER was not designed to do that." (RPFF ¶ 398.4 (quoting Ofman (Grail) Tr. 3298).

The proposed finding is also misleading to the extent it suggests that Galleri's algorithmic cancer signal of origin prediction is capable of definitively localizing cancer "with a high degree of accuracy, from a single blood draw." Reliable clinical data does not exist about how Grail's cancer signal of origin feature would perform in an asymptomatic screening population. The Galleri CSO accuracy numbers reported in CCGA-3 do not indicate the likelihood that a particular CSO prediction accurately identifies the location of an individual's' cancer because (1) CCGA did not involve an asymptomatic screening population, (2) the study excluded false positives when assessing CSO accuracy, and (3) Grail counts Galleri's CSO predictions as "correct" *even in instances when Galleri does not actually identify the location of the underlying cancer*. (*See* Complaint Counsel's Post-Trial Reply Brief at 50-54).

The proposed finding is also incomplete and misleading to the extent it suggests that no further diagnostic work (beyond a "single blood draw") would be necessary to determine the accuracy of a positive cancer signal reported by Galleri. [redacted] When assessed in a screening setting involving asymptomatic normal-risk participants, over half of positive Galleri results were falsely positive, meaning the test "detected" a signal for cancer among participants who did not have cancer. (*See* CCFF ¶ 6292.)

A positive Galleri result "requires confirmatory diagnostic evaluation by medically established procedures (e.g. imaging) to confirm cancer," *notwithstanding* Galleri's "cancer signal of origin" feature. (PX0063 at 002 (Grail, https://grail.com/galleri/, accessed on Apr. 29, 2021). When asked whether Galleri could "identify the cancer signal of origin just through the blood," Grail's CEO, Hans Bishop clarified that "the appropriate workup associated with that cancer signal of origin" would be required for confirmation, including the use of ultrasound and biopsy. (Bishop (Grail) Tr. 1387). Mr. Bishop testified at trial that some patients may need to undergo a body scan to identify the cancer tissue of origin. (Bishop (Grail) Tr. 1387). [redacted]

Interim results from PATHFINDER, an actual interventional trial for Galleri, indicate that additional imaging testing was required for positive results 90 percent of the time. (RX3041 at 001 (Tomasz M. Beer, Interim Results of PATHFINDER, a Clinical Use Study Using a Methylation-Based Multi-Cancer Early Detection Test, 2021 ASCO Annual Meeting Presentation, June 4, 2021) ("Most participants with diagnostic resolution had at least 1 imaging test (57/63; 90%)."). Over half the positive results in PATHFINDER with diagnostic resolution were determined to be false positives (55.4%) and 25 percent of participants who received falsely positive results underwent at least one invasive procedure. (RX3041 at 004 (Tomasz M. Beer, Interim Results of PATHFINDER, a Clinical Use Study Using a Methylation-Based Multi-Cancer Early Detection Test, 2021 ASCO Annual Meeting Presentation, June 4, 2021)). [redacted]

53. GRAIL undertook a rigorous, comprehensive, multi-omic discovery approach to explore and identify the most promising biological hallmarks of cancer. (PX0043 (GRAIL) at 4, 96; *see also* Aravanis (Illumina) Tr. 1880–81, 1916–18.)

Response to Finding No. 53

The proposed finding is vague because the terms "multi-omic" and "biological hallmarks" are not defined and the terms "rigorous," "comprehensive," and "most promising" are ambiguous. Therefore, this Court should disregard the proposed finding.

53.1 GRAIL invested significant capital and resources in its foundational studies, which have collectively enrolled approximately 115,000 participants, to build what GRAIL believes are the largest linked datasets of genomic and clinical data in the

cancer field. (PX0043 (GRAIL) at 4, 96; *see also* PX7083 (Bishop (GRAIL) Dep. at 63); PX7069 (Bishop (GRAIL) IHT at 191–92).)

Response to Finding No. 53.1

The proposed finding is vague, unsupported, and speculative. It relies solely upon Grail documents and the self-serving testimony of former Grail Hans Bishop to support Grail's speculative "belief" that it has the largest linked datasets of genomic and clinical data in the cancer field. No outside sources, academic articles, or scientific studies are cited to support this purported belief. Additionally, the term "significant" is ambiguous; it is not clear what constitutes significant capital and resources. Therefore, this Court should disregard the proposed finding.

54. In order to determine the optimal means of cancer detection, GRAIL compared the performance of three different NGS approaches—mutations, chromosomal alterations and methylation patterns—in head-to-head studies. (PX0043 (GRAIL) at 96; *see also* Aravanis (Illumina) Tr. 1880–81; [redacted]

Response to Finding No. 54

[redacted]

55. While all three markers were capable of detecting cancer, GRAIL found that methylation profiling yielded significantly better results for cancer detection than was observed by interrogating mutations or chromosomal alterations, alone or in combination. (PX0043 (GRAIL) at 96; *see also* Aravanis (Illumina) Tr. 1881; Ofman (GRAIL) Tr. 3291–92.)

Response to Finding No. 55

The proposed finding is unsupported, vague, and ambiguous. It does not cite any outside sources, academic articles, or scientific studies to support the results of Grail's purported comparison of mutations, chromosomal alterations, and methylation patterns. Furthermore, it does not define the term "chromosomal alternations" and does not quantify what "significantly better results" means. Therefore, this Court should disregard the proposed finding.

56. After comprehensive analysis of whole-genome methylation patterns, GRAIL discovered highly informative and low-noise methylation regions for cancer signal detection and localization, leading it to develop a targeted methylation approach with superior performance and lower costs than whole-genome methylation. (PX0043 (GRAIL) at 96; *see also* Aravanis (Illumina) Tr. 1891; Bishop (GRAIL) Tr. 1373; PX7104 (Aravanis (Illumina) Dep. at 182–83, 188); PX7072 [redacted] at 55, [redacted]

Response to Finding No. 56

[redacted]

57. This approach helps solve a core problem in detecting cancer early in asymptomatic individuals: the low level of cancer signal circulating in the blood. (PX0043 (GRAIL) at 96; [redacted] *see also* PX0036 (GRAIL) at 7.)

Response to Finding No. 57

[redacted]

[redacted]

58. While methylation profiling is the approach GRAIL is using with Galleri, it continues to evaluate multi-omic approaches including evaluation of additional analytes and biofluids. (PX0043 (GRAIL) at 96; [redacted] Ofman (GRAIL) Tr. 3301, 3303–04; [redacted]

Response to Finding No. 58

[redacted]

4. **GRAIL's Galleri Test**

59. GRAIL's multi-cancer early detection test, Galleri, is designed as a screening test for asymptomatic individuals over 50 years of age. (PX0043 (GRAIL) at 96; PX7083 (Bishop (GRAIL) Dep. at 25); PX7069 (Bishop (GRAIL) IHT at 149).) GRAIL commercially launched Galleri in May 2021 as a laboratory developed test (LDT.) (Aravanis (Illumina) Tr. 1892; Freidin Tr. 2968–69.)

Response to Finding No. 59

The proposed finding is incorrect because Grail commercially launched Galleri in June 2021. (Aravanis (Illumina) Tr. 1892; Freidin Tr. 2968–69).

60. Galleri has the potential to transform cancer care and population health. (PX0043 (GRAIL) at 5, 97; *see also* Ofman (GRAIL) Tr. 3279–80; PX7092 (Ofman (GRAIL) Dep. at 22.)

Response to Finding No. 60

The proposed finding is vague, unsupported, and misleading. The proposed finding is vague because the term "transform" is ambiguous and undefined. The proposed finding is unsupported because it relies solely on Grail's self-serving statements, uncorroborated by any neutral or third-party testimony or evidence. The proposed finding is misleading because the

primary underlying source cited, Grail's own S-1 statement, does not state that Grail "has" the potential stated, merely that Grail "*believes*" Grail has the potential stated. (*See* PX0043 (Grail) at 005, 097 (Grail 2020 Form S-1) ("*We believe* our first anticipated commercially available product, Galleri, has the potential to transform cancer care and population health.") (emphasis added)). Complaint Counsel does not disagree that MCED testing broadly is poised to revolutionize how cancer is detected and treated. However, this Court should disregard the proposed finding for the reasons stated above.

61. GRAIL has demonstrated that the Galleri test can identify over 50 types of cancers, over 45 of which lack recommended screenings. (PX0043 (GRAIL) at 97, 5; *see also* Ofman (GRAIL) Tr. 3312; Section I.A *infra*).)

Response to Finding No. 61

The proposed finding is incomplete and misleading. There is no clinical evidence that Galleri can provide early detection of 50+ cancers in an asymptomatic screening population. Nor is there clinical evidence that Galleri can provide early detection of 20 cancers in an asymptomatic population, or ten, or even eight. As of today, Galleri has been clinically shown to detect only seven types of early-stage cancer in an asymptomatic screening population – a fact conceded by Respondents' own expert. ((Cote Tr. 4000-4001) ("Q. So as of today, Galleri has been clinically shown to detect seven types of stage one through three cancer in an asymptomatic screening population, correct? A. That's correct."); *see generally* CCFF ¶¶ 6206-6394 (Appendix B: Galleri Has Not Been Clinically Shown to Provide Early Detection of More Than 50 Cancers in an Asymptomatic Population)).

Respondents seek to conflate the identification of cancer signals among previously diagnosed cancer patients (including many with Stage IV cancer) with the clinically relevant issue of an MCED test's capability to identify early-stage cancers in an asymptomatic screening population. Galleri is being developed (1) as a multi-cancer early detection test (2) for use in

screening an asymptomatic population. (*See, e.g.*, RPFF ¶ 342 (stating that Galleri "is designed to detect cancer . . . before a patient ever shows symptoms")). The proposed finding itself uses the term "screening procedure," confirming that the relevant metric is Galleri's ability to screen for cancers in asymptomatic patients. The fact that Galleri can detect signals for certain cancers once those cancers reach Stage IV does not support Galleri's ability to detect those cancers early. (*See, e.g.*, CCFF ¶ 6233). Respondents' own expert conceded that Stage IV cancer "is almost always incurable and will eventually result in the death of the patient." (RX3869 (Cote Rebuttal Report) ¶ 31). Likewise, the fact that Galleri can detect signals for certain cancers among individuals who have already been diagnosed with cancer does not support Galleri's ability to detect those cancers in an asymptomatic screening population.

Grail has released results from two clinical studies of Galleri: the CCGA study and the PATHFINDER study. (Aravanis (Illumina) Tr. 1891-92; Cote, Tr. 3993). The CCGA study did not involve a real-world population but rather was a case-control study that assessed Galleri's ability to detect cancer signals in individuals who had already been diagnosed with cancer. (*See* CCFF ¶¶ 6238-6241). Grail's Chief Medical Officer, Dr. Ofman, conceded at trial that the CCGA study did not involve the intended use population for Galleri. (Ofman (Grail) Tr. 3294-95). The authors of the CCGA-3 sub-study – which Respondents rely upon for their 50-cancer claims – make this point explicitly in their article, cautioning that "CCGA is a case-control study, and as such, is not reflective of performance in a screening population." (RX3409 at 010 (E.A. Klein, et al., Clinical Validation of a Targeted Methylation-Based Multi-Cancer Early Detection Test Using an Independent Validation Set, 9 Annals of Oncology 1167 (2021)). The authors of the CCGA-2 sub-study provide the same caveat about CCGA, stating: "to understand [Galleri's] performance in an asymptomatic screening population will require additional studies"

beyond CCGA. (RX3430 at 10 (M.C. Liu, et al., Sensitive and Specific Multi-Cancer Detection and Localization Using Methylation Signatures in Cell-Free DNA, 6 Annals of Oncology 745 (2020)). [redacted] In their own proposed findings of fact, Respondents admit that "for an early cancer screening test, whose target population comprises asymptomatic individuals who do not have a diagnosis of cancer, the clinical study cannot use samples from cancer patients" if it is to represent "valid scientific evidence used to determine the effectiveness of a device." (*See* RPFF ¶¶ 319-320).

The only other study of Galleri for which interim results have been released, PATHFINDER, likewise fails to support the notion that Galleri can provide early detection of 50+ cancers in an asymptomatic population. Grail's Chief Medical Officer, Dr. Ofman, acknowledged the challenges associated with generating the clinical evidence necessary to actually support a 50-cancer early screening claim when he admitted: "To find all 50 cancer types in a real-world population would require hundreds of thousands of people, and PATHFINDER was not designed to do that." (RPFF ¶ 398.4 (quoting Ofman (Grail) Tr. 3298). Based on the PATHFINDER study, the Galleri test has been shown to detect seven types of Stage I-III cancer in an asymptomatic screening population. (Cote Tr. 4000-01; RX3041 at 005 (Thomasz Beer, Interim Results of Pathfinder, a Clinical Use Study Using a Methylation-Based Multi-Cancer Early Detection Test, June 4, 2021).

Finally, Complaint Counsel notes that the proposed finding is unreliable because

Respondents cite a Grail financial filing and the self-serving testimony of a Grail executive for the proposed finding, rather than providing specific references to the clinical studies themselves. For the above reasons, the proposed finding should be disregarded.

62. Data shows that when Galleri detects cancer, it is also able to localize the cancer signal with high accuracy. (*See* Bishop (GRAIL) Tr. 1387, [redacted]

Response to Finding No. 62

[redacted]

62.1 In the second sub-study (CCGA-2) of GRAIL's foundational Circulating Cell-Free Genome Atlas Study (CCGA), when a cancer signal was detected, an earlier version of Galleri localized the cancer signal in 96% of the samples, and of these, Galleri correctly localized the cancer signal in 93%. (PX0043 (GRAIL) at 5, 97;

Response to Finding No. 62.1

[redacted]

[redacted]

[redacted]

62.2 Early data also suggested that indolent cancers are unlikely to be detected by Galleri, potentially reducing the problem of treating over-diagnosed cancers. (PX0043 (GRAIL) at 97, 5; *see also* Ofman (GRAIL) Tr. 3289–3290.)

Response to Finding No. 62.2

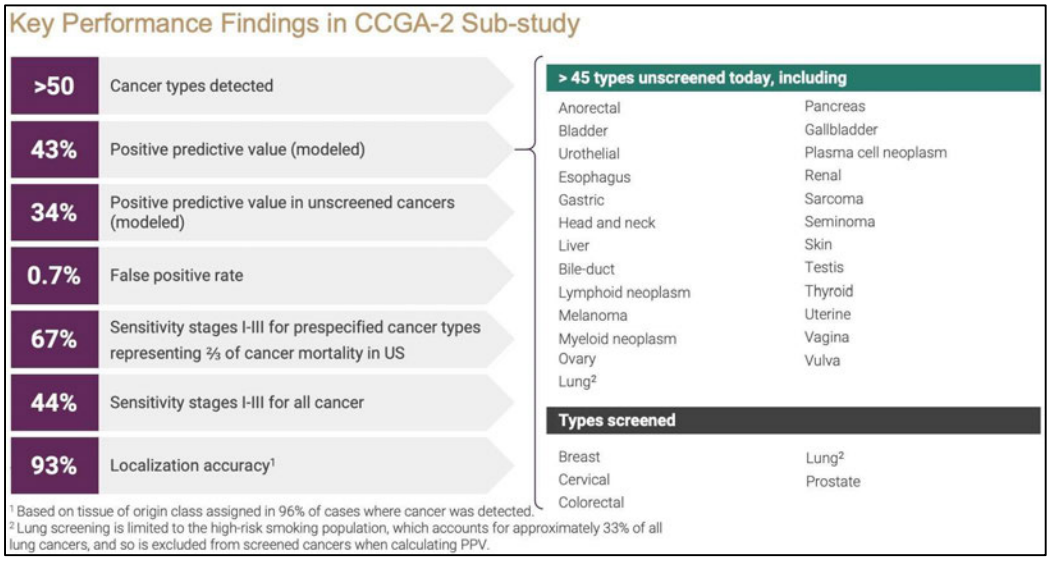
The proposed finding is vague and unreliable. The proposed finding is vague because the term "indolent" is not defined. The proposed finding is also vague because the phrase "early data" and "suggested" are undefined; it is unclear to what data Respondents are referring. Additionally, the proposed finding is unreliable because it fails to cite any underlying data, but instead relies solely on an (uncited) statement in a Grail SEC filing and the self-serving testimony of a Grail executive.

Grail's CCGA study included two types of participants in its cancer arm. Over 70 percent of participants in the cancer arm were identified by "clinical presentation." (*See* CCFF ¶¶ 6244-45). The reminder were diagnosed via other screening tests. Galleri's sensitivity was over three times higher in CCGA-3 for cancer participants diagnosed through "clinical presentation" than for cancer participants diagnosed via other screening tests. (*See* RX3409 at 005 (E. A. Klein et al., *Clinical Validation of a Targeted Methylation-Based Multi-Cancer Early Detection Test Using an Independent Validation Set*, Annals of Oncology (2021) (stating that "overall sensitivity in cancers identified by clinical presentation [63.9% (61.8% - 66.0%)] was higher than that in cancers identified by screening tests [18.0% (15.5% - 20.8%)]")).

It is possible that by "indolent cancers," Respondents mean asymptomatic cancers that have not been previously identified by clinical presentation. Galleri did indeed perform far

worse in the CCGA study at detecting cancers for which there had not yet been "clinical presentation." If that is what Respondents mean, it is a shortcoming, not a strength. The entire point of an MCED test is to identify cancer early in asymptomatic individuals before they would otherwise learn of their cancer through clinical manifestation and diagnosis. The fact that Galleri performed far worse at detecting cancer in this cohort of CCGA does not mitigate a problem; it is itself a problem. For the above reasons, this Court should disregard the proposed finding.

62.3 Below is a summary of the results from the CCGA study (GRAIL S-1 Registration Statement) at 97, 5):



Response to Finding No. 62.3

The proposed finding is confusing. Complaint Counsel is unsure what "fact" Respondents are purporting to offer, beyond the fact that a particular chart appeared in Grail's S-1 statement. To the extent that is the only fact Respondents purport to establish, Complaint Counsel does not disagree that the chart above did in fact appear in Grail's S-1 statement.

To the extent Respondents are attempting to offer the multitude of different statements and findings within that chart for their truth, the proposed finding is improper, unreliable, incomplete, and misleading. The proposed finding would be improper because Respondents

have simply pasted in a chart from a Grail S-1 filing that lists a variety of information. This would represent a compound finding rather than a single finding of fact. Moreover, the chart is not the source of the underlying information and fails to provide reference to the specific source of the information. For example, none of the statistics cite to page numbers from a published academic article. Respondents fail to even provide a PX number for the S-1 filing, in violation of the Court's Post-Trial Order (*See* Post-Trial Order at 3).

The proposed finding is also misleading because it purports to provide a summary of the results of the "CCGA study." The chart itself refers only to the "CCGA-2 Sub-study." The CCGA study involved three separate substudies. (*See* CCFF ¶ 6228). [redacted] Respondents' claim that the chart reflects the "results" from the aggregate CCGA study is thus incorrect.

The proposed finding is also misleading to the extent that it suggests that Galleri can provide early detection of 50+ cancers in an asymptomatic population. As of trial, Galleri had been clinically shown to detect only seven types of early-stage cancer in an asymptomatic screening population – a fact conceded by Respondents' own expert. ((Cote Tr. 4000-4001) ("Q. So as of today, Galleri has been clinically shown to detect seven types of stage one through three cancer in an asymptomatic screening population, correct? A. That's correct."); *see generally* CCFF ¶¶ 6206-6394 (Appendix B: Galleri Has Not Been Clinically Shown to Provide Early Detection of More Than 50 Cancers in an Asymptomatic Population)).

Galleri is being developed (1) as a multi-cancer early detection test (2) for use in screening an asymptomatic population. (*See, e.g.*, RPFF ¶ 342 (stating that Galleri "is designed to detect cancer . . . before a patient ever shows symptoms")). The fact that Galleri can detect

signals for certain cancers among individuals who have already been diagnosed with cancer does not support Galleri's ability to detect those cancers in an asymptomatic screening population.

The CCGA study did not involve a real-world population but rather was a case-control study that assessed Galleri's ability to detect cancer signals in individuals who had already been diagnosed with cancer. (*See* CCFF ¶¶ 6238-6241). Grail's Chief Medical Officer, Dr. Ofman, conceded at trial that the CCGA study did not involve the intended use population for Galleri. (Ofman (Grail) Tr. 3294-95). The authors of the CCGA-2 substudy make this point explicitly: "to understand [Galleri's] performance in an asymptomatic screening population will require additional studies" beyond CCGA. (RX3430 at 10 (M.C. Liu, et al., Sensitive and Specific Multi-Cancer Detection and Localization Using Methylation Signatures in Cell-Free DNA, 6 Annals of Oncology 745 (2020)). Respondents state elsewhere in their proposed findings that "for an early cancer screening test, whose target population comprises asymptomatic individuals who do not have a diagnosis of cancer, the clinical study cannot use samples from cancer patients" if it is to represent "valid scientific evidence used to determine the effectiveness of a device." (*See* RPFF ¶¶ 319-320).

Grail also cannot say today how accurate Galleri's predictions will be at localizing cancer in the intended use population. The cancer signal localization numbers reported in CCGA-2 do not indicate the likelihood that a particular Galleri prediction accurately identifies the location of an individual's' cancer because CCGA did not involve an asymptomatic screening population and the study excluded false positives when assessing cancer signal prediction accuracy.

The proposed finding is factually incorrect because the percentages cited do not represent percentages across all instances "when a cancer signal was detected" in the CCGA-2 substudy as Respondents claim. Rather the reported percentages are only for "<u>those with cancer</u> predicted as

having cancer" (*See* RX3430 (Grail) at 009 (M.C. Liu at al., *Sensitive and Specific Multi-cancer Detection and Localization Using Methylation Signatures in Cell-free DNA*, Annals of Oncology (2020) (emphasis added). In other words, the reported percentages exclude false positives – instances in which Galleri returns a positive result to someone who does not have cancer. [redacted] Respondents' use of "imprecise" terminology in the proposed finding is inaccurate, as it erases the false positive issue intrinsic to Galleri's algorithmic cancer prediction feature.

[redacted] Galleri's false positive issue was brought into focus in Grail's PATHFINDER study, which involved asymptomatic patients. Over half the positive results in PATHFINDER with diagnostic resolution were determined to be false positives (55.4%) and 25 percent of participants who received falsely positive results underwent at least one invasive procedure. (RX3041 at 004 (Tomasz M. Beer, Interim Results of PATHFINDER, a Clinical Use Study Using a Methylation-Based Multi-Cancer Early Detection Test, 2021 ASCO Annual Meeting Presentation, June 4, 2021)). [redacted]

[redacted] For the above reasons, the only "fact" supported by the proposed finding is that the pasted chart appeared in Grail's S-1 statement; beyond that, this Court should disregard the proposed finding

> 62.4 In those over age 50, Galleri demonstrated a 66% detection rate of Stage II cancers for which there are no current recommended screenings. (PX0043 (GRAIL) at 98.)

Response to Finding No. 62.4

The proposed finding is unreliable and misleading. The proposed finding is unreliable because it purports to offer a fact, while failing to provide any reliable citation to the actual source of that fact. Respondents offer only a cite to a Grail SEC filing; the SEC filing itself provides no attribution for the proposed fact and cites no scientific study or studies. To the extent that Respondents are referring to the CCGA-2 substudy, the authors of that study reported Galleri's Stage II sensitivity to be 43%. (RX3430 at 009 (M.C. Liu, et al., Sensitive and Specific Multi-Cancer Detection and Localization Using Methylation Signatures in Cell-Free DNA, 6 Annals of Oncology 745 (2020)). (Even that number is not representative of Galleri's performance in an asymptomatic screening population, as explained in Complaint Counsel's Response to RPFF ¶ 62.3, above.)

Complaint Counsel has no idea where the 66% calculation came from. PX0043 provides no details. Grail's CCGA study did include two types of participants in its cancer arm. Over 70 percent of participants in the cancer arm were identified by "clinical presentation." (*See* CCFF ¶¶ 6244-45). The reminder were diagnosed via other screening tests. Galleri's sensitivity was over three times higher in CCGA-3 for cancer participants diagnosed through "clinical presentation" than for cancer participants diagnosed via other screening tests. (*See* RX3409 at 005 (E. A. Klein et al., *Clinical Validation of a Targeted Methylation-Based Multi-Cancer Early*

Detection Test Using an Independent Validation Set, Annals of Oncology (2021) (stating that "overall sensitivity in cancers identified by clinical presentation [63.9% (61.8% - 66.0%)] was higher than that in cancers identified by screening tests [18.0% (15.5% - 20.8%)]")).

The entire point of an MCED test is to identify cancer early in asymptomatic individuals. Galleri, however, performed much worse at identifying cancer in CCGA among precisely these individuals – namely, those who learned of their cancer via screening tests rather than through "clinical presentation." It appears as if the phrase "for which there are no current recommended screenings" is intended to drop this inconvenient cohort from Grail's sensitivity calculation. Complaint Counsel cannot be sure – because, again, no reliable citation is provided to the true source of the statistic referenced – but notes that any citation to statistics from the CCGA study that omits the screening portion of the cancer arm is likely to overstate Galleri's performance even more than would otherwise be the case. [redacted] For the above reasons, this Court should disregard the proposed finding.

> 62.5 Galleri could be integrated directly into the existing healthcare pathways delivered to 40 million patients a year who are already going to a physician for their standard-of-care cancer screening. (PX0043 (GRAIL) at 98.)

Response to Finding No. 62.5

The proposed finding is vague because the terms "existing healthcare pathways" and "standard-of-care cancer screening" are ambiguous and not defined. Additionally, the proposed finding is unsupported because it relies solely on a Grail SEC filing to speculate on whether physicians could integrate Galleri into their existing cancer screening methods. Therefore, this

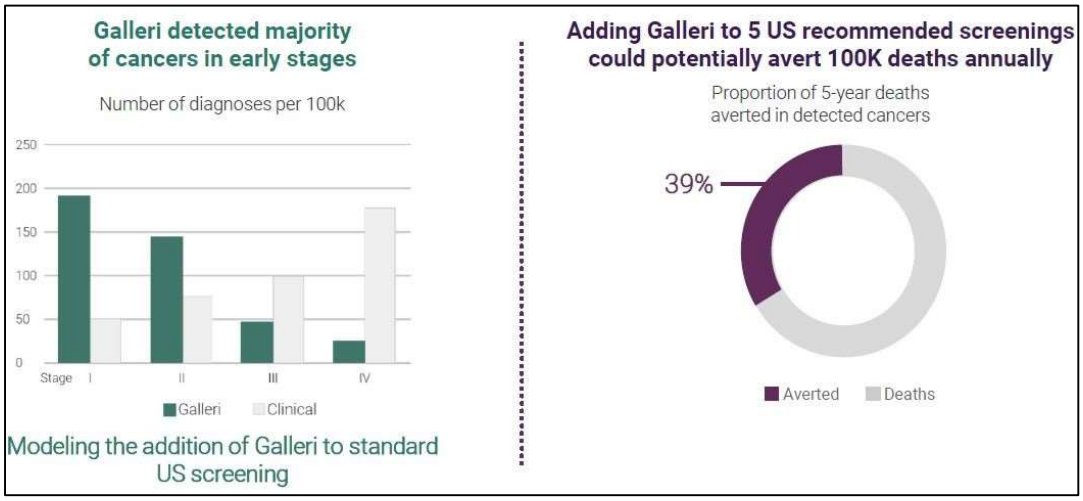
Court should disregard the proposed finding.

63. GRAIL has developed a cancer epidemiology forecast model to estimate the potential impact of multi-cancer early detection testing on cancer stage shift and mortality reduction. (PX0043 (GRAIL) at 6, 98.)

Response to Finding No. 63

The proposed fining is vague because the phrases "cancer epidemiology forecast model" and "stage shift" are undefined.

64. Based on the performance of Galleri in the CCGA-2 study and using 2006 to 2015 SEER data for ages 50–79, GRAIL estimates that by adding Galleri to diagnosis by usual care, there is potential to detect nearly 70% of cancers resulting in death within five years at an earlier stage (excluding cancers that grow too quickly to be detected by any screening program), which would translate to averting potentially 100,000 deaths annually, or 39% of the five-year deaths expected if not for early detection by Galleri. (PX0043 (GRAIL) at 6, 98; [redacted]



Response to Finding No. 64

[redacted]

[redacted]

65. Galleri has the potential to dramatically increase population early cancer detection, reducing the attendant morbidity, mortality and costs of late-stage cancer diagnoses. (PX0043 (GRAIL) at 6, 98; *see also* Ofman (GRAIL) Tr. 3280–81; PX7069 (Bishop (GRAIL) IHT at 24, 204.)

Response to Finding No. 65

The proposed finding is unsupported because it relies solely on Grail's self-serving statements, uncorroborated by any neutral or third-party testimony or evidence. The proposed finding is misleading because the primary underlying source cited, Grail's own S-1 statement, does not state that Grail "has" the potential stated, merely that Grail "*believes*" Grail has the

potential stated. (*See* PX0043 (Grail) at 006, 098 (Grail 2020 Form S-1) ("*We believe* Galleri has the potential to dramatically increase population early cancer detection, reducing the attendant morbidity, mortality and costs of late-stage cancer diagnosis.") (emphasis added)). Complaint Counsel does not disagree that MCED testing broadly is poised to revolutionize how cancer is detected and treated.

66. It has been estimated that a 1% reduction in cancer mortality in the United States would be worth $695 billion in today's dollars from increased quality of life, productivity and survival. (PX0043 (GRAIL) at 6, 98.)

Response to Finding No. 66

Complaint Counsel has no specific response to the proposed finding.

66.1 This estimate does not include intangible benefits such as the decreased emotional burden to family, friends and caregivers. (PX0043 (GRAIL) at 6, 98.)

Response to Finding No. 66.1

Complaint Counsel has no specific response to the proposed finding.

5. **Barriers to Commercial Success**

67. While GRAIL has enormous promise, it must overcome several barriers to achieve success as it shifts its focus from research and development to commercialization. (PX0043 (GRAIL) at 20–69; Bishop (GRAIL) Tr. 1413–14; PX7069 (Bishop (GRAIL) Dep. at 186).)

Response to Finding No. 67

The proposed finding is vague because it refers to a general list of business barriers, which are broadly faced by many companies, instead of identifying any specific barrier to shifting focus from research and development to commercialization. This proposed finding is also vague to the extent that it does not define "success." [redacted]

[redacted] Therefore, this Court should disregard the proposed finding.

68. GRAIL is subject to numerous business and industry risks. For example:

Response to Finding No. 68

The proposed finding is vague because it does not define "numerous." [redacted] Therefore, this Court should disregard the proposed finding.

68.1 GRAIL is operating in a rapidly evolving field and has a limited operating history, which makes it difficult to evaluate GRAIL's current business and predict GRAIL's future performance. (PX0043 (GRAIL) at 11, 20; *see also* Bishop (GRAIL) Tr. 1414.)

Response to Finding No. 68.1

The proposed finding is vague because it does not define "rapidly evolving" or "limited operating history." [redacted]

[redacted]

Therefore, this Court should disregard the proposed finding.

68.2 GRAIL may not be successful in transitioning its products to a new or enhanced version or iteration, since product development involves a lengthy and complex process and GRAIL may be unable to commercialize, validate, or improve performance of any of its products on a timely basis, or at all. (PX0043 (GRAIL) at 11, 20; *see also* Bishop (GRAIL) Tr. 1415.)

Response to Finding No. 68.2

The proposed finding is vague because it does not define "commercialize," "validate," "improve performance," or "timely basis." [redacted] Therefore, this Court should disregard the proposed finding.

68.3 GRAIL has only limited sales and marketing infrastructures and no experience as a company in the sale, marketing, and distribution of screening or diagnostic tests. (PX0043 (GRAIL) at 35; *see also* Bishop (GRAIL) Tr. 1420–21.)

Response to Finding No. 68.3

[redacted]

[redacted]

68.4 Factors that may inhibit GRAIL's efforts to broadly commercialize any of its products include:

- GRAIL's inability to recruit and retain adequate numbers of effective sales, marketing, reimbursement, customer service, medical affairs, and other support personnel;
- the inability of sales personnel to persuade adequate numbers of customers, including healthcare systems and healthcare providers, to use GRAIL's products;
- the inability to price GRAIL's products at a price point sufficient to ensure an adequate and attractive level of profitability;
- GRAIL's inability to effectively market to, collaborate with, and secure coverage and reimbursement from third-party payors;
- GRAIL's failure to comply with applicable regulatory requirements governing the sale, marketing, reimbursement, and commercialization of its products; and
- unforeseen costs and expenses associated with creating an independent commercial organization. (PX0043 (GRAIL) at 35; *see also* Bishop (GRAIL) Tr. 1420–21.)

Response to Finding No. 68.4

The proposed finding is vague because it does not define the terms "efforts to broadly commercialize," "adequate number of effective sales," "adequate number of customers," "adequate and attractive level of profitability," "applicable regulatory requirements," or "independent commercial organization." [redacted]

[redacted]

68.5 GRAIL is at a delicate and risky inflection point as it transitions from a company that up until recently was exclusively an R&D company; GRAIL will need to build different types of teams; serve customers; continue to develop technologies, including screening technologies and other new types of tests. (Bishop (GRAIL) Tr. 1367–68.)

Response to Finding No. 68.5

[redacted]

68.6 GRAIL has incurred significant net losses in each period since GRAIL's inception and anticipate that it will continue to incur net losses for the foreseeable future. (PX0043 (GRAIL) at 11, 20.)

Response to Finding No. 68.6

The proposed finding is vague because it does not define the terms "significant" or "foreseeable future." Therefore, this Court should disregard the proposed finding.

68.7 But for the Transaction, GRAIL may have failed to obtain additional financing and may be unable to expand its commercialization efforts with respect to Galleri and DAC and develop additional products. (PX0043 (GRAIL) at 29; Bishop (GRAIL) Tr. 1372; 1418; Freidin (GRAIL) Tr. 3052–53.)

Response to Finding No. 68.7

The proposed finding is unreliable because it relies upon the self-serving testimony of Grail executives. In addition, the proposed finding is unsupported because no evidence is cited to support the proposition that "but for the Transaction, GRAIL may have failed to obtain additional financing." [redacted] Therefore, this Court should disregard the proposed finding.

68.8 [redacted]

Response to Finding No. 68.8

[redacted]

68.9 Clinical trials are necessary to validate GRAIL's investigational products to launch them as LDTs and to support future product submissions to FDA. (PX0043 (GRAIL) at 11, 22.) The clinical trial process is lengthy and expensive with uncertain outcomes, and often requires the enrollment of large numbers of patients, and suitable patients may be difficult to identify and recruit. (PX0043 (GRAIL) at 11, 22; *see also* Aravanis (Illumina) Tr. 1878–80; PX7130 (Deverka Dep. at 72, 89, 92); *cf.* [redacted]

Response to Finding No. 68.9

[redacted]

[redacted]

68.10 GRAIL has encountered delays and may encounter substantial delays in its clinical studies, including due to COVID-19, and may therefore be unable to complete its clinical studies on the timelines it expects, if at all, which could materially and adversely impact its ability to launch its products and seek regulatory clearance or approval. (PX0043 (GRAIL) at 11, 22; [redacted] PX7104 (Aravanis (Illumina) Dep. at 75–76, 268–69); [redacted]

Response to Finding No. 68.10

[redacted]

68.11 GRAIL is building a new laboratory to ensure capacity to meet future demand and reduce the cost of its test; is investing in robotics and other improvements and will need to obtain regulatory approval for these processes. (Bishop (GRAIL) Tr. 1368–69.)

Response to Finding No. 68.11

The proposed finding is vague and misleading. The proposed finding is vague because the phrase "these processes" is ambiguous and undefined. Complaint Counsel does not disagree that Grail is undertaking the specific activities listed. Grail did not need to obtain regulatory approval to engage in the construction of a new laboratory, however, or to "invest" in robotics or other improvements. To the extent that the prosed finding suggests that Mr. Bishop testified to that effect, the proposed finding is misleading and mischaracterizes his testimony.

68.12 Even if GRAIL commercially launches its products, it may fail to achieve the degree of market acceptance necessary for commercial success. (PX0043 (GRAIL) at 11, 24; PX7066 (Freidin (GRAIL) IHT at 97).)

Response to Finding No. 68.12

The proposed finding is vague because it does not define "commercial success." In addition, the proposed finding is unreliable because it relies on the self-serving testimony of a Grail executive about Grail's ability to "achieve the degree of market acceptance necessary for commercial success." Therefore, this Court should disregard the proposed finding.

68.13 GRAIL has never generated revenue from product sales, does not expect any near-term revenue to offset its ongoing operating expenses, and may never be profitable. (PX0043 (GRAIL) at 11, 25–26; PX7069 (Bishop (GRAIL) IHT at 191); [redacted]

Response to Finding No. 68.13

[redacted]

68.14 GRAIL may be unable to develop and commercialize new products. (PX0043 (GRAIL) at 11, 26–27; *see also* Bishop (GRAIL) Tr. 1414–15.)

Response to Finding No. 68.14

The proposed finding is unreliable because it relies on the self-serving testimony of a Grail executive concerning Grail's ability to develop and commercialize new products. Moreover, this finding should be disregarded as inherently speculative given that there is no evidence cited to explain the basis for this opinion. Therefore, this Court should disregard the proposed finding.

68.15 One of the key elements of GRAIL's strategy is to expand access to GRAIL's tests by pursuing reimbursement and coverage from third-party payors. (PX0043 (GRAIL) at 27; *see also* Bishop (GRAIL) Tr. 1416–17.)

Response to Finding No. 68.15

Complaint Counsel does not disagree with the proposed finding.

68.16 If GRAIL's products do not receive adequate coverage and reimbursement from third-party payors, its ability to expand access to its tests beyond its initial sales channels and its overall commercial success will be limited. (PX0043 (GRAIL) at 27; Bishop (GRAIL) Tr. 1416–18.)

Response to Finding No. 68.16

The proposed finding is vague because it does not define "adequate coverage and reimbursement." In addition, the proposed finding is unreliable because it relies on the self-serving testimony of a Grail executive concerning Grail's overall commercial success. Therefore, this Court should disregard the proposed finding.

68.17 If GRAIL's competitors' products do not perform as intended, the market for GRAIL's products could be impaired. (PX0043 (GRAIL) at 28.)

Response to Finding No. 68.17

The proposed finding is vague because it does not define the terms "perform as intended" or "impaired." Moreover, this document is taken out of context. This document actually explains that if any test marketed or being developed "do not perform to expectations or cause harm or injury to patients" it may lower confidence in early disease detection and post-diagnosis tests in general it does not say how it will impact the MCED market generally. Finally, this proposed finding is misleading to the extent that it implies that Illumina will not have any incentive to foreclose Grail's rivals. Therefore, this Court should disregard the proposed finding.

69. GRAIL is subject to regulation and legal compliance risks. For example:

Response to Finding No. 69

The proposed finding is unsupported because no evidence is cited for the claim that Grail

is subject to regulation and legal compliance risks. Therefore, this Court should disregard the proposed finding.

> 69.1 GRAIL launched Galleri initially as an LDT. (PX0043 (GRAIL) at 41; *see also* Ofman (GRAIL) Tr. 3317, [redacted]; PX7108 (Freidin (GRAIL) Dep. at 96); PX7069 (Bishop (GRAIL) Dep. at 65).)

Response to Finding No. 69.1

Complaint Counsel has no specific response to this proposed finding.

> 69.2 If FDA were to end or modify its current policy of enforcement discretion on LDTs, or if Congress were to enact legislation that changes the current requirements for LDTs, GRAIL may no longer be able to market Galleri without FDA premarket approval, which could result in substantial costs and delays. (PX0043 (GRAIL) at 41; *see also* Ofman (GRAIL) Tr. 3317–20; *cf.* Bishop (GRAIL) Tr. 1323, 1345.)

Response to Finding No. 69.2

The proposed finding is unsupported and vague. First, it relies solely on a Grail SEC filing and the self-serving testimony of Grail's Chief Medical Officer Dr. Joshua Ofman and former CEO Hans Bishop to speculate about potential changes in FDA enforcement policy and Congressional legislation. Second, it does not specify how the FDA could modify its current policy of enforcement discretion or how Congressional legislation could change the current requirements for LDTs. Further, the term "substantial" is ambiguous; it is not clear what constitutes substantial costs and delays. The proposed finding is also vague because "costs and delays" is ambiguous; it is unclear what specifically would be delayed or what "costs" specifically would "result" from potential changes in FDA enforcement policy and Congressional legislation. Therefore, this Court should disregard the proposed finding.

> 69.3 The regulatory clearance or approval processes of FDA and comparable foreign regulatory authorities are lengthy, time-consuming, and unpredictable. (PX0043 (GRAIL) at 43; *see also* Bishop (GRAIL) Tr. 1411); PX7069 (Bishop (GRAIL) IHT at 64–65); PX7048 (Klausner (GRAIL) IHT at 119–20); *cf.* [redacted]

Response to Finding No. 69.3

The proposed finding is vague because the terms "lengthy," "time-consuming," and "unpredictable" are ambiguous. The proposed finding also fails to specify any "comparable foreign regulatory authorities" and so it is unclear to what Respondents are referring. Therefore, this Court should disregard the proposed finding.

> 69.4 If GRAIL is ultimately unable to obtain any necessary or desirable regulatory approvals or clearances, or if such approvals or clearances are significantly delayed, its business will be substantially harmed. (PX0043 (GRAIL) at 43; PX7104 (Aravanis (Illumina) Dep. at 289); [redacted]

Response to Finding No. 69.4

The proposed finding is vague because the terms "significantly" and "substantially" are ambiguous; it is not clear what constitutes significant delays or substantial harm. Additionally, it does not specify which regulatory approvals or clearances could cause such delays nor how Grail's business would be harmed. Therefore, this Court should disregard the proposed finding.

> 69.5 GRAIL's multi-cancer detection tests are a new approach to cancer screening, which present a number of novel and complex issues for FDA review. (PX0043 (GRAIL) at 21, 44; [redacted]) Because FDA has never cleared or approved a multi-cancer detection test, it is difficult to predict what information GRAIL will need to submit to obtain pre-market approval (PMA) from FDA for a proposed intended use, or if GRAIL will be able to obtain such approval on a timely basis or at all. (PX0043 (GRAIL) at 21, 44; [redacted]); PX7065 (Aravanis (Illumina) IHT at 177); Bishop (GRAIL) Tr. 1421.)

Response to Finding No. 69.5

The proposed finding is misleading to the extent that it implies Grail has little to no information about the requirements to obtain PMA from the FDA. [redacted]

[redacted]

The proposed finding is vague because the terms "novel and complex issues" and "timely basis" are ambiguous. Therefore, this Court should disregard the proposed finding.

> 69.6 GRAIL's use and disclosure of personal information, including individually identifiable health information, biologic samples and related data are subject to federal, state and foreign privacy and security regulation. (PX0043 (GRAIL) at 45.) Data privacy rules are evolving and new legislation concerning privacy and data use may limit GRAIL's ability to use such data and specimens. (PX0043 (GRAIL) at 45.) GRAIL's failure to comply with privacy and security requirements or to adequately secure such information could result in significant liability, administrative or governmental penalties, and/or reputational harm and, in turn, substantial harm to its business and results of operations. (PX0043 (GRAIL) at 45.)

Response to Finding No. 69.6

The proposed finding is vague because the terms "significant" and "substantial" are ambiguous; it is not clear what constitutes significant liability or substantial harm. Additionally, the proposed finding is unsupported because it relies solely on a Grail SEC filing to support factual statements related to changes in state, federal, and foreign regulations, legislations, and penalties. Therefore, this Court should disregard the proposed finding.

> 69.7 If GRAIL or its partners fail to comply with federal, state, and foreign laboratory and other applicable licensing and registration requirements, GRAIL could be prevented from performing its tests or experience disruptions to its business. (PX0043 (GRAIL) at 47; Ofman (GRAIL) Tr. 3317–18; PX7092 (Ofman (GRAIL) Dep. at 178–79); PX7069 (Bishop (GRAIL) Dep. at 196); *cf.* PX7104 (Aravanis (Illumina) Dep. at 74–76).)

Response to Finding No. 69.7

The proposed finding is vague to the extent that it does not specify who Grail's "partners" are or how Grail could be prevented from performing its tests or experience disruptions to its business. The proposed finding is also vague because the phrase "federal, state,

and foreign laboratory and other applicable licensing and registration requirements" is broad and ambiguous; it is unclear to which requirements Grail is referring. The proposed finding is also vague because the term "disruptions to its business" is ambiguous and undefined. Additionally, the proposed finding is unsupported because it relies solely on a Grail SEC filing and the testimony of Grail and Illumina executives for statements about the consequences of non-compliance with unspecified federal, state, and foreign licensing and registration requirements. This Court should disregard the proposed finding.

> 69.8 Any product for which GRAIL obtains regulatory clearance or approval will be subject to extensive ongoing regulatory requirements, and GRAIL may be subject to penalties if it or its partners fail to comply with regulatory requirements or if GRAIL experiences unanticipated problems with its products. (PX0043 (GRAIL) at 49.)

Response to Finding No. 69.8

The proposed finding is vague because it does not specify the regulatory clearances or approvals to which it is referring, what ongoing regulatory requirements would entail, and what penalties Grail might suffer if it or its partners fail to comply. It is also not clear who Grail's "partners" are. Additionally, the proposed finding is unsupported because it relies solely on a Grail SEC filing for statements about regulatory approvals, requirements, and penalties. Therefore, this Court should disregard the proposed finding.

> 69.9 To obtain and maintain FDA approvals or clearances, GRAIL's products will need to be manufactured in accordance with federal and state regulations, and it could be forced to recall its devices or terminate production if it or its partners fail to comply with these regulations. (PX0043 (GRAIL) at 50–51.)

Response to Finding No. 69.9

The proposed finding is vague because it is not clear who Grail's "partners" are. Additionally, the proposed finding is unsupported because it relies solely on a Grail SEC filing to speculate on federal and state regulations and penalties. Therefore, this Court should disregard the proposed finding.

69.10 Healthcare reform measures, including recently enacted legislation reforming the U.S. healthcare system, and data protection measures, could significantly harm GRAIL's business, operations and financial condition. (PX0043 (GRAIL) at 51.)

Response to Finding No. 69.10

The proposed finding is vague because the terms "healthcare reform measures," "legislation reforming the U.S. healthcare system," "data protection measures," and "significantly" are ambiguous and overly broad. The proposed finding fails to specify which recently enacted legislation, either at the federal, state, or local level, could harm Grail. Additionally, the proposed finding is unsupported because it relies solely on a Grail SEC filing for statements about healthcare reform and data protection measures. Therefore, this Court should disregard the proposed finding.

C. The Transaction

1. Overview

70. On September 21, 2020, Illumina and GRAIL announced they had entered into a definitive agreement under which Illumina would acquire GRAIL for cash and stock consideration of $8 billion upon closing of the transaction. (PX0122 (Illumina) at 1; RX3349 (GRAIL) at 1; RX3971 (Illumina) at 293; PX0378 (Illumina) at 3–4.)

Response to Finding No. 70

[redacted]

70.1 In addition, GRAIL stockholders were to receive future payments representing a tiered single digit percentage of certain GRAIL-related revenues.

(PX0122 (Illumina) at 1; RX3349 (GRAIL) at 1; RX3971 (Illumina) at 293; PX0378 (Illumina) at 3.)

Response to Finding No. 70.1

[redacted]

70.2 The Boards of Directors of Illumina and GRAIL approved the agreement. (PX0122 (Illumina) at 1; RX3349 (GRAIL) at 1; RX3971 (Illumina) at 293.)

Response to Finding No. 70.2

Complaint Counsel does not disagree with the proposed finding.

71. Under the terms of the agreement, at closing, GRAIL stockholders (including Illumina) were to receive total consideration of $8 billion, consisting of $3.5 billion in cash and $4.5 billion in shares of Illumina common stock, subject to a collar. (PX0122 (Illumina) at 2; RX3349 (GRAIL) at 2; PX0061 (Illumina) at 30.)

Response to Finding No. 71

Complaint Counsel does not disagree with the proposed finding, but notes for accuracy that Illumina closed the transaction in August 2021 (See CCFF ¶¶ 218-226).

71.1 Illumina currently holds 14.5% of GRAIL's shares outstanding, and approximately 12% on a fully diluted basis. (PX0122 (Illumina) at 2; RX3349 (GRAIL) at 3.)

Response to Finding No. 71.1

The proposed finding is incorrect. It states a fact as "currently" accurate but cites to documents dated September 21, 2020. Illumina closed the transaction in August 2021. (See CCFF ¶¶ 218-226). Therefore, this Court should disregard the proposed finding.

71.2 The collar on the stock consideration was to ensure that GRAIL stockholders excluding Illumina would receive a number of Illumina shares equal to approximately $4 billion in value if the 20 trading-day volume weighted average price of

Illumina stock as of 10 trading days prior to closing is between $295 and $399. (PX0122 (Illumina) at 2; RX3349 (GRAIL) at 2; RX3971 (Illumina) at 2, 294.)

Response to Finding No. 71.2

Complaint Counsel does not disagree with the proposed finding, but notes for accuracy that Illumina closed the transaction in August 2021 (See CCFF ¶¶ 218-226).

71.3 GRAIL stockholders excluding Illumina were to receive approximately 9.9 million Illumina shares if the 20 trading-day volume weighted average price of Illumina stock as of 10 trading days prior to closing was above $399 and approximately 13.4 million Illumina shares if the 20 trading-day volume weighted average price of Illumina stock as of 10 trading days prior to closing was below $295. (PX0122 (Illumina) at 2; RX3349 (GRAIL) at 3; RX3971 (Illumina) at 294.)

Response to Finding No. 71.3

Complaint Counsel does not disagree with the proposed finding, but notes for accuracy that Illumina closed the transaction in August 2021 (See CCFF ¶¶ 218-226).

71.4 Upon closing of the transaction, current Illumina stockholders are expected to own approximately 93% of the combined company, while GRAIL stockholders are expected to own approximately 7% based on the mid-point of the collar. (PX0122 (Illumina) at 2; RX3349 (GRAIL) at 3; RX3971 (Illumina) at 294.)

Response to Finding No. 71.4

Complaint Counsel does not disagree with the proposed finding, but notes for accuracy that Illumina closed the transaction in August 2021 (See CCFF ¶¶ 218-226).

72. In connection with the transaction, GRAIL stockholders were also to receive contingent value rights, which would entitle holders to receive future payments representing a pro rata portion of certain GRAIL-related revenues each year for a 12 year period. (PX0122 (Illumina) at 3; RX3349 (GRAIL) at 3; RX3971 (Illumina) at 6; PX0061 (Illumina) at 66.)

Response to Finding No. 72

Complaint Counsel does not disagree with the proposed finding, but notes for accuracy that Illumina closed the transaction in August 2021 (See CCFF ¶¶ 218-226).

72.1 This will reflect a 2.5% payment right to the first $1 billion of revenue each year for 12 years. (PX0061 (Illumina) at 66). Revenue above $1 billion each year would be subject to a 9% contingent payment right during this same period. (PX0122

(Illumina) at 3; RX3349 (GRAIL) at 3; RX3971 (Illumina) at 4, 143, 295; PX0061 (Illumina) at 5, 31, 36, 66.)

Response to Finding No. 72.1

Complaint Counsel does not disagree with the proposed finding, but notes for accuracy that Illumina closed the transaction in August 2021 (See CCFF ¶¶ 218-226).

72.2 Illumina offered GRAIL stockholders the option to receive additional cash and/or stock consideration, in an amount to be determined prior to closing, in lieu of the contingent value rights. (PX0122 (Illumina) at 3; RX3349 (GRAIL) at 3; RX3971 (Illumina) at 2, 295; PX0061 (Illumina) at 36, 66.) Forty percent of shares outstanding have opted for the CVR Consideration. [redacted]

Response to Finding No. 72.2

[redacted]

2. **Strategic Benefits**

73. There are numerous strategic benefits of the transaction, including (1) saving of thousands of lives, (2) acceleration of market access to Galleri, (3) R&D efficiencies, (4) reduction of GRAIL's royalty burden, (5) elimination of double marginalization and (6) supply chain efficiencies, operational efficiencies and acceleration of international expansion of Galleri. (*See* deSouza (Illumina) Tr. 2341–80; Aravanis (Illumina) Tr. 1934–70; Febbo (Illumina) Tr. 4332–72; Qadan (Illumina) Tr. 4158–63; Flatley (Illumina) Tr. 4082–89; Bishop (GRAIL) Tr. 1415–32; Ofman (GRAIL) Tr. 3283–84; 3307–08; 3320–21; [redacted] Freidin (GRAIL) Tr. 2973–74; 2986, 2999, 3007–08.)

Response to Finding No. 73

[redacted]

[redacted]

[redacted]

[redacted]

3. **Consummation of the Deal**

74. On August 18, 2021, Illumina consummated the transaction, but committed to holding GRAIL as a separate company during the European Commission's ongoing regulatory review. (PX0377 (Illumina) at 1; *see also* deSouza (Illumina) Tr. 2234–38.)

Response to Finding No. 74

The proposed finding is misleading and incomplete. First, it does not acknowledge that Illumina's consummation of the transaction violated a standstill order from the European Commission. Illumina acknowledged in an SEC filing that "pursuant to Article 22(4) of the EU Merger Regulation, Illumina was prohibited from implementing the Acquisition (i) until the European Commission clears the Acquisition under the EU Merger Regulation or (ii) until the European Commission refuses the Referral, and therefore the European Commission's acceptance of the Referral continued the purported standstill on the completion of the Acquisition until such time as the European Commission completes its review and approves the Acquisition." (PX0378 at 004 (Illumina Form 8-K, Aug. 18, 2021)). Illumina understood that consummating the transaction during the pendency of the European Commission's review could result in the imposition of "fines, penalties, remedies or restrictions" by regulatory authorities and "other adverse consequences to, among other things, its reputation[.]" (PX0378 at 005 (Illumina Form 8-K, Aug. 18, 2021); *see also* deSouza (Illumina) Tr. 2235-37 (stating that Illumina decided to close the transaction despite the potential fines from the European Commission and the potential risk to its reputation)).

Second, the proposed finding does not acknowledge that despite Illumina's commitments to hold Grail as a separate company, shortly after the consummation Illumina [redacted]

[redacted]. In addition, shortly after Grail's CEO Hans Bishop testified at trial, Illumina announced that Bishop was stepping down as CEO and that Illumina's Chief Operations Officer, Bob Ragusa, would take his place. (PX0405, (Illumina Appoints Ragusa as Chief Executive Officer (CEO) of GRAIL, Oct. 14, 2021, https://www.illumina.com/company/newscenter/ press-releases/press-release-details.html?newsid=2e72344d-ceaf-4453-868a-423516a4ba49 (last visited Oct. 25, 2021)). At Illumina, Ragusa held $1 million in Illumina stock, [redacted] Therefore, this Court should disregard the proposed finding.

75. Regulators in the EU were still reviewing the transaction, but a decision was projected after the deal expires. (PX0377 (Illumina) at 1; *see also* deSouza (Illumina) Tr. 2235–38, 2475–77.)

Response to Finding No. 75

The proposed finding is misleading and incomplete because it does not acknowledge that Illumina's consummation of the transaction violated a standstill order from the European Commission. Illumina acknowledged in an SEC filing that "pursuant to Article 22(4) of the EU Merger Regulation, Illumina was prohibited from implementing the Acquisition (i) until the European Commission clears the Acquisition under the EU Merger Regulation or (ii) until the European Commission refuses the Referral, and therefore the European Commission's acceptance of the Referral continued the purported standstill on the completion of the Acquisition until such time as the European Commission completes its review and approves the Acquisition." (PX0378 at 004 (Illumina Form 8-K, Aug. 18, 2021)). Illumina understood that consummating the transaction during the pendency of the European Commission's review could

result in the imposition of "fines, penalties, remedies or restrictions" by regulatory authorities and "other adverse consequences to, among other things, its reputation[.]" (PX0378 at 005 (Illumina Form 8-K, Aug. 18, 2021); *see also* deSouza (Illumina) Tr. 2235-37 (stating that Illumina decided to close the transaction despite the potential fines from the European Commission and the potential risk to its reputation)). Therefore, this Court should disregard the proposed finding.

76. GRAIL has no business in the EU, and Illumina believes that the European Commission does not have jurisdiction to review the merger as the EU merger thresholds are not met, nor are they met in any EU member state. (PX0377 (Illumina) at 1; *see also* deSouza (Illumina) Tr. 2235–38, 2339–40; PX0378 (Illumina) at 3–4.)

Response to Finding No. 76

The proposed finding is vague and unsupported. It relies solely on an Illumina press release, Illumina SEC filing, and the self-serving testimony of Illumina CEO Francis deSouza to claim that Grail has no business in the EU. The claim that the European Commission does not have jurisdiction to review the merger should be disregarded because it is not a "finding of fact," but rather a legal conclusion in contravention of this Court's order and the Part 3 rules. (*See* 16 C.F.R. § 3.46; Order on Post-Trial Findings). Respondents have merely recited a portion of Illumina's press release. (*See* PX0377 (Illumina Acquires GRAIL to Accelerate Patient Access to Life-Saving Multi-Cancer Early-Detection Test, Aug. 18, 2021)).

The proposed finding is vague because it does not specify which EU merger thresholds are not met. Therefore, this Court should disregard the proposed finding.

76.1 The General Court of the European Union is expected to decide Illumina's jurisdictional challenge some time in 2022. (PX0377 (Illumina) at 1; *see also* deSouza (Illumina) Tr. 2235–38, 2339–40; PX0378 (Illumina) at 4.)

Response to Finding No. 76.1

The proposed finding is vague because the term "some time" is ambiguous. Therefore,

this Court should disregard the proposed finding.

77. There was no legal impediment to Illumina acquiring GRAIL in the US. Illumina believes the reasons to reunite the two companies are compelling:

Response to Finding No. 77

The proposed finding is misleading, incomplete, and unsupported. It is unsupported because no evidence is cited for the claim that there was no legal impediment to Illumina acquiring Grail in the United States.

Additionally, the proposed finding is misleading and incomplete to the extent that it suggests Illumina could acquire Grail without the imposition of fines and penalties or a legal challenge from regulatory authorities. When Illumina consummated the transaction on August 18, 2021, it acknowledged that "Illumina was prohibited from implementing the Acquisition" during the "pendency of the European Commission's review," and that the transaction could result in the imposition of "fines, penalties, remedies or restrictions" by government or regulatory authorities. (PX0378 at 005, 004 (Illumina Form 8-K, Aug. 18, 2021)). Moreover, the FTC could still challenge Illumina and Grail in federal court. The FTC initially challenged the parties in federal court on March 31, 2021, when the FTC filed a Complaint for Preliminary Injunction and Temporary Restraining Order ("PI Complaint") to maintain the *status quo* and prevent Illumina and Grail from consummating the proposed transaction. On May 21, 2021, after the European Commission announced that it was opening an investigation into the proposed transaction, the FTC moved to voluntarily dismiss its PI Complaint without prejudice, understanding that Illumina and Grail would be prohibited from closing under the European Commission's merger regulations. In other words, the FTC's PI Complaint was no longer needed, at that time, to maintain the *status quo* pending administrative trial. (Plaintiff's Ex Parte Application to Dismiss Under Federal Rule of Civil Procedure 41(A)(2), *Federal Trade*

Commission v. Illumina, Inc and Grail, Inc., No. 3:21-cv-00800 (S.D. Cal) (May 21, 2021)). On May 28, 2021, the Court granted the FTC's motion to dismiss its PI Complaint without prejudice, meaning that the FTC could file a Complaint for Preliminary Injunction and Temporary Restraining Order at a later date, if necessary. ((Transcript of Motion Hearing Before the Honorable Cathy Ann Bencivengo, United States District Judge, *Federal Trade Commission v. Illumina, Inc and Grail, Inc.*, No. 3:21-cv-00800 (S.D. Cal) (May 28, 2021)). The FTC could, however, return to federal court if necessary to seek injunctive relief preventing Illumina and GRAIL from integrating their operations during the pendency of the administrative law proceeding in this Court. Therefore, this Court should disregard the proposed finding.

77.1 The deal will save lives. Cancer kills around 10 million people annually worldwide and 600,000 people in the US alone. (PX0377 (Illumina) at 1; *see also* deSouza (Illumina) Tr. 2372.)

Response to Finding No. 77.1

The proposed finding is unsupported and misleading. It relies solely on an Illumina press release and the self-serving testimony of Illumina CEO, Francis deSouza, to assert that the deal will save lives. Additionally, the proposed finding is misleading to the extent that it suggests the deal is necessary to save lives. [redacted] Therefore, this Court should disregard the proposed finding.

77.2 Cancers responsible for nearly 71% of cancer deaths have no recommended early detection screening, and most cancers are detected when chances of survival are lower. (PX0377 (Illumina) at 1; *cf.* Aravanis (Illumina) Tr. 1904.)

Response to Finding No. 77.2

The proposed finding is unsupported because it relies solely on an Illumina press release and the self-serving testimony of Illumina Senior Vice President and Chief Technology Officer,

Dr. Alex Aravanis, to establish statistics on cancer detection and deaths. It is not clear where this data came from or whether or how it was verified. Therefore, this Court should disregard the proposed finding.

> 77.3 Illumina believes there is a moral obligation to have the deal decided by a thoughtful and full review by the EU regulators and the US courts; this can only be done if Illumina acquires GRAIL now. (PX0377 (Illumina) at 1; *see also* deSouza (Illumina) Tr. 2339–40.)

Response to Finding No. 77.3

The proposed finding is vague, misleading, and unsupported. The claim that Illumina's acquisition of Grail is necessary for a full review by EU regulators and the US courts should be disregarded because it is not a "finding of fact," but rather a legal conclusion in contravention of this Court's order and the Part 3 rules. (*See* 16 C.F.R. § 3.46; Order on Post-Trial Findings). Respondents have merely recited a portion of Illumina's press release. (*See* PX0377 (Illumina Acquires GRAIL to Accelerate Patient Access to Life-Saving Multi-Cancer Early-Detection Test, Aug. 18, 2021)).

Furthermore, the proposed finding disregards the fact that Illumina's consummation of the transaction violated a standstill order from the European Commission, thereby interfering with a "thoughtful and full review" by the European Commission, the Federal Trade Commission, and the U.S. courts. Illumina acknowledged in an SEC filing that "pursuant to Article 22(4) of the EU Merger Regulation, Illumina was prohibited from implementing the Acquisition (i) until the European Commission clears the Acquisition under the EU Merger Regulation or (ii) until the European Commission refuses the Referral, and therefore the European Commission's acceptance of the Referral continued the purported standstill on the completion of the Acquisition until such time as the European Commission completes its review and approves the Acquisition." (PX0378 at 004 (Illumina Form 8-K, Aug. 18, 2021)). Illumina

understood that consummating the transaction during the pendency of the European Commission's review could result in the imposition of "fines, penalties, remedies or restrictions" by regulatory authorities and "other adverse consequences to, among other things, its reputation[.]" (PX0378 at 005 (Illumina Form 8-K, Aug. 18, 2021); *see also* deSouza (Illumina) Tr. 2235-37 (stating that Illumina decided to close the transaction despite the potential fines from the European Commission and the potential risk to its reputation)).

Additionally, the proposed finding is vague because the term "moral obligation" is ambiguous. Therefore, this Court should disregard the proposed finding.

> 77.4 Otherwise, the company is locked into a situation where the deal terms will expire before there is a chance for full review; the clock will just run out. (PX0377 (Illumina) at 1; *see also* deSouza (Illumina) Tr. 2475–77.)

Response to Finding No. 77.4

The proposed finding is vague and misleading. It is unclear what "otherwise" refers to, and the terms "situation," "deal terms," and "the clock" are ambiguous.

Additionally, the proposed finding disregards the fact that Illumina's consummation of the transaction violated a standstill order from the European Commission, thereby interfering with the Commission's "full review." Illumina acknowledged in an SEC filing that "pursuant to Article 22(4) of the EU Merger Regulation, Illumina was prohibited from implementing the Acquisition (i) until the European Commission clears the Acquisition under the EU Merger Regulation or (ii) until the European Commission refuses the Referral, and therefore the European Commission's acceptance of the Referral continued the purported standstill on the completion of the Acquisition until such time as the European Commission completes its review and approves the Acquisition." (PX0378 at 004 (Illumina Form 8-K, Aug. 18, 2021)). Illumina understood that consummating the transaction during the pendency of the European Commission's review could result in the imposition of "fines, penalties, remedies or restrictions"

by regulatory authorities and "other adverse consequences to, among other things, its reputation[.]" (PX0378 at 005 (Illumina Form 8-K, Aug. 18, 2021); *see also* deSouza (Illumina) Tr. 2235-37 (stating that Illumina decided to close the transaction despite the potential fines from the European Commission and the potential risk to its reputation)). Therefore, this Court should disregard the proposed finding.

77.5 Right now, the Galleri test is available but costs $950 because it is not covered by insurance. (PX0377 (Illumina) at 1; *see also* deSouza (Illumina) Tr. 2342.)

Response to Finding No. 77.5

The proposed finding is confusing because it claims Galleri costs $950 "because" it is not covered by insurance. The proposed finding is vague because it implies that Galleri would "cost" less if it were covered by insurance, but does not explain for whom the cost would purportedly be lower or why. Therefore, this Court should disregard the proposed finding.

77.6 Reuniting the two companies is the fastest way to make the test broadly available and affordable. (PX0377 (Illumina) at 1; *see also* deSouza (Illumina) Tr. 2341–43.)

Response to Finding No. 77.6

The proposed finding is misleading and unsupported. It relies solely on an Illumina press release and the self-serving testimony of Illumina CEO, Francis deSouza, to assert that reuniting the two companies is the fastest way to make the test broadly available and affordable. Additionally, the proposed finding is misleading to the extent that it suggests the deal is necessary to make Galleri broadly available and affordable. [redacted] Therefore, this Court should disregard the proposed finding.

77.7 Illumina's expertise in market development and access has resulted in coverage of genomic testing for over 1 billion people around the world already. (PX0377 (Illumina) at 2; *see also* deSouza (Illumina) Tr. 2342–43.)

Response to Finding No. 77.7

The proposed finding is vague because the terms "market development and access," "expertise," and "coverage of genomic testing" are ambiguous. The proposed finding is unsupported because it relies solely on an Illumina press release and the self-serving testimony of Illumina CEO, Francis deSouza, to assert that Illumina's purported expertise has resulted in coverage for over 1 billion people. Therefore, this Court should disregard the proposed finding.

77.8 This experience will help lead to coverage and reimbursement for the Galleri test. (PX0377 (Illumina) at 2; *see also* deSouza (Illumina) Tr. 2341–43.)

Response to Finding No. 77.8

The proposed finding is vague and misleading. It is unclear what the term "this experience" refers to. Additionally, the proposed finding is misleading to the extent that it suggests that the deal is necessary for Galleri coverage and reimbursement. [redacted] Therefore, this Court should disregard the proposed finding.

77.9 GRAIL and Illumina have a long history. Illumina formed GRAIL and spun it out in 2016. (PX0377 (Illumina) at 2; *see also* deSouza (Illumina) Tr. 2195–96.)

Response to Finding No. 77.9

The proposed finding is vague because the term "long history" is ambiguous. Otherwise, Complaint Counsel has no specific response to this proposed finding.

77.10 GRAIL's first employees were part of Illumina, which still owns 12 percent of the company. (PX0377 (Illumina) at 2; *see also* Flatley (Illumina) Tr. 4094; [redacted] 152–53, [redacted]).)

Response to Finding No. 77.10

[redacted]

77.11 GRAIL and Illumina are not competitors. (PX0377 (Illumina) at 2; PX7073 (Aravanis (Illumina) IHT at 80).)

Response to Finding No. 77.11

The proposed finding should be disregarded because it is not a "finding of fact," but rather a legal conclusion in contravention of this Court's order and the Part 3 rules. (*See* 16 C.F.R. § 3.46; Order on Post-Trial Findings). Respondents have merely recited a portion of Illumina's press release that is solely supported by the self-serving testimony of Illumina Senior Vice President and Chief Technology Officer, Dr. Alex Aravanis. (*See* PX0377 (Illumina Acquires GRAIL to Accelerate Patient Access to Life-Saving Multi-Cancer Early-Detection Test, Aug. 18, 2021)).

77.12 Based on past experience, when Illumina enters a market, the market expands. (PX0377 (Illumina) at 2; *see also* deSouza (Illumina) Tr. 2392–94.) When Illumina entered the non-invasive prenatal testing space, prices dropped, reimbursement expanded, the number of providers increased, and more expectant parents had access to testing. (PX0377 (Illumina) at 2; *see also* deSouza (Illumina) Tr. 2392–94.)

Response to Finding No. 77.12

[redacted]

[redacted]

[redacted]

77.13 Illumina's acquisition of GRAIL is driven by the belief that Galleri should be available to as many people as possible as quickly as possible. (PX0377 (Illumina) at 2; *see also* deSouza (Illumina) Tr. 2342.) From fighting the COVID-19 pandemic to matching cancer patients to therapies, Illumina's mandate is to save lives and transform healthcare. (PX0377 (Illumina) at 2.)

Response to Finding No. 77.13

The proposed finding is misleading to the extent that it suggests Illumina's acquisition of Grail is necessary for Galleri to be available to as many people as possible as quickly as possible.

[redacted]

The proposed finding is misleading to the extent that it implies Illumina prioritizes "sav[ing] lives and transform[ing] healthcare" over making as much money as possible. Illumina is a public company whose goal is maximizing revenue for its shareholders above all else. [redacted] When acquiring Grail, deSouza told Illumina's investors that the Acquisition will create more value for Illumina's shareholders than simply selling instruments and reagents to Grail. (CCFF ¶ 3094). Accordingly, it only makes business sense for Illumina to "save lives and transform healthcare" if that is a byproduct of increasing its revenues. Therefore, this Court should disregard the proposed finding.

II. BACKGROUND

A. Oncology Overview

1. Cancer and Cancer Stages

78. Cancer affects one in three people in the United States. (RX3035 (ACS) at 1.) As the second leading cause of death in the U.S., behind only heart disease, cancer leads to one in every four deaths in the U.S. (RX3103 (CDC); *see also* Cote Tr. 3728–29.)

Response to Finding No. 78

Complaint Counsel does not disagree with the proposed finding.

79. Cancer has been found in all organs of the human body and is typically named for the part of the body where the cancer originated. (*See* RX3103 (CDC); RX3035 (ACS).)

Response to Finding No. 79

Complaint Counsel does not disagree with the proposed finding.

80. Breast, prostate, lung, and colorectal are the most common cancer types. (RX3103 (CDC).)

Response to Finding No. 80

Complaint Counsel does not disagree with the proposed finding.

81. Cancer is characterized by the development of abnormal cells that divide uncontrollably. (RX3449 (Mayo Clinic) at 2; RX3869 (Cote Expert Report) ¶ 26). Cancers are understood to be caused by accumulated changes or mutations to the DNA inside cells. (RX3449 (Mayo Clinic) at 1–2; RX3869 (Cote Expert Report) ¶ 26.)

Response to Finding No. 81

Complaint Counsel objects to the proposed finding because it improperly cites expert testimony. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

81.1 Often these changes are to genes that control cellular functions, such as those controlling cell growth and division, or DNA repair. (RX3449 (Mayo Clinic) at 1–2.)

Response to Finding No. 81.1

Complaint Counsel has no specific response to the proposed finding.

82. Increasing evidence suggests that cancer may be caused by genomic and epigenomic changes to DNA, including DNA methylation. (RX3401 (Kamel and Bagader Al-Amodi 2016) at 3; Cote Tr. 3733.)

Response to Finding No. 82

Complaint Counsel objects to the proposed finding because it improperly cites expert testimony.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

82.1 Such changes may be inherited from our parents, or may be accumulated as a result of various factors, including from improper DNA repair and from the environment, such as exposure to smoking, radiation, viruses, and carcinogens. (RX3449 (Mayo Clinic) at 2; (RX3506 (National Cancer Institute) at 3; RX3869 (Cote Expert Report) ¶ 26.)

Response to Finding No. 82.1

Complaint Counsel objects to the proposed finding because it improperly cites expert testimony. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

83. DNA stands for deoxyribonucleic acid and is a molecule made up of four chemical bases: adenine, guanine, cytosine and thymine, abbreviated A, G, C and T. Each of these bases are known as "nucleotides"; RNA stands for ribonucleic acid, which comprises uracil, abbreviated U, instead of thymine; together, DNA and RNA are referred to as "nucleic acids." (Cote Tr. 3736; PX7131 (Cote Dep. at 137–138); RX3869 (Cote Expert Report) ¶ 26, n.21.)

Response to Finding No. 83

Complaint Counsel objects to the proposed finding because it improperly cites expert testimony. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote as the only source of evidence supporting the facts in the proposed finding in contravention of this Court's Order. This Court should disregard this evidence, leaving this finding unsupported. Therefore, this Court should disregard the proposed finding.

84. As a result of the genomic and epigenomic changes to the DNA, cancer cells differ from normal cells in that they undergo rapid and uncontrolled growth. (RX3449 (Mayo Clinic) at 2.) Such uncontrolled growth leads to the formation of tumors. (RX3869 (Cote Expert Report) ¶ 27; *see also* RX3449 (Mayo Clinic).)

Response to Finding No. 84

Complaint Counsel objects to the proposed finding because it improperly cites expert testimony. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

85. As these abnormal cells continue to grow and divide, cancer cells may spread (metastasize) to other parts of the body from where the cancer originated. (RX3449 (Mayo Clinic) at 4; RX3869 (Cote Expert Report) ¶ 27.)

Response to Finding No. 85

Complaint Counsel objects to the proposed finding because it is vague, unsupported, and improperly cites expert testimony.

The proposed finding is vague because "these abnormal cells" is not defined.

The proposed finding is unsupported because there is nothing in the cited source (RX3449 at 4) that discusses either cell division and growth or cancer cells spreading.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

86. As cancers progress, the cancer cells can enter the blood stream and the lymphatic system (lymph nodes), in a process called "metastasis". (RX3869 (Cote Expert Report) ¶ 27; RX3506 (National Cancer Institute).)

Response to Finding No. 86

Complaint Counsel objects to the proposed finding because it is incorrect and improperly cites expert testimony.

The proposed finding is incorrect because "metastasis" is actually defined in the cited

source as the "process by which cancer cells spread to other parts of the body," not the mere entry of cancer cells into the blood stream and lymphatic system. (RX3506 (National Cancer Institute) at 14). More specifically, "in metastasis, cancer cells break away from where they first formed (primary cancer), travel through the blood or lymph system, and form new tumors (metastatic tumors) in other parts of the body." (RX3506 (National Cancer Institute) at 14).

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

87. As cancer cells first enter the blood, they are called circulating tumor cells ("CTC"); as these CTC enter other organs and grow, they form metastases, which is the major cause of cancer death. (Cote Tr. 3733; PX7131 (Cote Dep. at 59–61); RX3869 (Cote Expert Report) ¶ 27.)

Response to Finding No. 87

Complaint Counsel objects to the proposed finding because it is incorrect and improperly cites expert testimony. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote as the only source of evidence supporting the facts in the proposed finding in contravention of this Court's Order. This Court should disregard this evidence, leaving this finding unsupported. Therefore, this Court should disregard the proposed finding.

88. The American Joint Committee on Cancer (AJCC) and the Union for International Cancer Control (UICC) maintain the TNM (Tumor, Node, Metastasis) classification system, which characterizes the tumor by size and amount of spread into nearby tissue, its spread into lymph nodes, and metastatic status. (RX3031 (ACS); Cote Tr. 3730–33; RX3869 (Cote Expert Report) ¶ 28, n.25.)

Response to Finding No. 88

Complaint Counsel objects to the proposed finding because it is incorrect and improperly cites expert testimony. This Court ordered that experts shall not be cited to "support factual proposition that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

89. Stages of cancers are determined based on how much cancer there is in a patient's body and where it's located. (RX3031 (ACS) at 1; (Cote Tr. 3730–3732; RX3869 (Cote Expert Report) ¶ 28.) Cancer is commonly divided into five stages:

Response to Finding No. 89

Complaint Counsel objects to the proposed finding because it improperly cites expert testimony. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

89.1 Stage 0 can also refer to a cancer that has not yet invaded into surrounding normal tissue, which is also called carcinoma in *situ*. (Cote Tr. 3730–31; RX3869 (Cote Expert Report) ¶ 28.) Stage 0 can also refer to when a cancer has been treated prior to surgical removal (neoadjuvant therapy) and that cancer can no longer be found. (Cote Tr. 3730–31; RX3869 (Cote Expert Report) ¶ 28, n.26.)

Response to Finding No. 89.1

Complaint Counsel objects to the proposed finding because it improperly cites expert testimony. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote as the only source of evidence supporting the facts in the proposed finding in contravention of this Court's Order. This Court should disregard this evidence, leaving this finding unsupported. Therefore, this Court should disregard the proposed

finding.

89.2 Stage I, which is also called early-stage cancer, means there is cancer present, but it is small and only in one area, where the cancer originated. (Cote Tr. 3731; RX3869 (Cote Expert Report) ¶ 28.)

Response to Finding No. 89.2

Complaint Counsel objects to the proposed finding because it improperly cites expert testimony. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote as the only source of evidence supporting the facts in the proposed finding in contravention of this Court's Order. This Court should disregard this evidence, leaving this finding unsupported. Therefore, this Court should disregard the proposed finding.

89.3 Stage II is still an early stage cancer, but the cancer is larger, and it may also have metastasized to regional lymph nodes. (Cote Tr. 3731; RX3869 (Cote Expert Report) ¶ 28.)

Response to Finding No. 89.3

Complaint Counsel objects to the proposed finding because it improperly cites expert testimony. This Court ordered that experts shall not be cited to "support factual proposition that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only source of evidence supporting the facts in the proposed finding in contravention of this Court's Order. This Court should disregard this evidence, leaving this finding unsupported. Therefore, this Court should disregard the proposed finding.

89.4 Stage III means the cancer is larger, has penetrated more deeply in to the organ of origin, and has spread to lymph nodes. (Cote Tr. 3730–32; RX3869 (Cote Expert Report) ¶ 28.)

Response to Finding No. 89.4

Complaint Counsel objects to the proposed finding because it improperly cites expert testimony. This Court ordered that experts shall not be cited to "support factual proposition that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote as the only source of evidence supporting the facts in the proposed finding in contravention of this Court's Order. This Court should disregard this evidence, leaving this finding unsupported. Therefore, this Court should disregard the proposed finding.

89.5 Stage IV, which is also called advanced or metastatic cancer, means the cancer has spread (metastasized) to other parts of the body. (Cote Tr. 3731; RX3869 (Cote Expert Report) ¶ 28.)

Response to Finding No. 89.5

Complaint Counsel objects to the proposed finding because it improperly cites expert testimony. This Court ordered that experts shall not be cited to "support factual proposition that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only source of evidence supporting the facts in the proposed finding in contravention of this Court's Order. This Court should disregard this evidence, leaving this finding unsupported. Therefore, this Court should disregard the proposed finding.

90. At its earliest stages, particularly Stages 0, I and II, cancer generally does not cause symptoms. (RX3869 (Cote Expert Report) ¶ 29; *see also* Cote Tr. 3730–3732.) By the time symptoms develop, the cancer has very often progressed to Stages III or IV. (RX3869 (Cote Expert Report) ¶ 29; *see also* Cote Tr. 3730–30.)

Response to Finding No. 90

Complaint Counsel objects to the proposed finding because it improperly cites expert testimony. This Court ordered that experts shall not be cited to "support factual proposition that

should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote as the only source of evidence supporting the facts in the proposed finding in contravention of this Court's Order. This Court should disregard this evidence, leaving this finding unsupported. Therefore, this Court should disregard the proposed finding.

91. Cancer staging also helps oncologists determine the best treatment options, such as surgery, radiation, chemotherapy, targeted drug therapy, and immunotherapy, many of which are either invasive, or cause significant harm to normal cells in the body. (RX3031 (American Cancer Society, Cancer Staging) at 1; RX3869 (Cote Expert Report) ¶ 30.)

Response to Finding No. 91

Complaint Counsel objects to the proposed finding because it is unsupported and improperly cites expert testimony.

The proposed finding is unsupported because there is nothing in the cited source (RX3031 at 1) that discusses either cancer treatment options or their effects.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

92. The earlier a cancer can be detected, the higher the cure rate. [redacted]; Cance (ACS) Tr. 600–01, 606–08; PX7086 (Cance (ACS) Dep. at 81, 97) RX3869 (Cote Expert Report) ¶ 31.) Because of this, detecting cancer at earlier stages has been the focus of intense research by the scientific community. [redacted]; Cote Tr. 3719–21; RX3869 (Cote Expert Report) ¶ 31.)

Response to Finding No. 92

Complaint Counsel objects to the proposed finding because it improperly cites expert testimony. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3.

Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

> 92.1 Depending on the type of cancer, patients with Stage 0, I and II cancers can often be cured by surgery alone, or by a combination of surgery and other therapies, such as chemo- or radiation therapy. (Cote Tr. 3731–32; RX3869 (Cote Expert Report) ¶ 31). Stage III cancer has a much lower cure rate. (Cote Tr. 3731–32; RX3869 (Cote Expert Report) ¶ 31).

Response to Finding No. 92.1

Complaint Counsel objects to the proposed finding because it improperly cites expert testimony. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

> 92.2 While Stage IV cancer may be treated (resulting in prolongation of life), it is almost always incurable and will eventually result in the death of the patient. (Cote Tr. 3731; RX3869 (Cote Expert Report) ¶ 31.) Patients diagnosed with Stage IV cancer only account for approximately 18% of total cancer cases, but represent up to 48% of deaths caused by cancer within five years of diagnosis. (RX3178 (Hubbell et al., 2020) at 1.)

Response to Finding No. 92.2

Complaint Counsel objects to the proposed finding because it improperly cites expert testimony. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

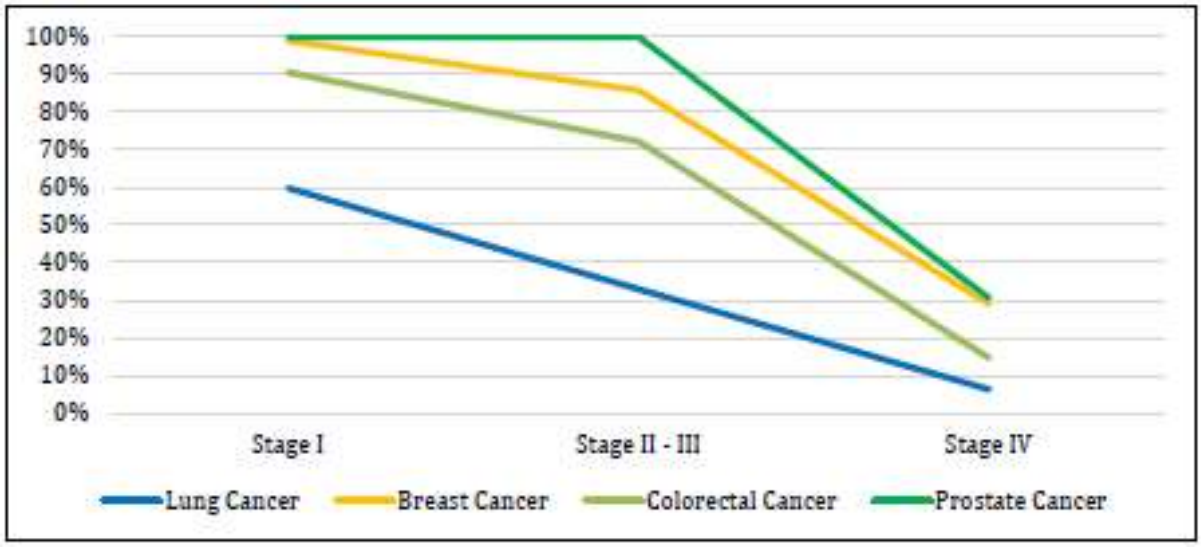
93. Epidemiologically speaking, a cancer patient's survival rates and prognosis correlates to the stage of cancer at the time of the diagnosis. (Cote Tr. 3730–32; RX3869 (Cote Expert Report) ¶ 32.) That is, the earlier the cancer is detected, the higher the likelihood that the patient will recover from cancer, and the longer the patient is likely to survive after the diagnosis. [redacted]; Cance (ACS) Tr. 600–01, 606–08; PX7086 (Cance (ACS) Dep. at 81, 97; Cote Tr. 3730–32; RX3869 (Cote Expert Report) ¶ 32.)

Response to Finding No. 93

Complaint Counsel objects to the proposed finding because it improperly cites expert testimony. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

> 93.1 In breast, colorectal, and prostate cancer, patients diagnosed at Stages I–III have average five-year survival rates between 70% and nearly 100%, while patients with the same types of cancer who are diagnosed at Stage IV experience five-year survival rates of only 14-30%. (RX3504 (SEER) at 4–5; RX3503 (SEER) at 4–5; RX3505 (SEER) at 4–5; RX3869 (Cote Expert Report) ¶ 32.)

Figure 2: Five-Year Survival Correlated With Stage At Diagnosis



(RX3869 (Cote Expert Report) Figure 1.)

Response to Finding No. 93.1

Complaint Counsel objects to the proposed finding because it improperly cites expert testimony. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should

disregard this evidence and the proposed finding.

94. It is well understood that the rate of death for certain cancers, in particular breast, prostate, lung and colon cancer, has declined over the past few decades in the U.S. (RX3033 (ACS) at 2.) This is almost entirely due to earlier detection of these tumor types by routine screening. (RX3869 (Cote Expert Report) ¶ 32; *see also* RX3033 (ACS) at 2.)

Response to Finding No. 94

Complaint Counsel objects to the proposed finding because it improperly cites expert testimony. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

95. For tumors that do not have effective screening technologies, such as pancreas, ovary and stomach cancers (to name a few), the rate of death has been largely unaffected, even in the face of advanced therapies. (PX0125 (ACS) at 4, Figure 1, 20, Table 7; RX3869 (Cote Expert Report) ¶ 32.)

Response to Finding No. 95

Complaint Counsel objects to the proposed finding because it improperly cites expert testimony. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

96. Most types of cancers do not currently have effective *screening* technologies, again highlighting the need for better methods of early detection. [redacted]; Cote Tr. 3728–3729; RX3869 (Cote Expert Report) ¶ 32.)

Response to Finding No. 96

Complaint Counsel objects to the proposed finding because it improperly cites expert testimony. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3.

Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

2. **Biomarkers for Cancer Testing**

97. Currently, many companies and academic groups are researching methods for early cancer screening. [redacted]; Cote Tr. 3719–21; RX3869 (Cote Expert Report) ¶ 33.) Many of these methods detect biomarkers that indicate or suggest the presence of cancer. (Cote Tr. 3733; RX3869 (Cote Expert Report) ¶ 33.)

Response to Finding No. 97

Complaint Counsel objects to the proposed finding because it improperly cites expert testimony. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

98. As a result of the accumulated genomic and/or epigenomic changes in the cancer cells, these cells exhibit uncontrolled cell division and proliferation as well as inhibited apoptosis (cell death). (RX3449 (Mayo Clinic) at 2; PX7131 (Cote Dep. at 60); RX3869 (Cote Expert Report) ¶ 34.)

Response to Finding No. 98

Complaint Counsel objects to the proposed finding because it improperly cites expert testimony. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

99. Such uncontrolled cell division and proliferation result in further genomic and epigenomic changes to the cancer cells. (RX3449 (Mayo Clinic) at 2); PX7131 (Cote Dep. at 59–61); RX3869 (Cote Expert Report) ¶ 34.)

Response to Finding No. 99

Complaint Counsel objects to the proposed finding because it is vague and it improperly

cites expert testimony.

The proposed finding is vague because "such uncontrolled cell division and proliferation" is undefined.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

100. As cancer cells grow and die, they release their contents, including DNA, RNA, proteins and metabolites into the blood and sometimes other body fluids, such as urine, saliva and sputum. (RX3401 (Kamel, Cancer Biomarkers); Cote Tr. 3733; PX7131 (Cote Dep. at 59–61); RX3869 (Cote Expert Report) ¶ 39.)

Response to Finding No. 100

Complaint Counsel objects to the proposed finding because it improperly cites expert testimony. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

101. These released cellular constituents, also called "biomarkers", can be detected by various technologies, and have been the source of intense scientific focus due to their potential to help diagnose cancer earlier, at a more curable stage. (RX3401 (Kamel, Cancer Biomarkers) at 1; Cote Tr. 3733; PX7131 (Cote Dep. at 59–61); RX3869 (Cote Expert Report) ¶ 39.)

Response to Finding No. 101

Complaint Counsel objects to the proposed finding because it is vague, misleading, and it improperly cites expert testimony.

The proposed finding is vague because "these released cellular constituents" is undefined.

The proposed finding is also vague because it does not define "various technologies" and is misleading because it suggests that MCED testing can be accomplished without using Illumina

NGS.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

102. Similarly, exosomes and their constituent components may also be used as a biomarkers for cancer patients. (RX3165 (Dai, Exosomes: Key Players in Cancer and Potential Therapeutic Strategy) at 2; PX7131 (Cote Dep. at 111–12); RX3869 (Cote Expert Report) ¶ 39.)

Response to Finding No. 102

Complaint Counsel objects to the proposed finding because it is vague, misleading, and improperly cites expert testimony.

The proposed finding is vague because it does not define "exosomes" and does not explain what "used as biomarkers for cancer patients" means.

The proposed finding is misleading because it suggests "exosomes and their constituent components" may be used as biomarkers for MCED testing, which is not supported by the source cited (RX3165).

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

103. Many tests in routine use today may be used to detect cancer biomarkers. (RX3869 (Cote Expert Report) ¶ 40). Detection of cancer biomarkers is commonly used to help screen for early stage cancer, for example, detection of Prostate Specific Antigen ("PSA") in the blood for prostate cancer. (Cance (ACS) Tr. 606–07, 622–23; Cote Tr. 3729–30; RX3869 (Cote Expert Report) ¶ 40.)

Response to Finding No. 103

Complaint Counsel objects to the proposed finding because it is vague, misleading, and

improperly cites expert testimony.

The proposed finding is vague because it does not specify or define the purported "many tests in routine use today" and does not define "detect."

The proposed finding is misleading to the extent it suggests that protein biomarkers such as Prostate Specific Antigen are alone sufficient for MCED testing.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

104. Cancer biomarkers are often used for other applications, such as helping determine specific treatments to which a cancer is likely to respond (*i.e.*, cancer therapy selection), by following the course of cancer therapy to see if the therapy is working, and to help detect recurrence of cancer. (Cote Tr. 3733, 3735–36; RX3869 (Cote Expert Report) ¶ 40.)

Response to Finding No. 104

Complaint Counsel objects to the proposed finding because it improperly cites expert testimony. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

105. Cancer biomarkers are most often a very small portion of the DNA, RNA, proteins and metabolites that can be found in the blood and other body fluids. (PX7131 (Cote Dep. at 59–61); RX3869 (Cote Expert Report) ¶ 41.)

Response to Finding No. 105

Complaint Counsel objects to the proposed finding because it is vague and improperly cites expert testimony.

The proposed finding is vague and imprecise because it does not define what "a very

small portion" means.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

106. This is particularly true when cancer is at its earliest, most curable stages, because the total amount of cancer cells in the body at these stages is very small. (PX7131 (Cote Dep. at 59); Cote Tr. 3734–36; RX3869 (Cote Expert Report) ¶ 41.) Thus, detection of biomarkers that indicate the presence of an early stage, potentially curable cancer, has been technically very challenging. (Cote Tr. 3735–36; RX3869 (Cote Expert Report) ¶ 41.)

Response to Finding No. 106

Complaint Counsel objects to the proposed finding because it is vague, misleading, and it improperly cites expert testimony.

The proposed finding is vague because the first subject, "[t]his" is undefined. It is also vague because it does not define "technically very challenging."

[redacted]

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

a. DNA Biomarkers

107. DNA biomarkers, also called *genomic* biomarkers, are among the most common biomarkers for cancer used by researchers and test developers today. (RX3869 (Cote Expert Report) ¶ 42.) DNA biomarkers from cancer cells may be identified in various types of samples from a cancer patient. [redacted]; Cance (ACS) Tr. 609–10; RX3869 (Cote Expert Report) ¶ 42.)

Response to Finding No. 107

[redacted]

107.1 DNA biomarkers may be extracted and evaluated directly from tissue biopsy samples. (RX3869 (Cote Expert Report) ¶ 43). DNA biomarkers may also be found in bodily fluids, such as blood, urine, saliva and sputum samples. (Cance (ACS) Tr. 609–10; RX3869 (Cote Expert Report) ¶ 43).

Response to Finding No. 107.1

Complaint Counsel objects to the proposed finding because it improperly cites expert testimony. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

107.2 DNA biomarkers obtained from blood and other body fluids are known as cell-free DNA ("cfDNA") and more specifically, when detected in the blood, where they are known as circulating tumor DNA ("ctDNA"). (Cance (ACS) Tr. 609; RX3869 (Cote Expert Report) ¶ 43.)

Response to Finding No. 107.2

Complaint Counsel objects to the proposed finding because it is confusing, incorrect, and improperly cites expert testimony.

The proposed finding is confusing because it claims that DNA biomarkers "are known

as" cell-free DNA and "circulating tumor DNA." This is not correct. [redacted]

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

> 107.3 DNA biomarkers may be used to identify both genomic and epigenomic changes that may be relevant for cancer. (Cote Tr. 3733; RX3869 (Cote Expert Report) ¶ 44.) Genomic changes include gene mutations, amplifications, and chromosomal rearrangements. (Cote Tr. 3733; RX3869 (Cote Expert Report) ¶ 44.)

Response to Finding No. 107.3

Complaint Counsel objects to the proposed finding because it is vague and improperly cites expert testimony.

The proposed finding is vague and imprecise because it does not specify or define what "may be relevant for cancer" means.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

> 107.4 Epigenomic changes are those things that occur to specific DNA molecules, or to proteins that regulate DNA function, but are not structural changes in the DNA sequence or copy number, and include histone modifications and DNA methylation. (Cote Tr. 3733; RX3869 (Cote Expert Report) ¶ 45.)

Response to Finding No. 107.4

Complaint Counsel objects to the proposed finding because it is vague and it improperly cites expert testimony.

The proposed finding is vague because it does not define or explain what is meant by "those things."

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

107.5 These epigenomic changes have been of intense interest in the scientific community, and are now believed to be crucial in cancer formation and progression. [redacted]; Cance (ACS) Tr. 612–13; Cote Tr. 3733; RX3869 (Cote Expert Report) ¶ 45.)

Response to Finding No. 107.5

[redacted]

108. Many technologies have been used to detect these genomic and epigenomic changes in cancer DNA biomarkers (including DNA methylation), including polymerase chain reaction ("PCR"), sequencing (such as next-generation sequencing), and microarray, as well as fluorescence *in situ* hybridization ("FISH"). (Cote Tr. 3736–37; RX3869 (Cote Expert Report) ¶ 46.)

Response to Finding No. 108

Complaint Counsel objects to the proposed finding because it is vague, misleading, unsupported, and against the weight of the evidence, Dr. Cote is not qualified to offer opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote is not reliable.

The proposed finding is vague because it does not identify any of the other purported "many technologies" referenced. The proposed finding is also vague because it does not explain or define what "these genomic and epigenomic changes in cancer DNA biomarkers (including DNA methylation)" refers to.

The proposed finding is misleading because it is not specific to MCED testing. The fact that PCR, micorarrays, FISH, or Sanger sequencing have purportedly been used in some limited way "to detect genomic and epigenomic changes in cancer DNA biomarkers" is not evidence that any of these technologies could be used *in the application of multi-cancer early detection*.

The proposed finding is unsupported because, other than the text of this purported fact, which was copied and pasted verbatim from Dr. Cote's report, there is no other information whatsoever in ¶ 46 or anywhere else in Dr. Cote's report even explaining to the Court what FISH is or how it has been used in any type of cancer-related application. The proposed finding is also misleading because there is no evidence in Dr. Cote's report that FISH ever has been or could be used for liquid biopsy-based MCED testing.

[redacted]

[redacted] In addition, Dr. Cote's opinion about which technologies are viable for MCED testing is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight and disregard the proposed finding.

b. RNA Biomarkers

109. RNA biomarkers are another type of biomarker, which are also called *transcriptomic* biomarkers. [redacted]; Cance (ACS) Tr. 609; Cote Tr. 3733; RX3869 (Cote Expert Report) ¶ 47.)

Response to Finding No. 109

Complaint Counsel objects to the proposed finding because it improperly cites expert testimony. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

110. As with DNA biomarkers, RNA biomarkers may also be extracted and evaluated from tissue and liquid biopsy samples. (RX3869 (Cote Expert Report) ¶ 48.) As with ctDNA and cfDNA, bodily fluids may contain circulating cell free RNA ("cfRNA"), which in individuals

with cancer, may contain circulating tumor RNA ("ctRNA"). (Cote Tr. 3733; RX3869 (Cote Expert Report) ¶ 48.)

Response to Finding No. 110

Complaint Counsel objects to the proposed finding because it improperly cites expert testimony. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

111. Often, the genomic and epigenomic changes to the DNA in cancer cells may be reflected in the RNA biomarkers. (Cote Tr. 3733; RX3869 (Cote Expert Report) ¶ 48.)

Response to Finding No. 111

Complaint Counsel objects to the proposed finding because it is vague and improperly cites expert testimony.

The proposed finding is vague because "often" is not specified.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

112. As with DNA biomarkers, many technologies have been used to detect the genomic and epigenomic changes in cancer RNA biomarkers. (Cote Tr. 3736–37; RX3869 (Cote Expert Report) ¶ 49).

Response to Finding No. 112

Complaint Counsel objects to the proposed finding because it is vague, misleading, and against the weight of the evidence, Dr. Cote is not qualified to offer opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote is not reliable.

The proposed finding is vague because it does not identify any of the other purported

"many technologies" referenced. The proposed finding is also vague because it does not explain or define what "the genomic and epigenomic changes in cancer RNA biomarkers" refers to.

The proposed finding is misleading because it is not specific to MCED testing. The fact that "many technologies" have purportedly been used in some limited way "to detect genomic and epigenomic changes in cancer RNA biomarkers" is not evidence that any of these (unidentified) technologies could be used in the application of multi-cancer early detection.

[redacted] In addition, Dr. Cote's opinion about which technologies are viable for MCED testing is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community.

This Court should not accord Dr. Cote's opinion any weight and disregard the proposed finding.

113. Such changes in RNA biomarkers may be detected directly using microarray, RNA *in situ* hybridization ("RNA ISH") and circulating cancer cell RNA imaging. (Cote Tr. 3736–3737; RX3869 (Cote Expert Report) ¶ 49).

Response to Finding No. 113

Complaint Counsel objects to the proposed finding because it is vague, misleading, unsupported, against the weight of the evidence, and improperly cites expert testimony. Dr. Cote is not qualified to offer opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote is not reliable.

The proposed finding is vague because it does not specify what "such changes" refers to.

The proposed finding is misleading because it is not specific to MCED testing. The fact that micorarrays, RNA ISH, or circulating cancer cell RNA imaging have purportedly been used in some limited way "to detect such changes in RNA biomarkers" is not evidence that any of these technologies could be used *in the application of multi-cancer early detection*.

The proposed finding is unsupported because, other than the text of this purported fact, which was copied and pasted verbatim from Dr. Cote's report, there is no other information whatsoever in ¶ 46 or anywhere else in Dr. Cote's report even explaining to the Court what RNA ISH or circulating cancer cell RNA imaging are or how either has been used in any type of cancer-related application. The proposed finding is also misleading because there is no evidence in Dr. Cote's report that either RNA ISH or circulating cancer cell RNA imaging ever has been or could be used for liquid biopsy-based MCED testing.

[redacted]

This Court ordered that experts shall not be cited to "support factual propositions that

should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

[redacted] In addition, Dr. Cote's opinion about which technologies are viable for MCED testing is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

114. Alternatively, messenger RNAs ("mRNAs") may be first reverse-transcribed into complementary DNA ("cDNA"), and then the genomic and epigenomic changes may be detected using the same methods for DNA biomarkers, such as RT-PCR, and sequencing. (Cote Tr. 3736–37; RX3869 (Cote Expert Report) ¶ 49.)

Response to Finding No. 114

Complaint Counsel objects to the proposed finding because it is vague and improperly cites expert testimony.

The proposed finding is vague because though the finding begins by stating "alternatively," the purported alternative is never specified or explained.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

> 114.1 The epigenomic changes like methylation to DNA and RNA may be directly detected by Oxford Nanopore's nanopore sequencers or indirectly detected by short-read sequencers using a method like bisulfite conversion. (Cote Tr. 3753–54; PX7131 (Cote Dep. at 124–26, 205–06); RX3869 (Cote Expert Report) ¶ 49 n.38.)

Response to Finding No. 114.1

Complaint Counsel objects to the proposed finding because it is misleading, against the weight of the evidence, and it improperly cites expert testimony.

The proposed finding is misleading to the extent it suggests that ONT's sequencing platform is feasible for MCED testing. [redacted]

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

> 114.2 Bisulfite conversion is a process in which potentially methylated DNA is treated with sodium bisulfite, leading to conversion of unmethylated cytosines (C) into uracils (U), while methylated cytosines (both 5–methylcytosine and 5–hydroxymethylcytosine) remain unchanged, thus allowing determination of DNA methylation at the singe nucleotide level. (Cote Tr. 3745; RX3869 (Cote Expert Report) ¶ 49 n.38.)

Response to Finding No. 114.2

Complaint Counsel objects to the proposed finding because it improperly cites expert testimony. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

114.3 Another non-bisulfite method to determine DNA methylation has also been developed. (RX3431 (Liu et al., 2019) at 2–3; RX3869 (Cote Expert Report) ¶ 49, n.38.)

Response to Finding No. 114.3

Complaint Counsel objects to the proposed finding because it is vague and improperly cites expert testimony.

The proposed fact is vague because it does not specify or explain this other "non-bisulfite method."

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

c. Protein Biomarkers

115. Protein biomarkers, also called *proteomic* biomarkers, are also commonly used as cancer biomarkers. (Cance (ACS) Tr. 612–13, 632; Cote Tr. 3736–37; RX3869 (Cote Expert Report) ¶ 51.)

Response to Finding No. 115

Complaint Counsel objects to the proposed finding because it is misleading, against the weight of the evidence, and it improperly cites expert testimony.

The proposed finding is misleading to the extent it suggests that proteomics alone is

sufficient for MCED testing. [redacted]

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

116. Some of the genomic and epigenomic changes to the DNA in cancer cells can be reflected in the protein biomarkers, such as point mutations, truncations, fusions, loss of functions, and in the levels, or presence/absence, of protein biomarkers. (RX3869 (Cote Expert Report) ¶ 52).

Response to Finding No. 116

Complaint Counsel objects to the proposed finding because it improperly cites expert testimony. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

117. Protein biomarkers may be examined in bodily fluids, or at a cell, tissue, organ, system, or the whole-body level. (Cance (ACS) Tr. 632; Cote Tr. 3733; RX3869 (Cote Expert Report) ¶ 52.)

Response to Finding No. 117

Complaint Counsel objects to the proposed finding because it improperly cites expert testimony. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3.

Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

118. The approach of using protein biomarker signatures for cancer early screening is an active area of academic and commercial interest, and studies have already determined that by using combinations of protein biomarkers, early cancer can be detected. (RX3274 (Gorelik et al., 2005) at 3; RX3412 (Kozak et al., 2003) at 1; RX3466 (Mor et al., 2005) at 1; Cote Tr. 3735–37.)

Response to Finding No. 118

Complaint Counsel objects to the proposed finding because it is vague, misleading, against the weight of the evidence, Dr. Cote is not qualified to offer opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote is not reliable.

The proposed finding is vague because it does explain what "active area of academic and commercial interest" means.

The proposed finding is misleading because it is not specific to MCED testing. The Gorelik et al. paper from seventeen years ago (RX3274 (Gorelik et al., 2005) at 1, 4), the nearly twenty-year-old Kozak et al. paper (RX3412 (Kozak et al., 2003) at 1), and the Mor et al. paper from seventeen years ago (RX3466 (Mor et al., 2005) at 1) were all about single cancer detection, not multi-cancer early detection, were all about the same single cancer type (ovarian), and were all mere case-control studies. The proposed finding is also misleading because the cited papers did not establish the detection of early stage cancer in a true screening setting (i.e., in asymptomatic, undiagnosed patients not previously known or suspected of having cancer). These sources simply do not support that protein biomarkers alone can support the application of multi-cancer early detection (or even single-cancer early detection).

[redacted]

[redacted]

The proposed finding is also misleading because—like numerous of Respondents' other proposed findings—it is copied and pasted verbatim from Dr. Cote's report (RX3869 (Cote Report) ¶ 53), even though Respondents do not attribute it to Dr. Cote, and represents only his opinion rather than market realities. [redacted] In addition, Dr. Cote's opinion about which technologies are viable for MCED testing is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight and disregard the proposed finding.

119. Protein biomarkers are often used for following the course of treatment for patients with higher stage cancer, and to detect for recurrence in patients who have been treated for cancer. (Cote Tr. 3735–36; RX3869 (Cote Expert Report) ¶ 53.)

Response to Finding No. 119

Complaint Counsel objects to the proposed finding because it is misleading, against the weight of the evidence, and it improperly cites expert testimony.

The proposed finding is misleading to the extent it suggests that proteomics alone is sufficient for MCED testing. [redacted]

[redacted]

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

d. Metabolite Biomarkers

120. Metabolite biomarkers, also called *metabolomic* biomarkers, are presently used less frequently than DNA, RNA and protein biomarkers. (RX3869 (Cote Expert Report) ¶ 54). Metabolite biomarkers are direct representations of cancer phenotypes and how a cell's metabolic pathways or processes change can have direct implications on whether the cell is cancerous. (RX3869 (Cote Expert Report) ¶ 54.)

Response to Finding No. 120

Complaint Counsel objects to the proposed finding because it is vague and improperly cites expert testimony.

The proposed finding is vague because it does not explain for what purpose metabolomic biomarkers are purportedly "presently used."

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

120.1 Metabolite biomarkers include lipids, carbohydrates, nucleotides, and many other low-molecular-weight chemicals, and can be detected in tissue biopsy samples, body fluids, and even in breath through detection of cancer volatile organic compounds ("VOC") markers. (Cance (ACS) Tr. 609–10, 612–13; PX7131 (Cote Dep. at 112); RX3869 (Cote Expert Report) ¶ 54.)

Response to Finding No. 120.1

Complaint Counsel objects to the proposed finding because it is misleading and

improperly cites expert testimony.

The proposed finding is misleading to the extent it suggests that these purported metabolite biomarker molecules may be used for MCED testing.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

e. Exosome Biomarkers

121. Exosomes are best defined as small (40–100 nm) extracellular vesicles that are released from cells, whose membranes (walls) are composed of the plasma membrane of the cell and contain a variety of cellular components, including DNA, RNA, proteins and metabolites. (RX3184 (Edgar 2016) at 1)

Response to Finding No. 121

Complaint Counsel has no specific response to this proposed finding.

121.1 Because they are abundant, found in virtually all body fluids (including blood) and are representative of the cells from which they are derived, there is increasing interest by the academic and commercial communities in using exosomes as cancer biomarkers. (RX3745 (Wong, et al., 2019) at 2, 5; PX7131 (Cote Dep. at 111–12); RX3869 (Cote Expert Report) ¶ 56.)

Response to Finding No. 121.1

Complaint Counsel objects to the proposed finding because it is vague and improperly cites expert testimony.

The proposed finding is vague because it does not define or explain what is meant by "using exosomes as cancer biomarkers."

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should

disregard this evidence and the proposed finding.

B. Clinical Oncology Tests and Testing Modalities

122. While there are many technologies that may be used for early cancer screening, only a few of them are currently in use in commercial tests today. (Cote Tr. 3728–30, 3736–37; RX3869 (Cote Expert Report) ¶ 57.)

Response to Finding No. 122

Complaint Counsel objects to the proposed finding because it is vague and improperly cites expert testimony.

The proposed finding is vague because it does not identify any of the purported "many technologies" referenced. The proposed finding neither identifies those "technologies that may be used for early cancer screening," nor does it identify which "are currently in use in commercial tests today."

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

1. Types of Clinical Oncology Tests

123. Cancer screening and other tests using blood samples are referred to as "liquid biopsy" tests, even though tests of other body fluids (*e.g.*, urine) can sometimes also be referred to as liquid biopsy. [redacted]; Cance (ACS) Tr. 608–09; [redacted]; RX3869 (Cote Expert Report) ¶ 59.)

Response to Finding No. 123

[redacted]

[redacted]

124. Because of the minimal invasiveness and ease of use of liquid biopsy from a small sample of blood, blood-based clinical oncology tests have become a standard and essential part of oncology management, and there is enormous interest in developing blood-based cancer screening tests. [redacted]; Cance (ACS) Tr. 608–09; [redacted]; RX3869 (Cote Expert Report) ¶ 59.)

Response to Finding No. 124

Complaint Counsel objects to the proposed finding because it improperly cites expert testimony. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

125. Based on intended use and target patient populations, multiple types of clinical oncology tests have been developed to aid in the management of cancer at different stages of the "cancer continuum," including: (1) early cancer screening tests; (2) diagnostic aid to cancer tests; (3) therapy selection tests; (4) treatment response or acquired resistance monitoring tests; (5) minimal residual disease ("MRD") tests; and (6) hereditary risk assessment tests. (Cote Tr. 3735–36; RX3869 (Cote Expert Report) ¶ 60.)

Response to Finding No. 125

Complaint Counsel objects to the proposed finding because it is vague and improperly cites expert testimony.

The proposed finding is vague because "cancer continuum" is undefined.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

a. Early cancer screening tests

126. Early cancer screening tests are used in asymptomatic individuals to detect cancer at the earliest, most treatable stage. (Cote Tr. 3735–36; RX3869 (Cote Expert Report) ¶ 61.) There are several types of tests for detecting single types of cancer at early stage, including imaging (mammography for breast and CT for high risk lung cancer screening), blood (PSA for prostate), or stool (colorectal cancer). (Cance (ACS) Tr. 606–07, 622–23; Cote Tr. 3729–30; RX3869 (Cote Expert Report) ¶ 61.)

Response to Finding No. 126

Complaint Counsel objects to the proposed finding because it is vague and improperly cites expert testimony.

The proposed finding is vague because it does not define "the earliest, most treatable stage."

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

127. Work on the development of cancer screening tests has primarily focused on the interrogation of DNA, RNA, proteins, metabolites or exosomes. (Cance (ACS) Tr. 609–10; RX3869 (Cote Expert Report) ¶ 61.)

Response to Finding No. 127

Complaint Counsel objects to the proposed finding because it is vague, misleading, unsupported, and improperly cites expert testimony.

The proposed finding is vague because "work," "development," and "metabolites" are undefined and unspecified. Further, the subjective qualification "primarily focused" is unsupported.

The proposed finding is misleading to the extent it suggests that MCED tests are being developed that rely solely on proteins, other metabolites, or exosomes.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence.

The proposed finding is also misleading because—like numerous of Respondents' other proposed findings—the entire paragraph is adapted nearly verbatim from Dr. Cote's report and represents only his opinion rather than market realities. Therefore, this Court should disregard the proposed finding.

128. Because blood-based cancer screening tests are designed to detect cancer at early stages, they must be very sensitive in order to detect the small amounts of analytes that small tumors release, though there are potential tradeoffs between sensitivity and specificity in early cancer screening, as well as the importance of detecting the cancer signal of origin. (Cote Tr. 3735–36; RX3869 (Cote Expert Report) ¶ 61.)

Response to Finding No. 128

Complaint Counsel objects to the proposed finding because it improperly cites expert testimony.

The proposed finding is confusing because "as well as the importance of detecting the cancer signal of origin" does not seem to follow the rest of the sentence.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

b. Diagnostic aid to cancer ("DAC") tests

129. Once a cancer is suspected or has been detected, it is sometimes difficult to confirm the cancer and determine the type of cancer. (Cote Tr. 3735–36; RX3869 (Cote Expert Report) ¶ 62.)

Response to Finding No. 129

Complaint Counsel objects to the proposed finding because it is vague and improperly cites expert testimony.

The proposed finding is vague because "sometimes" is unspecified and it does not explain how the cancer has purportedly been detected. It is also unclear what particular testing or diagnostic context the proposed finding is referring to.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

130. DAC tests are used to help confirm the presence of cancer or to better specify the type of cancer in an individual who has cancer. (Cote Tr. 3735–36; RX3869 (Cote Expert Report) ¶ 62.)

Response to Finding No. 130

Complaint Counsel objects to the proposed finding because it is vague and improperly cites expert testimony.

The proposed finding is vague because it is unclear what "to better specify the type of cancer" means.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

c. Therapy selection tests

131. Therapy selection tests examine biomarkers (*e.g.*, known types of somatic mutations, hormone receptor status, oncogene protein expression) in individuals who have

already been diagnosed with cancer to help select the particular anti-cancer therapies to which the patient is most likely to respond. (Cote Tr. 3735–36; RX3869 (Cote Expert Report) ¶ 63.)

Response to Finding No. 131

Complaint Counsel objects to the proposed finding because it is vague and improperly cites expert testimony.

The proposed finding is vague because it is not clear what "known types of somatic mutations" refers to.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

132. Because a patient's cancer has already been diagnosed via tissue biopsy or excision at this stage, therapy selection tests are more likely to rely on tissue biopsy samples as there is a much higher amount of cancer cells and other cancer biomarkers in the cancer tissue than are circulating in the body and available for testing. (Cote Tr. 3735–36; RX3869 (Cote Expert Report) ¶ 63.)

Response to Finding No. 132

Complaint Counsel objects to the proposed finding because it is vague and improperly cites expert testimony.

The proposed finding is vague because "at this stage" is unspecified and "more likely" is unqualified. It is also unclear what context this refers to or why purportedly "a patient's cancer has already been diagnosed" at this stage.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

133. However, there is growing use of blood-based testing for cancer biomarkers to help select therapy in patients diagnosed with cancer. (Cote Tr. 3735–36; RX3869 (Cote Expert Report) ¶ 63.) Particularly in the case of tissue-based cancer biomarker analysis, lower sensitivity testing methods may be used for therapy selection tests than for early cancer screening or diagnostic aid to cancer tests. (Cote Tr. 3735–36; RX3869 (Cote Expert Report) ¶ 63.)

Response to Finding No. 133

Complaint Counsel objects to the proposed finding because it is vague and improperly cites expert testimony.

The proposed finding is vague because though the finding begins by stating "however," the purported alternative is never specified or explained. It is also vague because it does not explain what "growing use" or "the case of tissue-based cancer biomarker analysis" means.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

d. Treatment response or acquired resistance monitoring tests

134. Treatment response or acquired resistance monitoring tests test cancer patients while treatment is ongoing to determine whether the patient has responded to or has acquired resistance to the treatment. (Cote Tr. 3735–36; RX3869 (Cote Expert Report) ¶ 64.)

Response to Finding No. 134

Complaint Counsel objects to the proposed finding because it improperly cites expert testimony. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

135. These tests can include imaging, and increasingly liquid biopsy tests for proteins or circulating tumor cells ("CTC"). (RX3869 (Cote Expert Report) ¶ 64.)

Response to Finding No. 135

Complaint Counsel objects to the proposed finding because it is vague, misleading, and improperly cites expert testimony.

The proposed finding is vague because "these tests" is undefined and unspecified. The proposed finding is misleading to the extent it suggests that MCED tests can rely on detecting circulating tumor cells.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

e. Minimal residual disease ("MRD") tests

136. MRD tests are used to determine whether a patient's cancer has recurred after successful treatment for cancer, *i.e.*, when a patient is in remission without symptoms or signs of disease and only a minimal amount of cancer cells and other cancer biomarkers are circulating in the body available to be tested at this stage. (Cote Tr. 3735–36; RX3869 (Cote Expert Report) ¶ 65).

Response to Finding No. 136

Complaint Counsel objects to the proposed finding because it improperly cites expert testimony. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

137. There are two types of MRD tests, those that are "tumor-informed" and those that are "tumor-naïve": tumor-informed MRD tests may use information about a patient's cancer, *i.e.*, the specific mutations/modifications that were present in the patient's original tumor biopsy, while tumor-naïve MRD tests are capable of detecting the recurrence of cancer without information about a given patient's cancer. (RX3869 (Cote Expert Report) ¶ 65.)

Response to Finding No. 137

Complaint Counsel objects to the proposed finding because it is vague and it improperly cites expert testimony.

The proposed finding is vague in that it states tumor-informed MRD tests "may" use information about a patient's cancer, and it does not define or explain what "information about a patient's cancer" references.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

f. Hereditary risk assessment tests

138. Hereditary risk assessment tests examine healthy individuals' germline (*i.e.*, inherited) mutations/variants in cancer susceptibility genes to assess risks of hereditary cancer, based on personal and family history. (Cote Tr. 3734; RX3869 (Cote Expert Report) ¶ 66.) These tests do not test any cancer that has actually developed in the individual being tested. (Cote Tr. 3734; RX3869 (Cote Expert Report) ¶ 66.)

Response to Finding No. 138

Complaint Counsel objects to the proposed finding because it improperly cites expert testimony. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

139. Because hereditary risk assessment tests are based on DNA collected from any tissue (for example, a mouth swab) or from saliva or blood, they do not have the sensitivity required for early cancer screening. (RX3869 (Cote Expert Report) ¶ 66.)

Response to Finding No. 139

Complaint Counsel objects to the proposed finding because it is confusing and

improperly cites expert testimony.

The proposed finding is confusing in that it says hereditary risk assessment tests "do not have the sensitivity required" for early cancer screening tests; but, as their name implies, hereditary risk assessment tests are not designed to screen for the presence of cancer. Moreover, the fact that the DNA is collected from a mouth swab, saliva, or blood is not the reason these tests may lack the sensitivity to detect the presence of cancer, as the proposed finding implies.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

2. The State of Early Cancer Screening Tests Today

140. The most pressing unmet need in cancer early detection is to identify cancers for which there are no existing recommended screening tests. (PX0043 (GRAIL) at 97, 5; *see also* Ofman (GRAIL) Tr. 3308–09; Aravanis (Illumina) Tr. 1937.)

Response to Finding No. 140

Complaint Counsel objects to the proposed finding because it is inherently speculative. For support, Respondents cite only to a GRAIL company filing that provides no source or basis for this claim and the unfounded, self-serving testimony of Grail and Illumina executives. This evidence is uncorroborated by any ordinary course documents or analysis. Given the inherent unreliability of this evidence as well as lack of foundation or explanation for the executives' base conjecture, this proposed finding of fact should be disregarded.

141. There are no standard of care screening tests for most types of cancer, including some of the major causes of cancer mortality, such as cancers of the pancreas, ovary, stomach, bone marrow, lymph nodes, etc. [redacted]; Cote Tr. 3728–30; RX3869 (Cote Expert Report) ¶ 69.)

Response to Finding No. 141

142. In most of these cases, the cancers are not diagnosed before a patient exhibits symptoms, which generally will not occur until the cancer has progressed to a late and often incurable stage. ; RX3869 (Cote Expert Report) ¶ 69.)

Response to Finding No. 142

143. The United States Preventive Services Task Force ("USPSTF") is an independent panel of experts that makes recommendations about clinical preventive services (such as cancer screening) which influence the coverage and adoption of medical services. (*See* RX3867 (Expert Report) ¶ 39.)

Response to Finding No. 143

Complaint Counsel objects to the proposed finding because it improperly cites expert testimony. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Deverka in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

144. USPSTF recommends screening for four cancer types: breast, cervical, lung and colorectal. (RX3723 (USPSTF) at 2–3, 7; Cote Tr. 3728–29.)

Response to Finding No. 144

Complaint Counsel has no specific response to this proposed finding.

145. Other organizations, such as the American Cancer Society, also recommend screening for prostate cancer. (Cance (ACS) Tr. 606; Cote Tr. 3730; RX3869 (Cote Expert Report) ¶ 67.) Below is an overview of the cancer screening tests that are recommended as the "standard of care":

Response to Finding No. 145

The final sentence of the proposed finding is vague and unsupported, because "standard of care" is not defined and no evidence is provided. Therefore, this Court should disregard the proposed finding.

145.1 Breast Cancer. USPSTF recommends biennial screening via mammography for women ages 50 to 74. (RX3723 (USPSTF, A and B Recommendations) at 2; Cance (ACS) Tr. 606; Cote Tr. 3729–30).

Response to Finding No. 145.1

Complaint Counsel has no specific response to this proposed finding.

145.1.1 A mammogram is an X-ray of the breast, which has the associated risk of having repeated exposure to a small amount of radiation. (RX3104 (CDC).)

Response to Finding No. 145.1.1

Complaint Counsel has no specific response to this proposed finding.

145.1.2 When suspicious results are obtained, the patients will undergo either a needle biopsy or fine needle aspiration ("FNA"), or a more extensive removal of tissue, to rule out a diagnosis of cancer. (RX3869 (Cote Expert Report) ¶ 67.)

Response to Finding No. 145.1.2

This proposed finding is vague and improper expert testimony. It is vague because "suspicious results" is not defined. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only source of evidence regarding various organizations' recommended screening guidelines, in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

145.2 Cervical Cancer. For women ages 21 to 29, USPSTF recommends screening every 3 years with cervical cytology (*i.e.*, a pap test) alone; for women ages 30 to 65, every 3 years with cervical cytology alone, every 5 years with high-risk human papillomavirus (hrHPV) testing alone, or every 5 years with hrHPV testing in combination with cytology (cotesting). (RX3723 (USPSTF, A and B Recommendations) at 3; Cance (ACS) Tr. 606; Cote Tr. 3729–30.)

Response to Finding No. 145.2

Complaint Counsel has no specific response to this proposed finding.

145.2.1 Both pap tests and hrHPV testing are invasive procedures which include gynecological examination of the vagina and the cervix, and collection of cells and mucus from the cervix and the area around it, while samples for hrHPV testing are subsequently analyzed using PCR. (RX3106 (CDC, What Should I Know About Screening?) at 1; Cance (ACS) Tr. 606; Cote Tr. 3729–30; RX3869 (Cote Expert Report) ¶ 67.)

Response to Finding No. 145.2.1

This proposed finding is improper expert testimony. Specifically, the only source cited that references PCR analysis is Dr. Cote's report. In fact, this entire "finding" is copied and pasted verbatim from Dr. Cote's report. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See*

Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only source of evidence in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

145.3 Colorectal Cancer. USPSTF recommends screening for colorectal cancer in all adults aged 50 to 75 years. (RX3723 (USPSTF, A and B Recommendations) at 3; Cance (ACS) Tr. 606; Cote Tr. 3729–30).

Response to Finding No. 145.3

Complaint Counsel has no specific response to this proposed finding.

145.3.1 Recommended stool-based tests include the high-sensitivity guaiac fecal occult blood test ("gFOBT"), fecal immunochemical test ("FIT"), and stool DNA test ("sDNA-FIT"). (RX3730 (USPSTF, Screening for Colorectal Cancer) at 2–3.) Recommended direct visualization tests to screen for colorectal cancer include colonoscopy, CT colonography, and flexible sigmoidoscopy. (RX3730 (USPSTF, Screening for Colorectal Cancer) at 3.)

Response to Finding No. 145.3.1

Complaint Counsel has no specific response to this proposed finding.

145.3.2 Colonoscopy is the gold standard for colorectal cancer screening and need only be done every ten years, but it is invasive and requires bowel preparation, anesthesia or sedation. (Cance (ACS) Tr. 606; Cote Tr. 3729–30.)

Response to Finding No. 145.3.2

Complaint Counsel does not disagree that Dr. Cance testified that colonoscopy is the "gold standard" for colorectal cancer. (Cance (ACS) Tr. 606). However, the rest of this finding is unsupported and improper expert testimony. It is unsupported because the evidence cited does not mention these details about colonoscopy. Further, this Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only source of evidence in contravention of this Court's Order. This Court should disregard this evidence.

145.4 Lung Cancer. Lung cancer represents the most common killer among cancers, but USPSTF recommendations for lung cancer screening are limited to the high-

risk smoking population—adults aged 50 to 80 years who have a 20 pack-a-year smoking history and currently smoke or have quit within the past 15 years. (PX0043 (GRAIL) at 97, 110; *see also* Bishop (GRAIL) Tr. 1392[redacted] RX3723 (USPSTF, A and B Recommendations) at 7; Cance (ACS) Tr. 606; Cote Tr. 3729–30.)

Response to Finding No. 145.4

Complaint Counsel has no specific response to this proposed finding.

145.4.1 This high-risk population accounts for only 33% of all lung cancers, meaning there is no effective screening in place for the vast majority of lung cancer diagnoses. (PX0043 (GRAIL) at 97, 110; *see also* Bishop (GRAIL) Tr. 1392; [redacted]

Response to Finding No. 145.4.1

Complaint Counsel has no specific response to this proposed finding.

145.4.2 USPSTF recommends annual screening for lung cancer with low-dose computed tomography ("LDCT"), which carries non-negligible radiation risk and is expensive. (RX3723 (USPSTF, A and B Recommendations) at 7; RX3107 (CDC, Who Should Be Screened for Lung Cancer?); RX3869 (Cote Expert Report) ¶ 67.)

Response to Finding No. 145.4.2

This proposed finding is vague and improper expert testimony. It is vague because the terms "non-negligible" and "expensive" are not defined. Further, this qualitative statement that LDCT "carries non-negligible radiation risk and is expensive" is not supported by the cited evidence, except for Dr. Cote's report. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only source of evidence in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

145.5 Prostate Cancer. Although not listed by the USPSTF, screening for prostate cancer involves a serum test (most commonly) for serum PSA, digital rectal examination ("DRE"), and when suspicious results are obtained, "sextant" prostate needle biopsies (6 biopsies per side, 12 or more total biopsies) that are now often done under radiographic guidance to determine the most suspicious areas. (RX3034 (American

Cancer Society, Recommendations for Prostate Cancer Early Detection) at 1; Cance (ACS) Tr. 606; Cote Tr. 3729–30.)

Response to Finding No. 145.5

The proposed finding is vague, misleading, and unsupported. It is vague because the term "suspicious" is not defined. It is misleading because this "finding" is copied and pasted verbatim from Dr. Cote's report (RX3869 (Cote Report ¶ 67), even though Respondents do not attribute it to him. This finding is not actually supported by the evidence it does cite, leaving it unsupported. Therefore, this Court should disregard the proposed finding.

145.5.1 A problem with the PSA test is that many factors can affect PSA levels, including non-malignant conditions that affect the prostate, while DRE is uncomfortable, invasive and lacks specificity for cancer. (RX3105 (CDC, What Is Screening for Prostate Cancer?) at 1–2; RX3869 (Cote Expert Report) ¶ 67.)

Response to Finding No. 145.5.1

The proposed finding is vague, misleading, and improper expert testimony. It is vague because "many factors" and "uncomfortable" are not defined. It is misleading because this "finding" is copied and pasted verbatim from Dr. Cote's report. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only source of evidence in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

146. Standard, recommended screening tests nearly all come with major issues in their use, interpretation and follow-up. (Cote Tr. 3813–14; RX3869 (Cote Expert Report) ¶ 68.) The standard of care cancer screening tests and their follow-up to rule out a cancer diagnosis (generally, a surgical procedure) currently recommended by the USPSTF are either invasive, burdensome, or carries potential risks to patients, creating a need for blood-based single cancer screening tests. [redacted]; Cote Tr. 3813–14; RX3869 (Cote Expert Report) ¶ 68.)

Response to Finding No. 146

[redacted]

[redacted]

147. Importantly, nearly all recommended screening tests are often "positive"—that is, signal the possible presence of cancer, in many more cases compared to the times they actually detect cancer, which affects what is known as the "Positive Predictive Value" of such tests. (RX3869 (Cote Expert Report) ¶ 68 *see infra* PFF ¶ 174.)

Response to Finding No. 147

This proposed finding is misleading and improper expert testimony. It is misleading because it is copied and pasted verbatim from Dr. Cote's report. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only source of evidence in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

3. **Modalities Used for Cancer Screening**

148. Several types of technologies are being used for screening tests today or are being studied for screening tests in development. (PX7095 (Hill (Emory) Dep. at 27–28); [redacted]; Cance (ACS) Tr. 612–13.) Scientists and doctors recognize today that it is impossible to speculate which modality for cancer screening will be the most successful. [redacted]; Cance (ACS) Tr. 620; PX7086 (Cance (ACS) Dep. at 102); RX3869 (Cote Expert Report) ¶ 70.)

Response to Finding No. 148

[redacted]

[redacted]

a. Imaging

149. For over half a century, imaging technologies have been the standard of care for early-stage cancer detection and screening in the United States. (RX3869 (Cote Expert Report) ¶ 71.) Over the years, imaging technologies progressed from standard x-rays for mammography and lung to low-energy X-rays, 3–D mammography, ultrasound, MRI (Magnetic Resonance Imaging), CT (Computed Tomography), and PET-CT (Positron Emission Tomography), etc. (RX3869 (Cote Expert Report) ¶ 71.)

Response to Finding No. 149

Complaint Counsel objects to the proposed finding because it is misleading, it improperly cites expert testimony, Dr. Cote is not qualified to offer opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

The proposed finding is misleading to the extent it suggests that MCED testing is feasible using imaging technologies alone.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only source of evidence supporting the facts in the proposed finding in contravention of this Court's Order. This Court should disregard this evidence.

The proposed finding is also misleading because—like numerous of Respondents' other proposed findings—it is copied and pasted verbatim from Dr. Cote's report and represents only

his opinion rather than market realities. [redacted] In addition, Dr. Cote's opinion about which technologies are viable for MCED testing is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight and disregard the proposed finding.

150. Imaging technologies provide direct or indirect views of structures inside the body, which allow doctors to detect, locate and stage a tumor. (RX3869 (Cote Expert Report) ¶ 71.) Imaging technologies thus may be used for cancer screening, diagnosis, and monitoring. (RX3869 (Cote Expert Report) ¶ 71.) Imaging technologies are currently the most commonly used and commercially available technique for cancer screening. (RX3869 (Cote Expert Report) ¶ 71.)

Response to Finding No. 150

This proposed finding is misleading and improper expert testimony. It is misleading because it is copied and pasted verbatim from Dr. Cote's report, and no further evidence is cited. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only source of evidence in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

150.1 For example, both the National Cancer Institute and the American Cancer Society recommend mammograms or MRIs along with mammograms for breast cancer screening, and a low-dose CT scan for lung cancer screening. (RX3502 (National Cancer Institute, Screening Tests) at 2; RX3029 (American Cancer Society, Guidelines for the Early Detection of Cancer) at 1, 3; Cance (ACS) Tr. 606; Cote Tr. 3729–30; RX3869 (Cote Expert Report) ¶ 71.)

Response to Finding No. 150.1

This proposed finding is confusing, misleading, and improper expert testimony. It is confusing because it begins "[f]or example," without providing any context or explanation for how it serves as an example. It is misleading because it is copied and pasted verbatim from Dr. Cote's report. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only source of evidence in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

151. Although traditional imaging screenings are typically focused on screening for cancer in a single organ of the body, PET, CT, and PET-CT may in some circumstances be used for whole-body scanning, with PET-CT being more accurate in detecting cancer and providing fewer equivocal findings than PET alone, CT alone, or separately acquired PET and CT studies in a head-to-head comparison. (RX3624 (Schöder & Gonen 2007) at 9.)

Response to Finding No. 151

Complaint Counsel has no specific response to this proposed finding.

152. However, PET-CT scan is not recommended for routine early cancer screening, because of cost and radiation concerns, as well as the inability of PET-CT scanning to detect very small tumors. (RX3624 (Schöder & Gonen 2007) at 9–10; Cote Tr. 3812–13; RX3869 (Cote Expert Report) ¶ 72.)

Response to Finding No. 152

Complaint Counsel objects to the proposed finding because it is vague, misleading, and against the weight of the evidence, Dr. Cote is not qualified to offer opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

The proposed finding is vague in its use of "not recommended" as it is unclear to whom this is attributed and whether they are merely silent or affirmatively recommend against.

The proposed finding is misleading to the extent it suggests that liquid biopsy *followed by* positive reflex PET-CT scan for cancer localization may not prove an optimal method for MCED

testing. [redacted] The Schöder et al. review paper cited is inapposite because it was assessing whether PET-CT is practical to use as a standalone first-line method of early cancer screening, not as a reflex test given only to patients who first show a positive liquid biopsy. (RX3624 (Schöder & Gonen, 2007) at 1).

The proposed finding is also misleading because—like numerous of Respondents' other proposed findings—it is copied and pasted verbatim from Dr. Cote's report and represents only his opinion rather than market realities. [redacted] In addition, Dr. Cote's opinion about which technologies are viable for MCED testing is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight and should disregard the proposed finding.

> 152.1 Diagnostic PET-CT will necessitate further evaluation of true-positive or false-positive finding and therefore impose downstream costs on the health care system as a whole. (RX3624 (Schöder & Gonen 2007) at 9–10.)

Response to Finding No. 152.1

Complaint Counsel objects to the proposed finding because it is vague, misleading, and against the weight of the evidence.

The proposed finding is vague regarding what is the purpose for or context in which

Diagnostic PET-CT is being employed.

The proposed finding is misleading to the extent it suggests that liquid biopsy *followed by* positive reflex PET-CT scan for cancer localization may not prove an optimal method for MCED testing. [redacted] The Schöder review paper cited is inapposite because it was assessing whether PET-CT is practical to use as a standalone first-line method of early cancer screening, not as a reflex test given only to patients who first show a positive liquid biopsy. (RX3624 (Schöder & Gonen, 2007) at 1). Therefore, this Court should disregard the proposed finding.

152.2 A diagnostic PET-CT exposes an individual to 62 times more radiation than a mammogram and 12 times more than a low-dose computed tomography (LDCT), which is only approved in high-risk smokers. (RX0661 (GRAIL) at 36.)

Response to Finding No. 152.2

Complaint Counsel objects to the proposed finding because it is vague, misleading, and against the weight of the evidence.

The proposed finding is vague regarding what is the purpose for or context in which Diagnostic PET-CT is being employed.

The proposed finding is misleading to the extent it suggests that liquid biopsy *followed by* positive reflex PET-CT scan for cancer localization may not prove an optimal method for MCED testing. [redacted]

[redacted]

Therefore, this Court should disregard the proposed finding.

153. The cost (or reimbursement) for imaging-based cancer screening is relatively low. (RX3869 (Cote Expert Report) ¶ 73.) The national average total reimbursement for breast cancer screening is only about $353 per person screened, taking into consideration follow-up ultrasonography, biopsy and MRI costs. (RX3414 (Kunst et al., 2020) at 2.)

Response to Finding No. 153

The proposed finding is vague, misleading, and improper expert testimony. It is vague because Respondents do not define "relatively low." It is misleading because it is copied and pasted verbatim from Dr. Cote's report, and the first sentence specifically has no evidence cited besides Dr. Cote's report. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only source of evidence in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

154. Similarly, the average annual reimbursement of low-dose CT scan for lung cancer screening under Medicare is about $241 per person screened. (RX3593 (Pyenson et al., 2014) at 2; RX3869 (Cote Expert Report) ¶ 73.)

Response to Finding No. 154

Complaint Counsel has no specific response to this proposed finding.

b. Proteomics

155. Protein biomarkers have also been used for many years for early stage cancer detection and screening. (Cance (ACS) Tr. 606; Cote Tr. 3730; RX3869 (Cote Expert Report) ¶ 74.)

Response to Finding No. 155

This proposed finding is vague, misleading, against the weight of the evidence, unsupported, and improper expert opinion.

It is vague because Respondents do not define "many years."

The proposed finding is misleading to the extent it suggests that proteomics is used to test for more than one type of cancer within a single test, which is not the case and not supported by any of the cited sources.

[redacted]

It is unsupported because the cited testimony from Dr. Cance is completely unrelated to this claim.

Instead, the only cited evidence is Dr. Cote's report. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only

source of evidence in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

> 155.1 Protein biomarkers are commonly analyzed using antibodies that specifically bind to the protein and covalently link with certain modifiers for easy detection. (RX3869 (Cote Expert Report) ¶ 74.)

Response to Finding No. 155.1

This proposed finding is vague, unsupported, and improper expert testimony. It is vague because Respondents do not explain what is meant by "commonly analyzed." It is unsupported because the only evidence cited is Dr. Cote's report. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only source of evidence in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

> 155.2 For example, enzyme or fluorescent dye-linked antibodies specific to cancer biomarkers are also used to detect the presence of such antigens in bodily fluids in technologies called ELISA (enzyme-linked immunosorbent assay) and immunochemistry ("IC"), which are used for both cancer diagnosis and screening. (Cote Tr. 3736–37, 3872; RX3869 (Cote Expert Report) ¶ 74.)

Response to Finding No. 155.2

This proposed finding is misleading and improper expert testimony. It is misleading because it is copied and pasted verbatim from Dr. Cote's report. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only source of evidence in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

156. Proteomics is currently used in a variety of early screening tests for several cancers. (Cance (ACS) Tr. 606; Cote Tr. 3729–30, 3736–37, 3872; RX3869 (Cote Expert Report) ¶ 75.)

Response to Finding No. 156

Complaint Counsel objects to the proposed finding because it is misleading and against the weight of the evidence, Dr. Cote is not qualified to offer opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote is not reliable.

The proposed finding is misleading because it suggests that proteomics is used to test for more than one type of cancer within a single test, which is not the case and not supported by any of the cited sources.

[redacted]

The proposed finding is also misleading because—like numerous of Respondents' other proposed findings—it is copied and pasted verbatim from Dr. Cote's report and represents only his opinion rather than market realities. [redacted] In addition, Dr. Cote's opinion about which technologies are viable for MCED testing is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court

should not accord Dr. Cote's opinion any weight and should disregard the proposed finding.

156.1 For example, a blood-based ELISA test for the level of PSA has been recommended by both the National Cancer Institute and the American Cancer Society for early stage screening of prostate cancer. (RX3502 (National Cancer Institute); RX3029 (ACS) at 4; Cance (ACS) Tr. 606; Cote Tr. 3729–30; RX3869 (Cote Expert Report) ¶ 75.)

Response to Finding No. 156.1

This proposed finding is confusing, unsupported, and improper expert opinion. It is confusing because it begins "[f]or example," without providing any context or explanation for how it serves as an example. It is unsupported because none of the cited evidence supports this claim. In fact, the cited evidence suggests the opposite. The National Cancer Institute website states that "expert groups no longer recommend routine PSA testing for most men." (RX3502 at 3 (National Cancer Institute, Screening Tests)). The American Cancer Society website states that "[r]esearch has not yet proven that the potential benefits of testing [for prostate cancer] outweigh the harms of testing and treatment. We believe that men should not be tested without first learning about what we know and don't know about the risks and possible benefits of testing and treatment." (RX3029 at 3 (American Cancer Society, Guidelines for the Early Detection of Cancer)). The cited testimony from Dr. Cance does not support this statement either.

The only remaining evidence that Respondents rely on for this statement is Dr. Cote's testimony and report. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only source of evidence in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

157. The costs for proteomics tests are fairly low. (RX3869 (Cote Expert Report) ¶ 76.) Quest Diagnostics offers the PSA prostate cancer screening test for $75, while, according to the 2021 Fee Schedule, the Centers for Medicare & Medicaid Services ("CMS") reimburses PSA prostate cancer screening for $19.31. (RX3595 (QuestDirect) at 1; RX3869 (Cote Expert Report) ¶ 76.)

Response to Finding No. 157

The proposed finding is vague, misleading, and improper expert testimony. It is vague because Respondents do not define "fairly low." It is misleading because it is copied and pasted verbatim from Dr. Cote's report. The first sentence specifically has no evidence cited besides Dr. Cote's report. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only source of evidence in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

c. Polymerase Chain Reaction

158. Polymerase Chain Reaction ("PCR") is a DNA amplification method that can be used for many different types of applications, including to detect specific genomic mutations or methylation biomarkers known to be associated with cancer. (Cote Tr. 3736–37; RX3869 (Cote Expert Report) ¶ 77.)

Response to Finding No. 158

The proposed finding is vague, misleading, and against the weight of the evidence, and it improperly cites expert testimony. Dr. Cote is not qualified to offer opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote is not reliable.

The proposed finding is vague because the term "DNA amplification method" is undefined.

The proposed finding is misleading to the extent it suggests that PCR-based detection platforms can be used for MCED testing. [redacted]

The proposed finding is improper because this Court held that experts shall not be cited

to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report and his trial testimony to support this proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 77). And, moreover, the quoted portion of Dr. Cote's report—i.e., the entire proposed finding—does not contain any factual citation at all, as it originally appeared in Dr. Cote's report. (RX3869 (Cote Report) ¶ 77). Respondents improperly rely only on Dr. Cote's expert testimony in contravention of this Court's Order, and therefore this Court should disregard Respondents' proposed finding.

[redacted] In addition, Dr. Cote's opinion about which technologies are viable for MCED testing is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

> 158.1 Using PCR, copies of very small amounts of DNA sequences are exponentially amplified in a series of temperature changes. (RX3869 (Cote Expert Report) ¶ 77.) PCR tests can be used to evaluate all types of samples, including cancer biopsy tissue, urine, stool, saliva or blood plasma. (RX3869 (Cote Expert Report) ¶ 77).

Response to Finding No. 158.1

The proposed finding is vague and improperly cites expert testimony. Dr. Cote is not

qualified to offer opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote is not reliable.

The proposed finding is vague because the terms "small amounts," "exponentially," and "temperature changes" are ambiguous.

The proposed finding is also vague because "very small amounts of DNA sequences are exponentially amplified in a series of temperature changes" is an incomplete description of PCR. PCR involves successive cycles of temperature changes, during which the DNA template molecule is denatured into single strands, short DNA primers anneal to the template flanking the region to amplified, and a DNA polymerase enzyme extends the primers into new complementary strands. (CCFF ¶ 1441.)

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report to support this proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 77). And, moreover, the quoted portion of Dr. Cote's report—i.e., the entire proposed finding—does not contain any factual citation at all, as it originally appeared in Dr. Cote's report. (RX3869 (Cote Report) ¶ 77). Respondents improperly rely only on Dr. Cote's expert testimony in contravention of this Court's Order, and therefore this Court should disregard Respondents' proposed finding.

[redacted]

[redacted] In addition, Dr. Cote's opinion about which technologies are viable for MCED testing is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

> 158.2 PCR can use either DNA, such as cell-free DNA present in the blood plasma, or, through a reverse transcription process that first reverse-transcribes RNA into complementary DNA ("cDNA"), use RNA as templates for the genomic amplification in RT-PCR (real time-PCR). (Cote Tr. 3736–37; RX3869 (Cote Expert Report) ¶ 77.)

Response to Finding No. 158.2

The proposed finding is vague and improperly cites expert testimony. Dr. Cote is not qualified to offer opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote is not reliable.

The proposed finding is vague because it conflates reverse transcription PCR (typically abbreviated as "RT-PCR") and real time PCR, also known as quantitative PCR (typically abbreviated as "qPCR").

The proposed finding is confusing and nonsensical because it states "PCR can … use RNA as templates for the genomic amplification." It is unclear what "the genomic amplification" refers to, but it makes no sense, as RNA does not represent a genomic template (save for the genome of an RNA virus, which is unlikely to be what Respondents are referring to as they struggle to make an apparently elusive point).

The proposed finding is also vague because the terms "reverse transcription process" and "complementary DNA" are undefined.

The proposed finding is improper because this Court held that experts shall not be cited

to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report and his trial testimony to support this proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 77). And, moreover, the quoted portion of Dr. Cote's report—i.e., the entire proposed finding—does not contain any factual citation at all, as it originally appeared in Dr. Cote's report. (RX3869 (Cote Report) ¶ 77). Respondents improperly rely only on Dr. Cote's expert testimony in contravention of this Court's Order, and therefore this Court should disregard Respondents' proposed finding.

[redacted] In addition, Dr. Cote's opinion about which technologies are viable for MCED testing is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

158.3 PCR is highly sensitive and requires only minimal amount of sample for detection and amplification of specific sequences. (RX3869 (Cote Expert Report) ¶ 77.)

Response to Finding No. 158.3

The proposed finding is vague, misleading, and it improperly cites expert testimony. Dr. Cote is not qualified to offer opinion testimony on this subject, Dr. Cote is not credible, and Dr.

Cote is not reliable.

The proposed finding is vague because the terms "highly sensitive" and "minimal amount" are ambiguous. It is also vague because it does not provide any context or details about the application(s) it is referring to.

The proposed finding is misleading to the extent it suggests that PCR-based detection platforms can be used for MCED testing. [redacted] The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report to support this proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 77). And, moreover, the quoted portion of Dr. Cote's report—i.e., the entire proposed finding—does not contain any factual citation at all, as it originally appeared in Dr. Cote's report. (RX3869 (Cote Report) ¶ 77). Respondents improperly rely only on Dr. Cote's expert testimony in contravention of this Court's Order, and therefore this Court should disregard Respondents' proposed finding.

[redacted] In addition,

Dr. Cote's opinion about which technologies are viable for MCED testing is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

159. Since its invention in 1983, many improved PCR techniques have been developed and used in clinical cancer testing. (RX3869 (Cote Expert Report) ¶ 78.) Multiplex PCR allows simultaneous detection of multiple targets in a single test, with a different pair of primers for each target. (RX3686 (Thermo Fisher) at 1–2; RX3869 (Cote Expert Report) ¶ 78.)

Response to Finding No. 159

The proposed finding because it is misleading and improper. Dr. Cote is not qualified to offer opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote is not reliable.

Respondents' citation to RX3686 is misleading to the extent that it suggests the Thermo Fisher Ion AmpliSeq Exome RDY Kit is an example of the use of a PCR-based *detection* platform such as qPCR or dPCR as one of the "modalities used for cancer screening" (i.e., the title of this section of Respondents' findings) ((*see* Response to RPFF ¶ 159.2, below (examining Dr. Cote's misunderstanding of PCR and NGS technology).

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report to support the first sentence of the proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 78). Respondents improperly rely only on Dr. Cote's expert testimony in contravention of this Court's Order, and therefore this Court should disregard the first sentence of Respondents' proposed finding.

[redacted] In addition, Dr. Cote's opinion about which technologies are viable for MCED testing is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight and should disregard the proposed finding.

159.1 Multiplex PCR can generate higher throughput than traditional (single-plex) PCR and obtains more information with less sample. (RX3686 (Thermo Fisher) at 1–2; RX3869 (Cote Expert Report) ¶ 78.)

Response to Finding No. 159.1

The proposed finding because it is vague and misleading. Dr. Cote is not qualified to offer opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote is not reliable.

The proposed finding is vague because the term "traditional (single-plex) PCR" is undefined, and the terms "higher throughput," "more information," and "less sample" are ambiguous.

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is copied and pasted verbatim from Dr. Cote's report and represents only his opinion rather than market realities. (RX3869 (Cote Report) ¶ 78). [redacted]

[redacted] In addition, Dr. Cote's opinion about which technologies are viable for MCED testing is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight and should disregard the proposed finding.

> 159.2 For example, Thermo Fisher's Ion AmpliSeq Exome RDY Kit enables ultrahigh-multiplex PCR exome enrichment of approximately 294,000 primer pairs across 12 primer pools, or about 24,500 primer pairs in each PCR pool, showing the ultrahigh capability of the new PCR technology. (RX3686 (Thermo Fisher) at 2; RX3869 (Cote Expert Report) ¶ 78.)

Response to Finding No. 159.2

Complaint Counsel objects to the proposed finding because it is misleading, incorrect, and against the weight of the evidence, Dr. Cote is not qualified to offer opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote is not reliable.

The proposed finding is misleading and incorrect because it suggests that the Thermo Fisher Ion AmpliSeq Exome RDY Kit is an example of the use of a PCR-based *detection* platform such as qPCR or dPCR as one of the "modalities used for cancer screening" (i.e., the title of this section of Respondents' findings). Respondents and Dr. Cote (on whom they rely for this finding) must not understand the difference between (i) PCR-based *detection* platforms such as qPCR or dPCR and (ii) PCR *amplification* utilized as one step within the NGS library preparation process. The Thermo Fisher Ion AmpliSeq product is an example of the latter. Thermo Fisher's Ion AmpliSeq kits are used in the library preparation step of the overall NGS

workflow, hence the "Seq" incorporated into the product name. (RX3686 (Thermo Fisher) at 1 ("[T]he Ion AmpliSeq Exome RDY Kit allows rapid *sequencing* of key exonic regions of the genome[.]"). Respondents appeared to be attempting in this section of their findings to show the Court which detection platforms *other than NGS* are purportedly suitable for cancer screening. Yet as evidence they point to an NGS-related product. This Court should reject this misguided proposed finding. Moreover, this egregious mistake is another example demonstrating Dr. Cote has no expertise in NGS technology and fundamentally misunderstands the products.

The proposed finding is also misleading because—like numerous of Respondents' other proposed findings—it is copied and pasted verbatim from Dr. Cote's report and represents only his opinion rather than market realities.

In addition, Dr. Cote's opinion about which technologies are viable for MCED testing is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not

accord Dr. Cote's opinion any weight and should disregard the proposed finding.

160. Another category of new PCR technology is digital PCR (dPCR). (Cote Tr. 3872; RX3869 (Cote Expert Report) ¶ 79.)

Response to Finding No. 160

The proposed finding is vague and improperly cites expert testimony. Dr. Cote is not qualified to offer opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote is not reliable.

The proposed finding is vague because the term "digital PCR (dPCR)" is undefined. It is also vague because it does not explain what "new" means in this context.

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report and his trial testimony to support this proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 79). And, moreover, the quoted portion of Dr. Cote's report—i.e., the entire proposed finding—does not contain any factual citation at all, as it originally appeared in Dr. Cote's report. (RX3869 (Cote Report) ¶ 79). Respondents improperly rely only on Dr. Cote's expert testimony in contravention of this Court's Order, and therefore this Court should disregard Respondents' proposed finding.

[redacted] In addition,

Dr. Cote's opinion about which technologies are viable for MCED testing is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

> 160.1 For example, Thermo Fisher's microfluidic digital PCR OpenArray system uses a microscope slide-sized plate with 3,072 through-holes, on a system that can run up to four OpenArray plates simultaneously, allowing for generation of over 12,000 data points in a single run. (RX3692 (Thermo Fisher).)

Response to Finding No. 160.1

The proposed finding is vague, misleading, and against the weight of the evidence. Additionally, Respondents' citation to RX3692 is in contravention of this Court's order that "[w]hen citing to exhibits, the parties shall identify the document by the PX or RX number, followed by the name of the entity that produced the document, and the page number." (Order on Post-Trial Findings at 3). RX3692 is a multi-page document; Respondents fail to provide a citation to any specific page number or page range in contravention of the Court's Order. Thus, the Court should disregard this proposed evidence.

The proposed finding is vague because the terms "microfluidic digital PCR OpenArray system" and "through-holes" are undefined, and the opening phrase "for example" is provided without context.

The proposed finding is misleading to the extent it suggests that PCR-based detection platforms can be used for MCED testing. [redacted] The proposed finding is also

misleading because—like numerous of Respondents' other proposed findings—it is copied and pasted verbatim from Dr. Cote's report and represents only his opinion rather than market realities. (RX3869 (Cote Report) ¶ 79). [redacted] In addition, Dr. Cote's opinion about which technologies are viable for MCED testing is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight and should disregard the proposed finding.

> 160.2 Combinati is developing an Absolute Q Microfluidic Array Partitioning (MAP) dPCR system with 20,000 microchambers, pushing the microfluidic digital PCR technology forward even further. (RX3147 (Combinati) at 3; RX3869 (Cote Expert Report) ¶ 79.)

Response to Finding No. 160.2

The proposed finding misattributes the source of a document and, vague, and misleading. Dr. Cote is not qualified to offer opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote is not reliable.

Complaint Counsel objects to the attribution of RX3147 (which Respondents appear to have captured from Combinati's website) to Combinati as the source of the document, in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3. No discovery was

taken in this matter from Combinati, and the document was not produced by Combinati. The document constitutes hearsay. Given the inherent unreliable nature of this document, it has little to no probative value. (*See* Rule 4.43(b)).

The proposed finding is vague because the terms "Microfluidic Array Partitioning (MAP) dPCR system," "microchambers," and "microfluidic digital PCR technology" are undefined. It is also vague as to what "pushing the microfluidic digital PCR technology forward even further" means.

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is copied and pasted verbatim from Dr. Cote's report and represents only his opinion rather than market realities (RX3869 (Cote Report) ¶ 79). [redacted] In addition, Dr. Cote's opinion about which technologies are viable for MCED testing is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight and should disregard the proposed finding.

161. Because of its high sensitivity, PCR is currently used in a variety of early screening tests for several cancers. (Cote Tr. 3736–3737; RX3869 (Cote Expert Report) ¶ 80.) For example, both the National Cancer Institute and the American Cancer Society recommend a stool-based PCR test for early stage screening of colorectal cancer and human papillomavirus ("HPV") PCR test for early stage screening of cervical cancer. (RX3502 (National Cancer Institute) at 2; RX3029 (ACS) at 1–2; RX3869 (Cote Expert Report) ¶ 80.)

Response to Finding No. 161

Complaint Counsel objects to the proposed finding because it misattributes the source of a document, it is misleading and unsupported, it improperly cites expert testimony, Dr. Cote is not qualified to offer expert opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote is not qualified.

Complaint Counsel objects to the attribution of RX3502 (which Respondents appear to have captured from the ACS website) to ACS as the source of the document (ACS did not produce the document), in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3. The document appears incomplete, and fails to include relevant related material that is linked from the captured pages. Given the inherent unreliable nature of this document, it has little to no probative value. (*See* Rule 4.43(b)).

The proposed finding is misleading because it suggests that PCR is used to screen for multiple cancers in a single test, which is not supported by any of the sources cited.

The proposed finding is also misleading because it relates to tests for a single type of cancer, not the MCED testing at issue in this case.

The proposed finding is unsupported because the source cited (RX3502) does not indicate that the National Cancer Institute and the American Cancer Society recommend a stool-based "PCR test."

The proposed finding is also misleading because the HPV PCR test does not directly test for the presence of cancer as MCED tests do, but rather merely tests for the presence of human papillomavirus (RX3502 at 2)—an *infection* that is known to be *linked* to cervical cancer. This is simply not relevant to the highly sensitive NGS-based ctDNA assays employed for the MCED testing at issue in this case.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote as a source of evidence supporting facts in the proposed finding in contravention of this Court's Order. This Court should disregard this evidence.

The proposed finding is also misleading because—like numerous of Respondents' other proposed findings—it is copied and pasted verbatim from Dr. Cote's report and represents only his opinion rather than market realities. [redacted] In addition, Dr. Cote's opinion about which technologies are viable for MCED testing is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight and disregard the proposed finding.

162. Many PCR-based cancer screening tests have low costs, though some are reimbursed at higher costs. (RX3869 (Cote Expert Report) ¶ 81.) For example, while the maximum cost of Cologuard could be $649, the CMS 2021 Fee Schedule for an HPV PCR test is only $35.09. (RX3306 (Healthline Media) at 2; RX3869 (Cote Expert Report) ¶ 81.)

Response to Finding No. 162

The proposed finding is misleading, against the weight of the evidence, and vague, and it improperly cites expert testimony. Dr. Cote is not qualified to offer opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote is not reliable.

The proposed finding is misleading to the extent it suggests that PCR-based detection

platforms can be used for MCED testing. Cologuard is not an MCED test and not even a liquid biopsy test. [redacted]

The proposed finding is vague because "PCR-based cancer screening tests" is not defined, and it is thus not clear whether this refers to tests that purportedly use PCR-based *detection* platforms such as qPCR or dPCR or to tests that merely incorporate PCR amplification into the workflow but require a different detection technology.

The proposed finding is vague as it is not clear what it means that the maximum cost of Cologuard "could be" $649. It also does not identify the purported "many pcr-based cancer screening tests" referenced or the purported "some" PCR-based cancer screening tests referenced.

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report to support the first sentence of the proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 81). Respondents improperly rely only on Dr. Cote's expert testimony in contravention of this Court's Order, and therefore this Court should disregard Respondents' proposed finding.

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is copied and pasted verbatim from Dr. Cote's report and represents only his opinion rather than market realities. [redacted]

[redacted] In addition, Dr. Cote's opinion about which technologies are viable for MCED testing is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

d. Microarrays

163. A microarray is an orderly arrangement of many individual fragments of probes, such as DNAs, RNAs, or proteins, attached to a solid support called chips. (RX3869 (Cote Expert Report) ¶ 82.)

Response to Finding No. 163

The proposed finding is vague, misleading, against the weight of the evidence, and it improperly cites expert testimony. Dr. Cote is not qualified to offer opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote is not reliable.

The proposed finding is vague because the term "probes" is undefined, and the term "many individual fragments" is ambiguous.

The proposed finding is misleading to the extent it suggests that microarray platforms can be used for MCED testing. [redacted]

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents."

(Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report to support this proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 82). And, moreover, the quoted portion of Dr. Cote's report—i.e., the entire proposed finding—does not contain any factual citation at all, as it originally appeared in Dr. Cote's report. (RX3869 (Cote Report) ¶ 82). Respondents improperly rely only on Dr. Cote's expert testimony in contravention of this Court's Order, and therefore this Court should disregard Respondents' proposed finding.

[redacted] In addition, Dr. Cote's opinion about which technologies are viable for MCED testing is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

> 163.1 Microarray-based genomic tests may be used to detect the presence or absence of specific genomic mutations and/or methylations in a sample, because mutated and/or methylated DNA bind to the probes differently than normal DNA. (Cote Tr. 3736–37; RX3869 (Cote Expert Report) ¶ 82.)

Response to Finding No. 163.1

The proposed finding is vague, misleading, and against the weight of the evidence, and it improperly cites expert testimony. Dr. Cote is not qualified to offer opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote is not reliable.

The proposed finding is vague because "bind to the probes differently" is undefined and not explained. It also does not explain what application it is referring to or what "sample" it is referring to.

The proposed finding is misleading to the extent it suggests that microarray platforms can be used for MCED testing. [redacted]

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report and his trial testimony to support this proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 82). And, moreover, the quoted portion of Dr. Cote's report—i.e., the entire proposed finding—does not contain any factual citation at all, as it originally appeared in Dr. Cote's report. (RX3869 (Cote Report) ¶ 82). Respondents improperly rely only on Dr. Cote's expert testimony in contravention of this Court's Order, and therefore this Court should disregard Respondents' proposed finding.

[redacted] In addition, Dr. Cote's opinion about which technologies are viable for MCED testing is unreliable given that

his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

> 163.2 Researchers, *e.g.*, the Cancer Genome Atlas and the Human Tumor Atlas Network, are continually generating data and improving algorithms to identify new associations that may be incorporated into microarray-based tests. (RX3869 (Cote Expert Report) ¶ 82.)

Response to Finding No. 163.2

The proposed finding is vague and improperly cites expert testimony. Dr. Cote is not qualified to offer opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote is not reliable.

The proposed finding is vague because the terms "new associations" and "may be incorporated" are vague. It also does not identify the purported "microarray-based tests" referenced.

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report and his expert testimony to support this proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 82). And, moreover, the quoted portion of Dr. Cote's report—i.e., the entire proposed finding—does not contain any factual citation at all, as it originally appeared in Dr. Cote's report. (RX3869 (Cote Report) ¶ 82). Rather than citing directly to the Cancer Genome Atlas or the Human Tumor Atlas Network, Respondents improperly rely only on Dr. Cote's expert testimony in contravention of this Court's Order, and therefore this Court should disregard

Respondents' proposed finding.

[redacted] In addition, Dr. Cote's opinion about which technologies are viable for MCED testing is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

164. Microarrays provide a high-throughput platform for simultaneously screening tens of thousands of biomolecular interactions. (RX3869 (Cote Expert Report) ¶ 83; *see also* Cote Tr. 3736–37).

Response to Finding No. 164

The proposed finding is misleading, against the weight of the evidence, and vague, and it improperly cites expert testimony. Dr. Cote is not qualified to offer opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote is not reliable.

The proposed finding is misleading to the extent that is suggests the throughput of microarray platforms is comparable to the high throughput of NGS platforms. Thermo Fisher's Felton explained that while microarray technology "can generate a large number of data points, their throughput is relatively low compared to the highest throughput gene sequencing platforms." (PX7097 (Felton (Thermo Fisher) Dep. at 41)).

The proposed finding is misleading to the extent it suggests that microarray platforms can be used for MCED testing. [redacted]

[redacted]

The proposed finding is vague because the term "biomolecular interactions" is ambiguous and undefined.

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report and his trial testimony to support this proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 83). And, moreover, the quoted portion of Dr. Cote's report—i.e., the entire proposed finding—does not contain any factual citation at all, as it originally appeared in Dr. Cote's report. (RX3869 (Cote Report) ¶ 83). Respondents improperly rely only on Dr. Cote's expert testimony in contravention of this Court's Order, and therefore this Court should disregard Respondents' proposed finding.

[redacted] In addition, Dr. Cote's opinion about which technologies are viable for MCED testing is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's

opinion any weight.

164.1 For example, Thermo Fisher's GeneChip Human Genome U133 Plus 2.0 Array allows for analysis of over 47,000 human genes and transcripts at one time. (RX3682 (Thermo Fisher) at 1; Cote Tr. 3876.)

Response to Finding No. 164.1

The proposed finding is misleading and against the weight of the evidence, and Dr. Cote is not qualified to offer opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote is not reliable.

The proposed finding is misleading to the extent that is suggests the throughput of microarray platforms is comparable to the high throughput of NGS platforms. Thermo Fisher's Felton explained that while microarray technology "can generate a large number of data points, their throughput is relatively low compared to the highest throughput gene sequencing platforms." (PX7097 (Felton (Thermo Fisher) Dep. at 41)).

The proposed finding is misleading to the extent it suggests that microarray platforms can be used for MCED testing. [redacted]

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is copied and pasted verbatim from Dr. Cote's report and represents only his opinion rather than market realities. (RX3869 (Cote Report) ¶ 83). [redacted] In addition, Dr. Cote's opinion about

which technologies are viable for MCED testing is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight and should disregard the proposed finding.

> 164.2 Thermo Fisher's Genome-Wide Human SNP Array 6.0 chip features 1.8 million genetic markers for single nucleotide polymorphisms (SNPs) and copy number variations (CNVs). (RX3684 (Thermo Fisher) at 2.)

Response to Finding No. 164.2

The proposed finding is misleading and against the weight of the evidence. Dr. Cote is not qualified to offer opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote is not reliable.

The proposed finding is misleading to the extent that is suggests the throughput of microarray platforms is comparable to the high throughput of NGS platforms. Thermo Fisher's Felton explained that while microarray technology "can generate a large number of data points, their throughput is relatively low compared to the highest throughput gene sequencing platforms." (PX7097 (Felton (Thermo Fisher) Dep. at 41)).

The proposed finding is misleading to the extent it suggests that microarray platforms can be used for MCED testing. [redacted]

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is copied and pasted verbatim from Dr. Cote's report and represents only his opinion rather than market realities (RX3869 (Cote Report) ¶ 83), even though Respondents do not cite Dr. Cote as the source. [redacted]

[redacted] In addition, Dr. Cote's opinion about which technologies are viable for MCED testing is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight and should disregard the proposed finding.

164.3 Agilent Technologies' SurePrint G3 Human Gene Expression Microarrays allow for analysis of over 56,600 genes and transcripts at one time. (RX3019 (Agilent Technologies).)

Response to Finding No. 164.3

The proposed finding misattributes the source of a document and is misleading. Additionally, Respondents' citation to RX3019 is in contravention of this Court's order that "[w]hen citing to exhibits, the parties shall identify the document by the PX or RX number, followed by the name of the entity that produced the document, and the page number." (Order on Post-Trial Findings at 3). RX3019 is a multi-page document; Respondents fail to provide a citation to any specific page number or page range in contravention of the Court's Order. Thus, the Court should disregard this proposed evidence.

Complaint Counsel objects to the attribution of RX3019 (which Respondents appear to have captured from Agilent's website) to Agilent as the source of the document, in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3. No discovery was taken in this matter from Agilent, and the document was not produced by Agilent. The document constitutes

hearsay. Given the inherent unreliable nature of this document, it has little to no probative value. (*See* Rule 4.43(b)).

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is copied and pasted verbatim from Dr. Cote's report and represents only his opinion rather than market realities. (RX3869 (Cote Report) ¶ 83). [redacted] In addition, Dr. Cote's opinion about which technologies are viable for MCED testing is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight and should disregard the proposed finding.

164.4 Agilent Technologies' Human Genome CGH Microarrays offers up to 1 million probes for genome-wide CNV identification and characterization. (RX3869 (Cote Expert Report) ¶ 83; RX3020 (Agilent Technologies).)

Response to Finding No. 164.4

The proposed finding is vague, it misattributes the source of a document, and it is misleading and against the weight of the evidence. Dr. Cote is not qualified to offer opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote is not reliable.

The proposed finding is vague because the terms "probes" and "CNV identification and characterization" are undefined.

Complaint Counsel objects to the attribution of RX3020 (which Respondents appear to

have captured from Agilent's website) to Agilent as the source of the document, in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3. No discovery was taken in this matter from Agilent, and the document was not produced by Agilent. The document constitutes hearsay. Given the inherent unreliable nature of this document, it has little to no probative value. (*See* Rule 4.43(b)).

The proposed finding is misleading to the extent it suggests that microarray platforms can be used for MCED testing. [redacted]

Respondents' citation to RX3020 is misleading because RX3020 does not mention anything about "up to 1 million probes." Instead, Respondents rely on Dr. Cote's report, from which the entire proposed finding has been copied and pasted verbatim. (RX3869 (Cote Report) ¶ 83). Thus, the proposed finding represents only Dr. Cote's opinion rather than market realities. [redacted] In addition, Dr. Cote's opinion about which technologies are viable for MCED testing is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight and should disregard the proposed finding.

164.5 Agilent Technologies' Human DNA Methylation Microarrays use 60–oligomer probes for 28,500 CpG islands in human, representing 237,227 unique probes for DNA methylation. (RX3018 (Agilent Technologies) at 2; RX3869 (Cote Expert Report) ¶ 83.)

Response to Finding No. 164.5

The proposed finding is vague, it misattributes the source of a document, and it is misleading and against the weight of the evidence. Dr. Cote is not qualified to offer opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote is not reliable.

The proposed finding is vague because the terms "oligomer probes," "CpG islands," and "unique probes" are undefined.

Complaint Counsel objects to the attribution of RX3018 (which Respondents appear to have captured from Agilent's website) to Agilent as the source of the document, in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3. No discovery was taken in this matter from Agilent, and the document was not produced by Agilent. The document constitutes hearsay. Given the inherent unreliable nature of this document, it has little to no probative value. (*See* Rule 4.43(b)).

The proposed finding is misleading to the extent it suggests that microarray platforms can be used for MCED testing. [redacted]

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is copied and pasted verbatim from Dr. Cote's report and represents only his opinion rather than market realities. (RX3869 (Cote Report) ¶ 83). [redacted]

[redacted] In addition, Dr. Cote's opinion about which technologies are viable for MCED testing is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight and should disregard the proposed finding.

e. Next Generation Sequencing

165. Sequencing is the process of determining the order of nucleotides, *i.e.*, the sequence, in genomic materials, such as DNA and RNA. (Cote Expert Report) ¶ 85.) The first generation of sequencing technology was based on the chain termination method developed by Dr. Frederick Sanger in 1975, often known as "Sanger Sequencing". (RX3407 (Kircher et al., 2010) at 2; RX3869 (Cote Expert Report) ¶ 85.)

Response to Finding No. 165

The proposed finding is confusing, misleading, against the weight of the evidence, and it improperly cites expert testimony. Dr. Cote is not qualified to offer opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote is not reliable.

The proposed finding is confusing because it refers to "genomic materials, such as DNA and RNA," but RNA does not represent genomic source material (save for the genome of an RNA virus, which is unlikely to be what Respondents are referring to as they struggle to make an apparently elusive point).

The proposed finding is misleading to the extent it suggests that Sanger sequencing platforms can be used for MCED testing. [redacted]

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report to support the first sentence of the proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 85). Respondents improperly rely only on Dr. Cote's expert testimony in contravention of this Court's Order, and therefore this Court should disregard the first sentence of Respondents' proposed finding.

[redacted] In addition, Dr. Cote's opinion about sequencing technology is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight and should disregard the proposed finding.

> 165.1 Applied Biosystems (ABI, now part of Thermo Fisher) introduced the automated ABI Prism 3700 DNA Analyzer in the 1990s, which allowed parallel sequencing of 96 samples of between 600 and 1,000 nucleotides in length, or a maximum of 100,000 nucleotides per run, and a very low error rate at an average of one error per 10,000–100,000 nucleotides. (RX3869 (Cote Expert Report) ¶ 85, n.75.)

Response to Finding No. 165.1

The proposed finding is misleading and against the weight of the evidence, and it improperly cites expert testimony, and Dr. Cote is not qualified to offer opinion testimony on

this subject, Dr. Cote is not credible, and Dr. Cote is not reliable.

The proposed finding is misleading to the extent it suggests that Sanger sequencing platforms can be used for MCED testing. [redacted]

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from a footnote in Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report to support the proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 85 n. 75). Respondents improperly rely only on Dr. Cote's expert testimony in contravention of this Court's Order, and therefore this Court should disregard Respondents' proposed finding.

[redacted] In addition, Dr. Cote's opinion about sequencing technology is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

165.2 The human genome consists of approximately 3,200,000,000 basepairs (3,200 Mbp (mega-basepairs) or 3.2 Gb (giga-basepairs)) of nucleotides in about 30,000

> to 40,000 genes. (RX3869 (Cote Expert Report) ¶ 85, n.75). Many genes are thousands or tens of thousands of basepairs in length, making whole genome sequencing using Sanger sequencers a difficult task. (RX3407 (Kircher et al., 2010) at 2; RX3869 (Cote Expert Report) ¶ 85, n.75.)

Response to Finding No. 165.2

The proposed finding is vague, misleading, against the weight of the evidence, and improperly cites expert testimony. Dr. Cote is not qualified to offer opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote is not reliable.

The proposed finding is vague because "difficult task" is ambiguous.

The proposed finding is misleading because it discusses "whole genome sequencing," which is an altogether different application than MCED testing.

The proposed finding is misleading to the extent it suggests that Sanger sequencing platforms can be used for MCED testing. [redacted]

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report to support the first sentence of the proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 85). Respondents improperly rely only on Dr. Cote's expert testimony in contravention of this Court's Order, and therefore this Court should disregard the first sentence of Respondents' proposed finding.

[redacted]

[redacted] In addition, Dr. Cote's opinion about sequencing technology is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight and should disregard the proposed finding.

166. Next-generation sequencing, also known as NGS, allows parallel sequencing of millions of small DNA fragments that are combined by software into longer, full-length sequences . (Cote Tr. 3750–51; RX3869 (Cote Expert Report) ¶ 86.) With bisulfite conversion and similar techniques, NGS sequencing can be used not only to detect genomic mutations and fragmentations, but also epigenomic modifications such as methylation. (Cote Tr. 3745; RX3869 (Cote Expert Report) ¶ 86.)

Response to Finding No. 166

The proposed finding is vague, incorrect, confusing, misleading, and against the weight of the evidence, and it improperly cites expert testimony, Dr. Cote is not qualified to offer opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote is not reliable.

The proposed finding is vague because it does not define what "small" DNA fragments means and does not identify the purported "similar techniques." It is also vague because it does not define genomic "fragmentations."

The proposed finding is incorrect and confusing because not all sequencing applications involve combining small fragments "by software into longer, full-length sequences." Applications such as genome assembly involve combining small fragments into larger sequences; whereas applications such as MCED testing may not have such a step.

The proposed finding is misleading to the extent it suggests that non-Illumina NGS

platforms can be used for MCED testing. [redacted]

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from a footnote in Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report and his trial testimony to support the proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 86). Respondents improperly rely only on Dr. Cote's expert testimony in contravention of this Court's Order, and therefore this Court should disregard Respondents' proposed finding.

[redacted] In addition, Dr. Cote's opinion about NGS technology is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

> 166.1 Bisulfite conversion is a process in which potentially methylated DNA is treated with sodium bisulfite, leading to conversion of unmethylated cytosines (C) into uracils (U), while methylated cytosines (both 5–methylcytosine and 5–hydroxymethylcytosine) remain unchanged, thus allowing determination of DNA methylation at the singe nucleotide level. (Cote Tr. 3745; RX3869 (Cote Expert Report) ¶ 86, n.76.)

Response to Finding No. 166.1

Complaint Counsel objects to the proposed finding because it improperly cites expert testimony. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

167. Because cancer is caused by accumulated changes to genes that control cellular functions, a possible approach to cancer screening would be to identify all changes to such genes by interrogating all relevant gene sequences through sequencing. (PX7131 (Cote Dep. at 108–09, 125–27; RX3869 (Cote Expert Report) ¶ 87.)

Response to Finding No. 167

The proposed finding is vague and improperly cites expert testimony. Dr. Cote is not qualified to offer opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote is not reliable.

The proposed finding is vague because the terms "accumulated changes," "cellular functions," and "relevant gene sequences" are ambiguous.

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report and his deposition testimony to support this proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 87). And, moreover, the quoted portion of Dr. Cote's report—i.e., the entire proposed finding—does not contain any factual citation at all, as it originally appeared in Dr. Cote's report. (RX3869 (Cote Report) ¶ 87). Respondents improperly rely only on Dr. Cote's expert testimony in contravention of this Court's Order, and therefore this Court should disregard

Respondents' proposed finding.

[redacted] In addition, Dr. Cote's opinion about sequencing technology is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

> 167.1 With the massive parallel sequencing capability, NGS is scalable and has high throughput, and can systemically study cancer genomes in their entirety, which allows for partial or full characterization of a patient's genomic profile and thus personalized cancer management. (Cote Tr. 3750–51; RX3869 (Cote Expert Report) ¶ 87.)

Response to Finding No. 167.1

The proposed finding is misleading and against the weight of the evidence, it improperly cites expert testimony, and Dr. Cote is not qualified to offer opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote is not reliable.

The proposed finding is misleading to the extent it suggests that non-Illumina NGS platforms can be used for MCED testing. [redacted] The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-

Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report to support this proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 87). And, moreover, the quoted portion of Dr. Cote's report—i.e., the entire proposed finding—does not contain any factual citation at all, as it originally appeared in Dr. Cote's report. (RX3869 (Cote Report) ¶ 87). Respondents improperly rely only on Dr. Cote's expert testimony in contravention of this Court's Order, and therefore this Court should disregard Respondents' proposed finding.

[redacted] In addition, Dr. Cote's opinion about NGS technology is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

> 167.2 However, NGS-based technologies also have their limitations, such as requiring investment in computer capacity and storage to handle the large volume (of tens of gigabytes) of data as well as personnel expertise to skillfully extract and comprehensively analyze and interpret the clinically important information. (RX3869 (Cote Expert Report) ¶ 87.)

Response to Finding No. 167.2

The proposed finding is vague and improperly cites expert testimony. Dr. Cote is not qualified to offer opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote is not reliable.

The proposed finding is vague because the opening word "however" is provided without

context. Additionally, Respondents do not specify the amount of investment required for computer capacity and storage as well as personnel expertise.

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report to support this proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 87). And, moreover, the quoted portion of Dr. Cote's report—i.e., the entire proposed finding—does not contain any factual citation at all, as it originally appeared in Dr. Cote's report. (RX3869 (Cote Report) ¶ 87). Respondents improperly rely only on Dr. Cote's expert testimony in contravention of this Court's Order, and therefore this Court should disregard Respondents' proposed finding.

[redacted] In addition, Dr. Cote's opinion about NGS technology is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

168. GRAIL's Galleri is the only NGS-based early cancer screening test currently on the market in the United States and is currently marketed at $949 per test. (Bishop (GRAIL) Tr. 1401; RX3292 (GRAIL).) No NGS-based early cancer screening tests have obtained FDA approval or mechanisms for reimbursement, either by Medicare or by private payors. (PX7086 (Cance (ACS) Dep.) at 49, 58; RX3869 (Cote Expert Report) ¶ 88.)

Response to Finding No. 168

The proposed finding is misleading, and Dr. Cote is not qualified to offer opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote is not reliable.

[redacted]

- [redacted]
- [redacted]
- [redacted]

[redacted]

- [redacted]

- [redacted]

The proposed finding is also misleading because—like numerous of Respondents' other proposed findings—it is copied and pasted verbatim from Dr. Cote's report and represents only his opinion rather than market realities. (RX3869 (Cote Report) ¶ 88). [redacted]

[redacted] In addition, Dr. Cote's opinion about the process and timeline for developing a multicancer screening test is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight and should disregard the proposed finding.

f. Multiomics

169. An increasing number of companies are developing "multi-omic" tests which combine information from multiple analytes, including DNA (genome), RNA (transcriptome) and protein (proteome) for increased sensitivity in cancer detection. [redacted]; RX3869 (Cote Expert Report) ¶ 89.)

Response to Finding No. 169

[redacted]

[redacted]

169.1 For example, Exact/Thrive's CancerSEEK pipeline screening test assesses levels of nine protein biomarkers as well as mutations in 16 genes for the early detection of cancers of multiple organs: ovary, liver, stomach, pancreas, esophagus, kidney,

bladder, colorectum, lung or breast, in addition to a PET-CT step for positive test results. (RX3419 (Lennon et al., 2020) at 6; Cote Tr. 3811–12.)

Response to Finding No. 169.1

The proposed finding is vague, misleading, and against the weight of the evidence. Dr. Cote is not qualified to offer opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote is not reliable.

The proposed finding is vague because the opening phrase "for example" is provided without context.

The proposed finding is misleading to the extent it suggests that proteomics is an alternative or replacement for Illumina NGS for MCED testing. [redacted]

The proposed finding is also misleading because—like numerous of Respondents' other proposed findings—it is copied and pasted verbatim from Dr. Cote's report and represents only his opinion rather than market realities. (RX3869 (Cote Report) ¶ 89). [redacted] In addition, Dr. Cote's opinion about Exact's process and timeline for developing a multicancer screening test is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed

publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight and should disregard the proposed finding.

> 169.2 Freenome similarly combines data from whole-genome sequencing, DNA methylation, and protein quantification for the early detection of colorectal cancer from a blood test. (RX3426 (Lin et al., 2021) at 1; RX0111 (Putcha et al., 2020) at 1); Cote Tr. 3844.)

Response to Finding No. 169.2

The proposed finding is vague and misleading. The proposed finding is vague because the term "protein quantification" is undefined, and the term "similarly" is provided without context.

The proposed finding is misleading to the extent it suggests that proteomics is an alternative or replacement for Illumina NGS for MCED testing. [redacted]

The proposed finding is also misleading because—like numerous of Respondents' other proposed findings—it is copied and pasted verbatim from Dr. Cote's report and represents only his opinion rather than market realities. (RX3869 (Cote Report) ¶ 89). [redacted] In addition, Dr.

Cote's opinion about Freenome's process and timeline for developing a multicancer screening test is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight and should disregard the proposed finding.

169.3 PrognomiQ, a recent spin-off of Seer, is also developing early cancer screening tests by combining proteomic information, obtainable using Seer's Proteograph platform, with genomic, metabolomic, and other health data. (RX3587 (PrognomiQ) at 1–2; RX3869 (Cote Expert Report) ¶ 89.)

Response to Finding No. 169.3

The proposed finding misattributes the source of a document and is vague, misleading, and against the weight of the evidence. Dr. Cote is not qualified to offer opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote is not reliable.

Complaint Counsel objects to the attribution of RX3587 (which Respondents appear to have captured from PorgnomiQ's website) to PrognomiQ as the source of the document, in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3. No discovery was taken in this matter from PrognomiQ, and the document was not produced by PrognomiQ. The document constitutes hearsay. Given the inherent unreliable nature of this document, it has little to no probative value. (*See* Rule 4.43(b)).

The proposed finding is vague because the terms "proteomic information" and "genomic, metabolomic, and other health data" are ambiguous.

The proposed finding is misleading to the extent it suggests that proteomics is an alternative or replacement for Illumina NGS for MCED testing. [redacted]

[redacted]

The proposed finding is also misleading because—like numerous of Respondents' other proposed findings—it is copied and pasted verbatim from Dr. Cote's report and represents only his opinion rather than market realities. (RX3869 (Cote Report) ¶ 89). Dr. Cote is not qualified to provide expert opinion testimony about PrognomiQ's process and timeline for developing a multicancer screening test because he has no experience developing such tests (*see* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)). Dr. Cote is also not credible (*see* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects). In addition, Dr. Cote's opinion about PrognomiQ's process and timeline for developing a multicancer screening test is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight and should disregard the proposed finding.

C. Features of Cancer Screening Tests

170. The metrics that may be used to assess the performance of oncology tests, including blood-based early stage cancer screening tests include sensitivity, specificity and cancer signal of origin (also known as tissue of origin) analyses. [redacted]; Cote Tr. 3778–82; RX3869 (Cote Expert Report) ¶ 90.)

Response to Finding No. 170

[redacted]

171. In addition to the number of cancers that a screening test is capable of detecting, these metrics provide further grounds for differentiating between different tests and defining whether physicians are likely to substitute one test for another. (Cote Tr. 3778–82; RX3869 (Cote Expert Report) ¶ 90.) In addition to these technical metrics, physicians may also evaluate and select tests based on other factors, such as the ease of using the test. (RX3869 (Cote Expert Report) ¶ 90.)

Response to Finding No. 171

The proposed finding is unreliable, vague, and improperly cites expert testimony. The proposed finding is improper because this Court held that experts shall not be cited to "support

factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report and his trial testimony to support this proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 90. And, moreover, the quoted portion of Dr. Cote's report—i.e., the entire proposed finding—does not contain any factual citation at all, as it originally appeared in Dr. Cote's report. (RX3869 (Cote Report) ¶ 90). Respondents improperly rely only on Dr. Cote's expert testimony in contravention of this Court's Order, and therefore this Court should disregard Respondents' proposed finding.

Dr. Cote is not qualified to provide expert opinion testimony about the performance metrics for multicancer screening tests because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)). Further, Dr. Cote is neither a board-certified medical oncologist nor a primary care physician, as such it is not within his job to order cancer screening tests for patients. (Cote, Tr. 3978-79). In addition, Dr. Cote is not credible (*see* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects), and his opinion about the performance metrics of MCED tests is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

The proposed finding is vague because the terms "these metrics" and "these technical metrics" are provided without context. Additionally, the term "other factors" is ambiguous and

vague.

172. Sensitivity. Sensitivity, also called the true positive rate, measures the proportion of actual positive samples that are correctly identified as such, or how often a test correctly generates a positive result for people who have the condition for which they are being tested. (RX3869 (Cote Expert Report) ¶ 91.) Low sensitivity leads to high *false negative* rates. (Cote Tr. 3778–81; RX3869 (Cote Expert Report) ¶ 91.)

Response to Finding No. 172

Complaint Counsel does not disagree with the proposed finding.

172.1 A concept that is related to false negative rate is the Negative Predictive Value ("NPV"), which is the percentage of patients with a negative test who do not have cancer. (RX3869 (Cote Expert Report) ¶ 91.) NPV represent the probability a patient does not have cancer when the test result is negative. (RX3869 (Cote Expert Report) ¶ 91.)

Response to Finding No. 172.1

Complaint Counsel does not disagree with the proposed finding.

172.2 Compared with therapy selection tests where the patient has developed tumors, early stage cancer patients have only small amounts of cancer cells in the body and only a minute amount of materials from cancer, including circulating tumor DNA (ctDNA), mRNA, protein, and circulating cancer cells, in the blood. (RX3303 (Haque et al., 2017) at 3); Cote Tr. 3735–36.)

Response to Finding No. 172.2

Complaint Counsel objects to the proposed finding because it is vague and misleading.

The proposed finding is vague because the terms "small amounts" and "minute amount" are undefined. The proposed finding is also vague because it does not identify all of the "materials from cancer" referenced.

The proposed finding is also misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted verbatim from Dr. Cote's report and represents his opinion rather than market realities. Therefore, this Court should disregard the proposed finding.

172.3 Therefore, a relatively high sensitivity is an important requirement for an early cancer screening test designed for use in asymptomatic individuals. (Cote Tr. 3778–81; RX3869 (Cote Expert Report) ¶ 92.)

Response to Finding No. 172.3

Complaint Counsel objects to the proposed finding because it is vague, confusing, unsupported, and it improperly cites expert testimony.

The proposed finding is vague because the term "relatively high sensitivity" is imprecise.

The proposed finding is confusing because an "early cancer screening test" is by definition "designed for use in asymptomatic individuals."

The proposed finding is unsupported because the only sources cited are Dr. Cote's trial testimony and expert report, neither of which, in turn, provides any additional support for

This Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only source to establish a purported fact in contravention of this Court's Order. The Court should disregard this evidence and the proposed finding.

173. Specificity. Specificity, or the true negative rate, measures the proportion of actual negative samples that are correctly identified as such, or how often a test correctly generates a negative result for people not having the condition for which they are being tested. (Cote Tr. 3778–3781; RX3869 (Cote Expert Report) ¶ 93.) Low specificity leads to high *false positive* rates. (Cote Tr. 3778–3781; RX3869 (Cote Expert Report) ¶ 93.)

Response to Finding No. 173

Complaint Counsel does not disagree with the proposed finding.

173.1 [redacted]

Response to Finding No. 173.1

[redacted]

[redacted]

173.2 [redacted]

Response to Finding No. 173.2

[redacted]

[redacted]

174. Positive Predictive Value. A concept that is related to false positive rate is the Positive Predictive Value ("PPV"), which is the percentage of patients with a positive test who actually have cancer. (Cote Tr. 3778–81; RX3869 (Cote Expert Report) ¶ 93.)

Response to Finding No. 174

Complaint Counsel does not disagree with the proposed finding.

174.1 PPV represent the probability a patient has cancer when the test result is positive. (Cote Tr. 3779; RX3869 (Cote Expert Report) ¶ 93.) The PPV is a particularly important metric for cancer screening tests. (Cote Tr. 3778–81; RX3869 (Cote Expert Report) ¶ 93.)

Response to Finding No. 174.1

Complaint Counsel does not disagree with the first sentence of the proposed finding.

The remainder of the proposed finding is unreliable, vague, and improperly cites expert testimony. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report and his trial testimony to support this proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 93). And, moreover, the quoted portion of Dr. Cote's report—i.e., the entire proposed finding—does not contain any factual citation at all, as it originally appeared in Dr. Cote's report. (RX3869 (Cote Report) ¶ 93). Respondents improperly rely only on Dr. Cote's expert testimony in contravention of this Court's Order, and therefore this Court should disregard Respondents' proposed finding.

Dr. Cote is not qualified to provide expert opinion testimony about the performance

metrics for multicancer screening tests because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)). Further, Dr. Cote is neither a board-certified medical oncologist nor a primary care physician, as such it is not within his job to order cancer screening tests for patients. (Cote, Tr. 3978-79). In addition, Dr. Cote is not credible (*see* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects), and his opinion about the performance metrics of MCED tests is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

The proposed finding is vague because the term "particularly important" is ambiguous.

175. Because a cancer screening test is a test used in the general population, *i.e.*, healthy individuals, the baseline rate of cancer in that population is very low. (Cote Tr. 3778–81; RX3869 (Cote Expert Report) ¶ 93.) As a result, the rate of true positives—individuals with cancer in the population—will be extremely low, around 4 in 1000 individuals. (RX3501 (National Cancer Institute, Cancer Statistics).)

Response to Finding No. 175

The proposed finding is misleading, improper, unreliable, and vague. Respondents' citation to RX3501 is in contravention of this Court's order that "[w]hen citing to exhibits, the parties shall identify the document by the PX or RX number, followed by the name of the entity that produced the document, and the page number." (Order on Post-Trial Findings at 3). RX3501 is a multi-page document; Respondents fail to provide a citation to any specific page number or page range in contravention of the Court's Order. Thus, the Court should disregard this proposed evidence. Respondents' citation to RX3501 is also misleading because Respondents fail to identify Dr. Cote's report as the source from which the entire finding was

copied and pasted verbatim. (RX3869 (Cote Report) ¶ 93).

The first sentence of Respondents' proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report and his trial testimony to support this portion of the proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 93). Respondents improperly rely only on Dr. Cote's testimony in contravention of this Court's Order, and therefore this Court should disregard the first sentence of Respondents' proposed finding.

Dr. Cote is not qualified to provide expert opinion testimony about the performance metrics for multicancer screening tests because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)). Further, Dr. Cote is neither a board-certified medical oncologist nor a primary care physician, as such it is not within his job to order cancer screening tests for patients. (Cote, Tr. 3978-79). In addition, Dr. Cote is not credible (*see* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects)), and his opinion about the performance metrics of MCED tests is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

The proposed finding is vague because the term "very low" is ambiguous. It is unclear what constitutes a "very low" baseline rate of cancer. Therefore, this Court should disregard the

proposed finding.

176. Therefore, even if a test is highly specific with a low false positive rate, the likelihood that a person with a positive test result actually has cancer may still be relatively low given the low baseline rate of cancer in the population. (Cote Tr. 3778–81; RX3869 (Cote Expert Report) ¶ 93).

Response to Finding No. 176

The proposed finding is unreliable, vague, and improperly cites expert testimony. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report and his trial testimony to support this proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 93). And, moreover, the quoted portion of Dr. Cote's report—i.e., the entire proposed finding—does not contain any factual citation at all, as it originally appeared in Dr. Cote's report. (RX3869 (Cote Report) ¶ 93). Respondents improperly rely only on Dr. Cote's expert testimony in contravention of this Court's Order, and therefore this Court should disregard Respondents' proposed finding.

Dr. Cote is not qualified to provide expert opinion testimony about the performance metrics for multicancer screening tests because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)). Further, Dr. Cote is neither a board-certified medical oncologist nor a primary care physician, as such it is not within his job to order cancer screening tests for patients. (Cote, Tr. 3978-79). In addition, Dr. Cote is not credible (*see* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects), and his opinion about the performance metrics of MCED tests is unreliable given that

his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

The proposed finding is vague because the terms "highly specific," "low false positive rate," "relatively low," and "low baseline rate" are all ambiguous. Additionally, the opening phrase "therefore" is provided without context.

> 176.1 For example, a specificity of 99.5% still translates into about a 40– 50% PPV—one of every two individuals with a positive test result would be a false positive. (Cote Tr. 3778–81; RX3869 (Cote Expert Report) ¶ 93.)

Response to Finding No. 176.1

Complaint Counsel objects to the proposed finding because it is unsupported, vague, confusing, misleading, and noncompliant with Part 3 rules, and because Dr. Cote is not qualified to provide opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

The proposed finding is vague because "about a 40– 50% PPV" is imprecise and unclear.

The proposed finding is vague and confusing because calculating PPV requires values for test specificity, test sensitivity, and disease prevalence. The proposed finding only includes a value for test specificity; it does not include values for test sensitivity or disease prevalence.

The proposed finding is unsupported because it does not provide the test sensitivity or disease prevalence values required to calculate PPV, nor does it set forth the calculation underlying the purported example. Accordingly, there is no basis for the claim that "a specificity of 99.5%" translates into "about a 40– 50% PPV." Respondents cite Dr. Cote's report and testimony as support, but neither source supplies the missing values nor performs the calculation underlying the purported example. Dr. Cote's private calculation of PPV violates the

Part 3 rules (*see* 16 C.F.R. § 3.31A(c) (requiring that expert reports "contain a complete statement of all opinions to be expressed and the basis and reasons therefor" as well as the "data, materials, or other information considered by the witness in forming the opinions")) and prevents this Court from even assessing his method. This Court should reject this purported expert testimony as noncompliant, unsupported, and unreliable.

The proposed finding is also misleading because—like numerous of Respondents' other proposed findings—it is copied and pasted verbatim from Dr. Cote's report and represents only his opinion rather than market realities. Dr. Cote is not qualified to provide expert opinion testimony about the performance metrics for multicancer screening tests because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)). Further, Dr. Cote is neither a board-certified medical oncologist nor a primary care physician, as such it is not within his job to order workup for patients who have tested positive for cancer. (Cote, Tr. 3978-79). Dr. Cote is also not credible (*see* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across subjects). In addition, Dr. Cote's opinion about the performance attributes of MCED tests is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight and should disregard the proposed finding.

177. Both false positive results and false negative results of a cancer screening test will have significant negative impact on the patient's well-being. ([redacted] 3778–81, 3814, [redacted]; RX3869 (Cote Expert Report) ¶ 94; *see also* PX7086 (Cance (ACS) Dep. at 90–91.)

Response to Finding No. 177

Complaint Counsel has no specific response to the proposed finding.

178. False negative findings cause physicians to not diagnose a cancer that either is already causing or will soon cause harm to patients, and miss precious early treatment opportunities; false positive results leads to unnecessary follow-ups and even often harmful procedures to rule out cancer, let alone the severe emotional distress to patients and their families. [redacted] 3778–81, 3814, [redacted]; RX3869 (Cote Expert Report) ¶ 94; *see also* PX7086 (Cance (ACS) Dep. at 90–91.)

Response to Finding No. 178

Complaint Counsel has no specific response to the proposed finding.

179. Therefore, high specificity, *i.e.*, low false positive rates, is also important for a cancer screening test. ([redacted] 3778–81, 3814, [redacted]; RX3869 (Cote Expert Report) ¶ 94; *see also* PX7086 (Cance (ACS) Dep. at 90–91.)

Response to Finding No. 179

The proposed finding is vague because the terms "high specificity" and "low false positive rates" are ambiguous. Additionally, the terms "therefore" and "also" are provided without context. Therefore, this Court should disregard the proposed finding.

180. However, there is typically a tradeoff between specificity and sensitivity. (RX3869 (Cote Expert Report) ¶ 95.) Given the same conditions, a test applying cutoff thresholds that minimizes false positives, *i.e.*, higher specificity, may often have a lower sensitivity than a test that results in a higher false positive rate. (RX3869 (Cote Expert Report) ¶ 95.)

Response to Finding No. 180

The proposed finding is unreliable, vague, and improperly cites expert testimony. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report to support this proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 95). And, moreover, the quoted portion of Dr. Cote's report—i.e., the entire proposed finding—does not contain any factual citation at all, as it originally appeared in Dr. Cote's report. (RX3869 (Cote Report) ¶ 95).

Respondents improperly rely only on Dr. Cote's expert testimony in contravention of this Court's Order, and therefore this Court should disregard Respondents' proposed finding.

Dr. Cote is not qualified to provide expert opinion testimony about the performance metrics for multicancer screening tests because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)). Further, Dr. Cote is neither a board-certified medical oncologist nor a primary care physician, as such it is not within his job to order cancer screening tests for patients. (Cote, Tr. 3978-79). In addition, Dr. Cote is not credible (*see* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects), and his opinion about the performance metrics of MCED tests is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

The proposed finding is vague because it does not specify what is meant by the "same conditions," the terms "typically," "tradeoff," and "may often have" are ambiguous, and the opening word "however" is provided without context.

> 180.1 Existing single cancer screening tests typically have very high sensitivity rates and correspondingly lower specificity/higher false positive rates. (RX3869 (Cote Expert Report) ¶ 95.)

Response to Finding No. 180.1

The proposed finding is unreliable, vague, and improperly cites expert testimony. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's

expert report, and Respondents cite only to Dr. Cote's report to support this proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 95). And, moreover, the quoted portion of Dr. Cote's report—i.e., the entire proposed finding—does not contain any factual citation at all, as it originally appeared in Dr. Cote's report. (RX3869 (Cote Report) ¶ 95). Respondents improperly rely only on Dr. Cote's expert testimony in contravention of this Court's Order, and therefore this Court should disregard Respondents' proposed finding.

Dr. Cote is not qualified to provide expert opinion testimony about the performance metrics for multicancer screening tests because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)). Further, Dr. Cote is neither a board-certified medical oncologist nor a primary care physician, as such it is not within his job to order cancer screening tests for patients. (Cote, Tr. 3978-79). In addition, Dr. Cote is not credible (*see* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects), and his opinion about the performance metrics of MCED tests is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

The proposed finding is vague because the terms "very high sensitivity rates" and "typically" are ambiguous. Additionally, the proposed finding fails to provide examples of any existing single cancer screening tests with very high sensitivity rates.

> 180.2 For example, a colonoscopy has a sensitivity of 92.5% and a specificity of 73.2%. (RX3393 (Issa & Noureddine 2017) at 9.) Cologuard has a sensitivity of 92.3% and a specificity of 86.6%. (RX3222 (FDA) at 19.)

Response to Finding No. 180.2

The proposed finding is misleading because Respondents fails to identify Dr. Cote's report as the source from which the proposed finding was copied and pasted verbatim. (RX3869 (Cote Report) ¶ 95). Therefore, this Court should disregard the proposed finding.

> 180.3 Mammography for breast cancer screening has a sensitivity of 86.9% and a specificity of 88.9%, and the PPV is only 4%, meaning that only 4 of 100 positive tests actually identify breast cancer. (RX3079 (Breast Cancer Surveillance Consortium) at 1; RX3442 (Marcus 2019) at 4.)

Response to Finding No. 180.3

The proposed finding is misleading because Respondents fails to identify Dr. Cote's report as the source from which the proposed finding was copied and pasted verbatim. (RX3869 (Cote Report) ¶ 95). Therefore, this Court should disregard the proposed finding.

> 180.4 This means that most patients with a "positive" mammography result will have to undergo further invasive testing, but will end up with a negative cancer diagnosis. (RX3079 (Breast Cancer Surveillance Consortium) at 1; RX3442 (Marcus 2019) at 6.)

Response to Finding No. 180.4

The proposed finding is unsupported, misleading, and vague. The proposed finding is unsupported because RX3079 does not mention further invasive testing for patients with a positive mammography result, only a "recommendation for immediate follow-up." (RX3079 at 1 (Breast Cancer Surveillance Consortium)).

Respondents' citation to RX3442 is misleading to the extent that the proposed finding suggests that false positives are a harm to patients. The article explains that: "There is disagreement as to whether false positives should be classified as a harm of cancer screening. One point of view is that any test, including the diagnostic evaluation tests that accompany a false positive, is a test worth having if it rules out cancer. The other point of view is that false positives are a harm of cancer screening as they cause patients to worry unnecessarily and to receive unneeded medical tests and procedures, some of which can be risky." (RX3442 at 6

(Marcus PM, Assessment of Cancer Screening: A Primer, National Cancer Institute (2019)). Only one point of view is presented in the proposed finding. The proposed finding is also misleading because Respondents fails to identify Dr. Cote's report as the source from which the proposed finding was copied and pasted verbatim. (RX3869 (Cote Report) ¶ 95).

The proposed finding is vague because the opening word "this" is provided out of context. Additionally, Respondents fail to specify what further testing patients will have to undergo or how it will be invasive. Therefore, this Court should disregard the proposed finding.

181. A test developer focusing on a cancer screening test for a large number of cancer types must focus on attaining a very high specificity rate, and a high PPV, which will often result in correspondingly lower sensitivity rates. (Cote Tr. 3778–81; RX3869 (Cote Expert Report) ¶ 95.) This is because when screening the general population of individuals over age 50, or those with a family history of cancer, it is critical that the morbidity and expense of following up on a false positive test is minimized. (RX3869 (Cote Expert Report) ¶ 95.)

Response to Finding No. 181

The proposed finding is unreliable, vague, and improperly cites expert testimony. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report and his trial testimony to support this proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 95). And, moreover, the quoted portion of Dr. Cote's report—i.e., the entire proposed finding—does not contain any factual citation at all, as it originally appeared in Dr. Cote's report. (RX3869 (Cote Report) ¶ 95). Respondents improperly rely only on Dr. Cote's expert testimony in contravention of this Court's Order, and therefore this Court should disregard Respondents' proposed finding.

Dr. Cote is not qualified to provide expert opinion testimony about the performance

metrics for multicancer screening tests because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)). Further, Dr. Cote is neither a board-certified medical oncologist nor a primary care physician, as such it is not within his job to order cancer screening tests for patients. (Cote, Tr. 3978-79). In addition, Dr. Cote is not credible (*see* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects), and his opinion about the performance metrics of MCED tests is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

The proposed finding is vague because the terms "large number of cancer types," "often result," and "following up" are ambiguous.

> 181.1 By contrast, a test developer focusing on a single cancer screening test or a test directed to only a handful of targeted cancer types may elect to focus on sensitivity more than specificity. (PX6097 (Abrams Expert Report) ¶ 29; RX3869 (Cote Expert Report) ¶ 95.) This again points out the fundamental differences in design that are likely to differentiate tests used to detect early stage cancer. (Cote Tr. 3778–81, 3868–69; RX3869 (Cote Expert Report) ¶ 95.)

Response to Finding No. 181.1

Complaint Counsel objects to the proposed finding because it is vague, misleading, and unsupported, Dr. Cote is not qualified to offer opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is unreliable.

The proposed finding is vague because it is unclear what "focusing on" a single cancer screening test means, and it does not define "only a handful." The proposed finding is also vague in its use of "may."

The proposed finding is misleading to the extent it suggests that differences among MCED tests will prevent them from competing in the same product market**.** [redacted]

[redacted]

Dr. Cote is not qualified to provide expert opinion testimony about the performance metrics for multicancer screening tests because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)). Further, Dr. Cote is neither a board-certified medical oncologist nor a primary care physician, as such it is not within his job to order workup for patients who have tested positive for cancer. (Cote, Tr. 3978-79). Dr. Cote is also not credible (*see* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across subjects). In addition, Dr. Cote's opinion about the performance attributes of MCED tests is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight and should disregard the proposed finding.

182. Cancer Signal of Origin. A blood test, unlike a biopsy of a specific organ, does not automatically indicate the possible cancer signal of origin for the cancer to be detected. (Cote Tr. 3782; RX3869 (Cote Expert Report) ¶ 96.)

Response to Finding No. 182

The proposed finding is unreliable, vague, and improperly cites expert testimony. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report to support this proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 96). And, moreover, the quoted

portion of Dr. Cote's report—i.e., the entire proposed finding—does not contain any factual citation at all, as it originally appeared in Dr. Cote's report. (RX3869 (Cote Report) ¶ 96). Respondents improperly rely only on Dr. Cote's expert testimony in contravention of this Court's Order, and therefore this Court should disregard Respondents' proposed finding.

Dr. Cote is not qualified to provide expert opinion testimony about the performance metrics for multicancer screening tests because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)). Further, Dr. Cote is neither a board-certified medical oncologist nor a primary care physician, as such it is not within his job to order cancer screening tests for patients. (Cote, Tr. 3978-79). In addition, Dr. Cote is not credible (*see* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects), and his opinion about the performance metrics of MCED tests is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

The proposed finding is vague because the terms "blood test" and "possible signal of origin" are ambiguous, and it does not explain what it means that a test "does not automatically indicate" the possible signal of origin means. It is unclear if the proposed finding refers to blood-based MCED tests specifically or blood tests generally.

> 182.1 Therefore, for a blood-based multi-cancer screening test to be most effective, identification of the possible cancer signal of origin is highly desirable. (RX3869 (Cote Expert Report) ¶ 96.)

Response to Finding No. 182.1

The proposed finding is improper, unreliable, and vague. The proposed finding is

improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report to support this proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 96). And, moreover, the quoted portion of Dr. Cote's report—i.e., the entire proposed finding—does not contain any factual citation at all, as it originally appeared in Dr. Cote's report. (RX3869 (Cote Report) ¶ 96). Respondents improperly rely only on Dr. Cote's expert opinion in contravention of this Court's Order, and therefore this Court should disregard Respondents' proposed finding.

Dr. Cote is not qualified to provide expert opinion testimony about the performance metrics for multicancer screening tests because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)). Further, Dr. Cote is neither a board-certified medical oncologist nor a primary care physician, as such it is not within his job to order cancer screening tests for patients. (Cote, Tr. 3978-79). In addition, Dr. Cote is not credible (*see* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects), and his opinion about the performance metrics of MCED tests is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

The proposed finding is vague because the terms "most effective," "highly desirable," and "possible cancer signal of origin" are ambiguous. Additionally, the opening word

"therefore" is provided without context.

182.2 [redacted]

Response to Finding No. 182.2

[redacted]

182.3 Identification of a cancer signal of origin ensures that the necessary follow-up from a positive test result is efficiently directed to a targeted imaging step or a biopsy, such that those patients who receive a positive test result will not suffer undue anxiety waiting for further testing. (RX3869 (Cote Expert Report) ¶ 96.)

Response to Finding No. 182.3

The proposed finding is misleading, unreliable, vague, and improperly cites expert testimony. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from

Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report to support this proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 96). And, moreover, the quoted portion of Dr. Cote's report—i.e., the entire proposed finding—does not contain any factual citation at all, as it originally appeared in Dr. Cote's report. (RX3869 (Cote Report) ¶ 96). Respondents improperly rely only on Dr. Cote's expert testimony in contravention of this Court's Order, and therefore this Court should disregard Respondents' proposed finding.

[redacted] Dr. Cote is not qualified to provide expert opinion testimony about the performance metrics for multicancer screening tests because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)). Further, Dr. Cote is neither a board-certified medical oncologist nor a primary care physician, as such it is not within his job to order workup for patients who have tested positive for cancer. (Cote, Tr. 3978-79). In addition, Dr. Cote is not credible (*see* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects), and his opinion about the performance metrics of MCED tests is unreliable given that his analysis has not been subject to

nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

The proposed finding is vague because the term "targeted imaging step" is undefined, and the term "undue anxiety" is ambiguous.

> 182.4 Importantly, a cancer screening test that is capable of detecting multiple cancer types that returns a positive result, but does not indicate the possible cancer signal of origin, would result in a possibly extensive, invasive and expensive workup to rule in or out the presence of cancer. ([redacted] 3782, 3814, [redacted] RX3869 (Cote Expert Report) ¶ 97.)

Response to Finding No. 182.4

The proposed finding is misleading, unreliable, vague, and improperly cites expert testimony. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report and his trial testimony to support this proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 97). And, moreover, the quoted portion of Dr. Cote's report—i.e., the entire proposed finding—does not contain any factual citation at all, as it originally appeared in Dr. Cote's report. (RX3869 (Cote Report) ¶ 97). Respondents improperly rely only on Dr. Cote's expert testimony in contravention of this Court's Order, and therefore this Court should disregard Respondents' proposed finding.

[redacted]

[redacted]

Dr. Cote is not qualified to provide expert opinion testimony about the performance metrics for multicancer screening tests because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)). Further, Dr. Cote is neither a board-certified medical oncologist nor a primary care physician, as such it is not within his job to order workup for patients who have tested positive for cancer. (Cote, Tr. 3978-79). In addition, Dr. Cote is not credible (*see* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects), and his opinion about the performance metrics of MCED tests is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

The proposed finding is vague because the term "possibly extensive, invasive, and expensive workup" is ambiguous. Respondents fail to specify what kind of workup patients might have to undergo or how it will be extensive, invasive, and expensive

> 182.5 No cancer screening test will be perfect, and even at the extremely high PPV of 50%, only one half of the patients with a positive screening test will actually have cancer. (Cote Tr. 3778–81; RX3869 (Cote Expert Report) ¶ 97.)

Response to Finding No. 182.5

The proposed finding is unreliable and improperly cites expert testimony. The proposed

finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report to support this proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 97). And, moreover, the quoted portion of Dr. Cote's report—i.e., the entire proposed finding—does not contain any factual citation at all, as it originally appeared in Dr. Cote's report. (RX3869 (Cote Report) ¶ 97). Respondents improperly rely only on Dr. Cote's expert testimony in contravention of this Court's Order, and therefore this Court should disregard Respondents' proposed finding.

Dr. Cote is not qualified to provide expert opinion testimony about the performance metrics for multicancer screening tests because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)). Further, Dr. Cote is neither a board-certified medical oncologist nor a primary care physician, as such it is not within his job to order cancer screening tests for patients. (Cote, Tr. 3978-79). In addition, Dr. Cote is not credible (*see* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects), and his opinion about the performance metrics of MCED tests is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

182.6 In the above example of a test with a PPV of 50%, the workup would likely be even more prolonged, invasive and expensive for the patients who do not have cancer than for a patient who does have cancer, as the patient without cancer would be

forced to undergo a particularly extensive workup to definitively rule out cancer. ([redacted] 3782, 3814, [redacted]; RX3869 (Cote Expert Report) ¶ 97.)

Response to Finding No. 182.6

The proposed finding is unreliable, vague, and improperly cites expert testimony. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report to support this proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 97). And, moreover, the quoted portion of Dr. Cote's report—i.e., the entire proposed finding—does not contain any factual citation at all, as it originally appeared in Dr. Cote's report. (RX3869 (Cote Report) ¶ 97). Respondents improperly rely only on Dr. Cote's expert testimony in contravention of this Court's Order, and therefore this Court should disregard Respondents' proposed finding.

Dr. Cote is not qualified to provide expert opinion testimony about the performance metrics for multicancer screening tests because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)). Further, Dr. Cote is neither a board-certified medical oncologist nor a primary care physician, as such it is not within his job to order workup for patients who have tested positive for cancer. (Cote, Tr. 3978-79). In addition, Dr. Cote is not credible (*see* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects), and his opinion about the performance metrics of MCED tests is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not

accord Dr. Cote's opinion any weight.

The proposed finding is vague because Respondents fail to specify what kind of workup patients might have to undergo or how it will be prolonged, invasive, and expensive.

> 182.7 On the other hand, a multi-cancer screening test that *does* indicate the possible cancer signal of origin will require much less extensive and more focused initial follow-up. (Cote Tr. 3782; RX3869 (Cote Expert Report) ¶ 97.)

Response to Finding No. 182.7

Complaint Counsel objects to the proposed finding because it is vague, misleading, and incomplete, Dr. Cote is not qualified to offer opinion testimony on this topic, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

The proposed finding is vague because it does not define what it means to indicate the "possible" cancer signal of origin.

[redacted]

The proposed finding is incomplete and misleading to the extent that it suggests that there is agreement or consensus that algorithmic tissue of origin prediction will ultimately prove superior to other methods of identifying the location of cancer as part of MCED testing, such as PET-CT. [redacted]

[redacted]

The proposed finding is also misleading because—like numerous of Respondents' other proposed findings—it is copied and pasted verbatim from Dr. Cote's report and represents only his opinion rather than market realities. Dr. Cote is not qualified to provide expert opinion testimony about the performance metrics for multicancer screening tests because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)). Further, Dr. Cote is neither a board-certified medical oncologist nor a primary care physician, as such it is not within his job to order workup for patients who have tested positive for cancer. (Cote, Tr. 3978-79). Dr. Cote is also not credible (*see* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across subjects). In addition, Dr. Cote's opinion about the performance attributes of MCED tests is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight and should disregard the proposed finding.

> 182.8 Providing accurate cancer signal of origin to facilitate cancer diagnosis will improve clinical utility and patient compliance, thus impact decision-making by physicians using cancer screening tests. (PX6097 (Abrams Expert Report), ¶¶ 10.g, 22, 27; RX3869 (Cote Expert Report) ¶ 97–98; Cote Tr. 3782.)

Response to Finding No. 182.8

The proposed finding is improper, unreliable, and vague. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report, Dr. Cote's trial testimony, and Dr. Abrams's report to

support this proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 97). Respondents improperly rely only on Dr. Cote's and Dr. Abrams's expert opinions in contravention of this Court's Order, and therefore this Court should disregard Respondents' proposed finding.

Dr. Cote is not qualified to provide expert opinion testimony about the performance metrics for multicancer screening tests because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)). Further, Dr. Cote is neither a board-certified medical oncologist nor a primary care physician, as such it is not within his job to order cancer screening tests for patients. (Cote, Tr. 3978-79). In addition, Dr. Cote is not credible (*see* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects), and his opinion about the performance metrics of MCED tests is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

[redacted]

The proposed finding is vague because the terms "clinical utility" and "patient compliance" are undefined, and the term "impact" is ambiguous. The proposed finding is also

vague because it does not specify the manner of "providing accurate cancer signal of origin."

183. Detecting Multiple Cancers. [redacted]

Response to Finding No. 183

[redacted]

D. Regulatory Requirements

184. The FDA is charged with protecting the public health by assuring the safety, effectiveness, and security of medical devices, including diagnostic and screening tests. (RX3006 (FDA); PX7099 (Febbo (Illumina) Dep. at 83–84).)

Response to Finding No. 184

The proposed finding is vague and unsupported and violates the Court's Order. It is unsupported because it includes multiple references to terms and phrases that appear nowhere in the cited sources. Neither RX3066, which appears to be a printout of a portion of the FDA's website, nor the cited testimony of Dr. Febbo mentions anything about the "security" of medical devices. Neither RX3066 nor the cited testimony of Dr. Febbo mentions the terms "screening" or "screening tests." The proposed finding is vague because "charged" and "assuring" are not defined, nor are the terms "security" or "screening tests" which appear in the proposed finding but not in the cited sources. Additionally, this Court ordered that "[w]hen citing to exhibits, the parties shall identify the document by the PX or RX number, followed by the name of the entity that produced the document, and the page number." Order on Post-Trial Findings at 3. RX3006 is a multi-page document; Respondents fail to provide to provide a citation to any specific page

number of page range in RX3006 in contravention of the Court's Order. Finally, the FDA did not "produce" RX3006; the proposed finding is misleading to the extent that implies direct production by the FDA in connection with this proceeding. Therefore, this Court should disregard the proposed finding.

185. Medical devices marketed in the United States must adhere to regulatory requirements as set forth in the Federal Food, Drug, and Cosmetic Act and 21 CFR § 1–58, 800–1299. (RX3326 (FDA) at 1.) Devices are classified as Class I, II or III, where each class corresponds with a differing degree of risk. (RX3326 (FDA) at 2.)

Response to Finding No. 185

RX3326 appears to be a printout of a portion of the FDA's website. The FDA did not "produce" RX3326; the proposed finding is misleading to the extent that implies direct production by the FDA in connection with this proceeding. Beyond that, Complaint Counsel does not disagree with the proposed finding.

185.1 Class I devices are those that present the lowest risk, with minimal potential for patient harm. (RX3326 (FDA) at 2.)

Response to Finding No. 185.1

RX3326 appears to be a printout of a portion of the FDA's website. The FDA did not "produce" RX3326; the proposed finding is misleading to the extent that implies direct production by the FDA in connection with this proceeding. Beyond that, Complaint Counsel does not disagree with the proposed finding.

185.2 Class II devices represent a moderate risk, and Class III devices represent the highest level of risk, used in scenarios where the device is used to sustain or support life, the device is implanted, or the device presents potential unreasonable risk of illness or injury. (RX3326 (FDA) at 2; RX6001 (Deverka Trial Dep. at 39); RX3867 (Deverka Expert Report) ¶ 32.)

Response to Finding No. 185.2

RX3326 appears to be a printout of a portion of the FDA's website. The FDA did not "produce" RX3326, and the proposed finding is misleading to the extent that implies direct

production by the FDA in connection with this proceeding. Beyond that, Complaint Counsel does not disagree with the proposed finding.

186. Depending on the Class of device, the device may require a different level of FDA premarket clearance or approval, or may not require FDA premarket submission at all.' (RX3326 (FDA) at 3; RX3416 (FDA) at 1.)

Response to Finding No. 186

The proposed finding is vague and confusing. The proposed finding is vague because the phrase "different level of FDA premarket clearance or approval" is undefined. The proposed finding is confusing because it is unclear what baseline "different level" is being compared against. The proposed finding is also vague and confusing because no context is provided for the phrase "may require" and so it is unclear whether Respondents are referencing requirements for product development, clinical testing, LDT sales, or FDA approval. Additionally, RX3326 and RX3416 appear to be printouts of a portion of the FDA's website. This Court ordered that "[w]hen citing to exhibits, the parties shall identify the document by the PX or RX number, followed by the name of the entity that produced the document, and the page number." Order on Post-Trial Findings at 3. The FDA did not "produce" RX3326 or RX3416; the proposed finding is misleading to the extent that implies direct production by the FDA in connection with this proceeding. Therefore, this Court should disregard the proposed finding.

187. A company can offer a clinical test to patients in three ways: as a Laboratory Developed Test ("LDT"), as a single-site IVD test, or an IVD distributed kit. (Goswami (Illumina) Tr. 3185–87.)

Response to Finding No. 187

The proposed finding is vague and incomplete. The proposed finding is vague because the context for term "can offer" is unclear. To the extent the finding is intended to describe regulatory requirements, the finding is incomplete in that it does not specify that the listed avenues for offering a clinical test are specific to the U.S. regulatory system. Therefore, this

Court should disregard the proposed finding.

187.1 LDTs are the most common offering and involve a company clinically and analytically validating the test and then running the test in a single laboratory that has received CLIA/CAP certification. (Goswami (Illumina) Tr. 3185, 3195–96.)

Response to Finding No. 187.1

The proposed finding is vague, unsupported, and incomplete. The proposed finding is vague because the terms "most common" and "offering" are undefined. It is unclear whether "most common" refers to the regulatory strategy undertaken by most labs, "most common" in the sense that most total "offerings" used by consumers are LDTs, or something else entirely. The proposed finding is unsupported because Mr. Goswami lacks foundation because he has no personal knowledge of what is "most common" among companies other than Illumina and no other foundation was established for him to make such a statement. The finding is also vague in that it does not specify the meaning of the phrase "clinically and analytically validating." The finding is incomplete in that it omits that LDTs are self-validated by the labs themselves. *See* CCFF ¶¶ 498. For the above reasons, this proposed finding of fact should be disregarded.

187.1.1 While LDTs do not undergo FDA clearance or approval processes, they are regulated by the Clinical Laboratory Improvements Amendments (CLIA) program, which is implemented via a division of the Centers of Medicare and Medicaid Services (CMS) called the Division of Clinical Laboratory Improvement & Quality. (RX3325 (CMS); PX7113 (Rabinowitz (Natera) Dep. at 382); PX7077 (Chahine (Helio) Dep. at 1028); RX3867 (Deverka Expert Report) ¶ 34.)

Response to Finding No. 187.1.1

The proposed finding is vague and incomplete. The proposed finding is vague because it does not define the phrase "regulated by the Clinical Laboratory Improvements Amendments (CLIA) program." The finding is incomplete in that it omits that the compliance certified by the Centers for Medicare & Medicaid Services ("CMS") is the CLIA compliance of the laboratories themselves, *see* CCFF ¶¶ 497, and that LDTs are self-validated by the labs in which the testing is

performed. CCFF ¶¶ 498. Complaint Counsel does not disagree that tests sold as LDTs have not received FDA approval or clearance but notes, for completeness, that LDTs may subsequently receive FDA approval or clearance.

> 187.1.2 Despite not being approved or cleared by the FDA, LDTs still must meet rigorous quality and safety standards for clinical diagnostic testing because it must be run in a laboratory with CLIA certification. (RX3325 (CMS); RX3867 (Deverka Expert Report) ¶ 34.)

Response to Finding No. 187.1.2

The proposed finding is unsupported as it is based on improper expert opinion testimony and citation to an irrelevant website printout that fails to establish the underlying factual matters asserted. RX3325 appears to be a printout of a portion of CMS's website that, oddly, describes the administrative process related to submission of a CLIA application form. RX3325 mentions nothing about quality or safety standards for clinical diagnostic testing – rigorous or otherwise. The only other source cited for the proposed finding is Dr. Deverka's expert report. (In fact, the text of the proposed finding is simply pasted in from Dr. Deverka's report). This Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Deverka in contravention of this Court's Order. Moreover, Dr. Deverka lacks the foundation and requisite expertise to opine on the CLIA certification process for of laboratories. Dr. Deverka readily acknowledges that she is not a regulatory expert, (RX6001 (Deverka Trial Dep. at 126), and has never worked at the Centers for Medicare and Medicaid Services ("CMS"), United States Preventative Services Task Force ("USPSTF"), or FDA. (RX6001 (Deverka Trial Dep. at 126). The only support Dr. Deverka herself cites for her statement is RX3325, which as noted above fails to support the proposed finding. Accordingly, neither RX3325 nor Dr. Deverka's report support the proposed finding. This Court should disregard this evidence. Additionally,

this Court ordered that "[w]hen citing to exhibits, the parties shall identify the document by the PX or RX number, followed by the name of the entity that produced the document, and the page number." Order on Post-Trial Findings at 3. RX3325 is a multi-page document; Respondents fail to provide to provide a citation to any specific page number of page range in the document in contravention of the Court's Order. Finally, CMS did not "produce" RX3325; the proposed finding is misleading to the extent that implies direct production by the CMS in connection with this proceeding. For all the above reasons, this proposed finding of fact should be disregarded.

> 187.1.3 Labs undergo routine audits in which the clinical data supporting their tests and the claims that they put on their reports are reviewed and put their CLIA license at risk if they don't have sufficient data supporting their tests. (Febbo (Illumina) Tr. 4322–23.).

Response to Finding No. 187.1.3

The proposed finding is vague, unreliable, and relies solely on the self-serving testimony of a party executive. The proposed finding is vague because the terms "routine," "audits," "clinical data," "supporting," and "claims that they put on their reports," "reviewed," "at risk," and "sufficient" are undefined. The proposed finding is unreliable because Dr. Febbo does not have a foundation to speak to the experience of "labs" generally. Finally, Respondents cite only to the self-serving testimony of an Illumina Grail executive for factual propositions that are uncorroborated by any ordinary course documents. Given the inherent vagueness and unreliability of this testimony as well as the lack of foundation, this proposed finding of fact should be disregarded.

> 187.2 Single-site IVDs are tests that have been FDA-approved, but only can only be run in a single lab. (Goswami (Illumina) Tr. 3186.)

Response to Finding No. 187.2

Complaint Counsel does not disagree with the proposed finding.

187.3 An distributed IVD test or IVD kit involves a kit that is developed and manufactured by a test manufacturer which, after receiving FDA approval, can be run in various labs provided that the labs are CLIA/CAP certified. (Goswami (Illumina) Tr. 3186–87.)

Response to Finding No. 187.3

Complaint Counsel has no specific response to this proposed finding.

187.3.1 The manufacturer of an IVD distributed test, not the lab running the test, bears the burden of continuing to manufacture, distribute and support the test in accordance with FDA guidelines. (Goswami (Illumina) Tr. 3187.)

Response to Finding No. 187.3.1

Complaint Counsel has no specific response to this proposed finding.

187.3.2 IVD kits are most suitable for tests that have precious samples, that present shipping challenges and require fast turnaround times. (Goswami (Illumina) Tr. 3196–3200.)

Response to Finding No. 187.3.2

The proposed finding is vague and unreliable. The proposed finding is vague because "precious samples," "shipping challenges," and "fast turnaround" are undefined. The proposed finding is unreliable because it represents opinion testimony from a fact witness purporting to speak beyond his personalized experience or the experience of Illumina; Mr. Goswami does not have foundation to opine on the generalized circumstances for which IVD kits "are most suitable." Therefore, this Court should disregard the proposed finding.

188. The below table summarizes the minimum required regulatory submission type required for diagnostic tests depending on the type and class of device. (RX3326 (FDA) at 1–4; RX3416 (FDA) at 1; RX3867 (Deverka Expert Report) ¶ 33.)

Table 1

Regulatory Submission	Eligible Devices	Governing Body	Regulatory Terminology
LDT	Tests that are designed, manufactured and used in a single lab (including RUO/IUO kits) do not require FDA premarket submission. LDTs may be widely	CLIA (CMS)	Not currently reviewed by FDA

Regulatory Submission	Eligible Devices	Governing Body	Regulatory Terminology
	accessible even though all analysis is conducted in a central lab that meets CLIA certification standards.		
510(k)	Required for some Class I and most Class II devices. Manufacturers must demonstrate that the device is substantially equivalent (SE) to (i.e. as safe and effective as) a legally marketed predicate device.	FDA	FDA cleared
De Novo Classification	Provides pathway for Class I and II devices for which there is no legally marketed predicate device.	FDA	FDA cleared
PMA	Class III devices and companion diagnostics (CDxs) require a premarket approval (PMA). The PMA must contain sufficient valid scientific evidence to assure that the device is safe and effective for its intended use(s).	FDA	FDA approved

Response to Finding No. 188

The proposed finding, which consists of a chart pasted verbatim from Dr. Deverka's report, is unsupported and misleading and violates the Court's Post-Trial Order in multiple ways. First, this Court's Post-Trial Order explicitly requires that all facts be supported by "specific references to the evidentiary record." (*See* Order on Post-Trial Findings at 2). Here, Respondents have improperly merged numerous distinct proposed findings of fact together into a chart without providing specific references to the evidentiary record for those individual findings themselves. This proposed composite finding should be disregarded for violating the Court's Order and 16 C.F.R. § 3.46.

Second, Respondents cite Dr. Deverka as a source to support factual statements about regulatory submissions. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Respondents citation to Dr. Deverka contravenes this Court's Order. This Court should disregard this evidence. Dr. Deverka lacks foundation to testify as an expert regarding regulatory matters. Dr. Deverka testified during her trial deposition that she is neither an FDA

expert nor a regulatory expert. (RX6001 (Deverka Trial Dep. at 126)). Dr. Deverka has never worked at the FDA, Centers for Medicare and Medicaid Services, or at the United States Preventive Services Task Force ("USPSTF"). (RX6001 (Deverka Trial Dep. at 126)).

Third, this Court ordered that "[w]hen citing to exhibits, the parties shall identify the document by the PX or RX number, followed by the name of the entity that produced the document, and the page number." Order on Post-Trial Findings at 3. The FDA did not "produce" RX3326 or RX3416; the proposed finding is misleading to the extent that it implies direct production by the FDA in connection with this proceeding. Even setting that issue aside, RX3326 and RX3416 are not the actual sources of the material contained in Respondents' chart. [redacted] In the absence of specific citations for specific factual propositions, Respondents' proposed finding should be disregarded as improper and unsupported.

189. A company seeking FDA approval for an in-vitro diagnostic (IVD)—i.e., a test of human tissue or blood samples that is performed outside the body—for any test of a life threatening disease, such as cancer, would need premarket approval. (RX3867 (Deverka Expert Report) ¶ 35.)

Response to Finding No. 189

[redacted]

[redacted]

190. Galleri would be classified as a Class III device requiring premarket approval before it could be commercialized as an FDA-approved test. (Febbo (Illumina) Tr. 4445.)

Response to Finding No. 190

Complaint Counsel does not disagree with the proposed finding.

191. Premarket approval (PMA) is the "most stringent type of device application required by FDA." (RX3585 (FDA Approval) at 10.) It often requires significant preparation and voluminous amounts of data, including in-depth review of the technical features of a device and extensive data from clinical trials to demonstrate the efficacy and safety of the device. (RX3867 (Deverka Expert Report) ¶ 35.)

Response to Finding No. 191

The proposed finding is improper, vague, unreliable, and misleading. Complaint Counsel objects to Respondents' misattribution of RX3585 to suggest that it was produced by the FDA, in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3 ("When citing to exhibits, the parties shall identify the document by the PX or RX number, followed by the name of the entity that produced the document."). The document was not produced by the FDA. Rather, Respondents themselves appear simply to have printed out a page from "drugwatch.com." The document itself constitutes unreliable hearsay. It is an untested statement from a random internet site. Given the inherent unreliable nature of the document, it lacks probative value (*see* Rule 4.43(b)). This court should disregard RX3585. Moreover, Respondents' misattribution of the document to suggest that it was produced by the FDA is itself misleading.

[redacted]

[redacted]

Even if the proposed finding were considered opinion-based, Dr. Deverka is not qualified to provide expert opinion testimony about the FDA's regulatory process. Dr. Deverka testified during her trial deposition that she is neither an FDA expert nor a regulatory expert. (RX6001 (Deverka Trial Dep. at 126)). This Court should not accord Dr. Deverka's opinion any weight and should disregard the proposed finding.

192. PMA submissions not only take significant time, investment and resources to prepare, but they also take time for the FDA to review. (RX3867 (Deverka Expert Report) ¶ 35.) PMA submission requires a rigorous evidence review. (RX3569 (FDA) at 1; RX3867 (Deverka Expert Report) ¶ 35.)

Response to Finding No. 192

While the term "significant" is vague and ambiguous, Complaint Counsel does not disagree that the PMA submissions require time, investment, and resources to prepare. And while the term "rigorous" is vague and ambiguous, Complaint Counsel does not disagree that PMA approval exceeds the requirements to sell a device as an LDT. (*See* CCFF ¶¶ 506-535).

Beyond those specific points, the Court should disregard the proposed finding.

Complaint Counsel notes that the proposed finding relies on improper expert opinion.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Deverka as the only source of evidence supporting the fact that PMA approval often requires significant preparation and voluminous amounts of data. Even if the proposed finding were considered opinion-based, Dr. Deverka is not qualified to provide expert opinion testimony about the FDA's regulatory process. Dr. Deverka testified during her trial deposition that she is neither an FDA expert nor a regulatory expert. (RX6001 (Deverka Trial Dep. at 126)). This Court should not accord Dr. Deverka's opinion weight.

The second sentence of the proposed finding cites to RX3569. RX3569 does not specifically state anywhere that "PMA submission requires a rigorous evidence review." [redacted] But, as noted above, Dr. Deverka is not qualified to speak to the requirements of PMA submission as either a fact or expert witness. The Court should not accord Dr. Deverka's opinion any weight.

Finally, Complaint Counsel notes that the FDA did not "produce" RX3006; the proposed finding is misleading to the extent that implies direct production by the FDA in connection with this proceeding.

E. Market Access: Key Factors and Stakeholders

193. The commercial availability of a novel medical device, however promising, will not result in broad patient access without reimbursement by payors and adoption by stakeholders. (RX6001 (Deverka Trial Dep. at 30–31); RX3867 (Deverka Expert Report) ¶ 29.) Test manufacturers must engage in a multi-pronged campaign to obtain reimbursement of a new test before it can obtain widespread adoption. (RX6001 (Deverka Trial Dep. at 30–31); RX3867 (Deverka Expert Report) ¶ 29.)

Response to Finding No. 193

The proposed finding is vague because the terms "stakeholders," "multi-pronged," are

ambiguous. Complaint Counsel does not disagree that obtaining coverage from Medicare and private insurers is important to achieve broad patient access for MCED tests. (*See* CCFF ¶¶ 552-563).

194. Test manufacturers must take into account a range of considerations when bringing a new test to market, including reimbursement by payors, development of clinical evidence, obtaining regulatory approvals, and adoption by relevant stakeholders. (RX6001 (Deverka Trial Dep. at 31–32, 33–34); RX3867 (Deverka Expert Report) ¶ 30.)

Response to Finding No. 194

The proposed finding is vague because the terms "range of considerations," "bringing . . . to market," and "relevant stakeholders" are ambiguous. Therefore, this Court should disregard the proposed finding.

195. The table below provides an overview of each factor, which is described in more detail below. (RX6001 (Deverka Trial Dep. at 31–32, 33–34); RX3867 (Deverka Expert Report) ¶ 30.)

Table 2

Factor	**Key Components**
Evidence	Analytical Validity Evidence
Development	Clinical Validity Evidence
	Clinical Utility Evidence
	Health Economic Evidence
	Engagement with Payors
Regulatory	Approval or Clearance by the FDA or Appropriate Regulatory Framework
Adoption	Physician Education Campaigns
	Engagement with Medical Specialty Societies and Patient Advocacy Groups
	Incorporation of Technology into Specialty Society Guidelines
	Engagement with Health Technology Assessment (HTA) and Advisory Groups that Provide Treatment Recommendations
Reimbursement	Coverage
	Coding & Payment Assignment
	Payment & Contracting

Response to Finding No. 195

The proposed finding is vague and confusing. It is vague because the term "each factor" is undefined and provided without context. The table itself is vague and confusing because the terms "factor" and "key components" are undefined and provided without context. Respondents have simply copy-pasted a table from Dr. Deverka's report into their findings. It is unclear what specific finding or factual proposition is even being offered. Therefore, this Court should disregard the proposed finding.

1. **Evidence Development**

196. Public payors—such as Medicare and Medicaid—and private payors consider numerous factors when deciding whether to cover a new test, including evidence of effectiveness, safety, the product's indication, the product's appropriate use population, and cost. In particular, the following types of evidence are considered:

Response to Finding No. 196

The proposed finding is unsupported because no evidence is cited for the statement that public and private payors consider numerous factors when deciding whether to cover a new test, including evidence of effectiveness, safety, the product's indication, the product's appropriate use population, and cost. The Court should disregard the proposed finding.

Additionally, the proposed finding is vague because the terms "product indication" and "appropriate use population" are undefined.

196.1 Analytic Validity. How well the test predicts the presence or absence of a particular biomarker. (RX6001 (Deverka Trial Dep. at 33–34); RX3867 (Deverka Expert Report) ¶ 31.)

Response to Finding No. 196.1

The proposed finding is vague and confusing because it is not a complete sentence, and it is unclear what factual statement is being proffered. To the extent that Respondents are offering a definition, this Court ordered that experts shall not be cited to "support factual propositions that

should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Deverka as the only source of evidence supporting the definition of analytic validity. [redacted] This Court should disregard this evidence and the proposed finding.

196.2 Clinical Validity. How well an analyzed biomarker is related to the presence, absence, or risk of a specific disease. (RX6001 (Deverka Trial Dep. at 33–34); RX3867 (Deverka Expert Report) ¶ 31.)

Response to Finding No. 196.2

The proposed finding is vague and confusing because it is not a complete sentence, and it is unclear what factual statement is being proffered. To the extent that Respondents are offering a definition, this Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Deverka as the only source of evidence supporting the definition of clinical validity. [redacted] This Court should disregard this evidence and the proposed finding.

196.3 Clinical Utility. The ability of a screening or diagnostic test to prevent or ameliorate adverse health outcomes (e.g., mortality, morbidity, or disability) by enabling the clinician to identify and adopt appropriate treatments or to otherwise alter clinical care decisions that lead to improved health outcomes, while also accounting for the harms of testing. (RX6001 (Deverka Trial Dep. at 34); RX3867 (Deverka Expert Report) ¶ 31.)

Response to Finding No. 196.3

The proposed finding is vague and confusing because it is not a complete sentence, and it is unclear what factual statement is being proffered. To the extent that Respondents are offering

a definition, this Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Deverka as the only source of evidence supporting the definition of clinical utility. [redacted] This Court should disregard this evidence and the proposed finding.

196.4 Health Economic Evidence. The budgetary impact or cost-effectiveness of adopting or covering a new test on a health plan or the health care system at large. (RX6001 (Deverka Trial Dep. at 34–35); RX3867 (Deverka Expert Report) ¶ 31.)

Response to Finding No. 196.4

The proposed finding is vague and confusing because it is not a complete sentence, and it is unclear what factual statement is being proffered. To the extent that Respondents are offering a definition, this Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Deverka as the only source of evidence supporting the definition of health economic evidence. [redacted] This Court should disregard this evidence and the proposed finding.

197. Generating this evidence is a costly and time-intensive endeavor, often requiring extensive clinical trials to get the amount and quality of data to satisfy public and private payors. (RX3867 (Deverka Expert Report) ¶ 31.)

Response to Finding No. 197

The proposed finding is vague, confusing, and speculative. The proposed finding is vague because the terms "generating," "this evidence," "costly," "time-intensive," "often,"

"extensive," "amount and quality of data" and "satisfy" are undefined and provided without context. Generating any evidence requires both cost and time. For support, Respondents cite only to the paid testimony of Dr. Deverka. Indeed, the proposed finding is merely a sentence from Dr. Deverka's report that Respondents have copy-pasted into their own findings. Dr. Deverka lacks foundation. Dr. Deverka testified during her trial deposition that the only expertise she identifies in her report is as a "health services and policy researcher." (RX6001 (Deverka Trial Dep. at 125)). Therefore, this Court should disregard the proposed finding.

2. **Regulatory**

198. Payors will also consider the regulatory status of a new test. Payors may be more apt to cover a test that is perceived to have undergone a more rigorous review process, and therefore may cover an FDA approved test more readily than an LDT, with a FDA-cleared test treated as an intermediate preference between the two. [redacted]; PX7090 (Sood (Guardant) Dep. at 124); PX7077 (Chahine (Helio) Dep. at 41–42); PX7116 (Dolan (Quest) Dep. at 66); RX3867 (Deverka Expert Report) ¶ 36.)

Response to Finding No. 198

Complaint Counsel has no specific response to this proposed finding.

199. Medicare is currently statutorily prohibited from covering most preventive services including cancer screening tests, unless carved out as a legislative exemption, which may be influenced based on regulatory status. (RX3646 (Social Security Act § 1833, 42 U.S.C. § 1395I).) Private payors are not prohibited from covering LDTs, however, payors may prefer to cover a screening test that is FDA approved. (RX3867, (Deverka Expert Report) ¶ 36.)

Response to Finding No. 199

The proposed finding is vague and improper. Respondents' finding is vague because the terms "preventative services," "carved out," "may be influenced," "regulatory states," "cover," and "may prefer" are undefined and ambiguous. Respondents' citation to RX3646 for the first sentence of the finding is in contravention of this Court's Order regarding post-trial findings. This Court ordered that "[w]hen citing to exhibits, the parties shall identify the document by the PX or RX number, followed by the name of the entity that produced the document, and the page

number." (Order on Post-Trial Findings at 3). RX1605 is a 48-page document. Respondents fail to provide a citation to a specific page number (or to any specific subsection of the Social Security Act) in contravention of the Court's Order. It is not this Court's job to dig through 48 pages of the Social Security Act to discern what support, if any, is provided for Respondents' claim. The Court should disregard this proposed evidence. Complaint Counsel does not disagree that private payors are not prohibited from paying for LDTs. Although the term "may prefer" is ambiguous, Complaint Counsel does not disagree that [redacted]

[redacted]

3. **Adoption**

200. In addition to public and private payors, a number of other stakeholders influence the availability of novel medical tests and any MCED test developer must attempt to engage these stakeholders to communicate the value of their test, including health technology assessment (HTA) and advisory bodies, patient advocacy groups, and medical specialty societies. (RX3005 (Deloitte); RX3867 (Deverka Expert Report) ¶ 37.)

Response to Finding No. 200

The proposed finding is vague because the terms "stakeholders," "communicate the value," "influence," "engage," "health technology assessment (HTA) and advisory bodies," "patient advocacy groups," and "medical specialty societies" are undefined. Therefore, this Court should disregard the proposed finding.

201. Each of these stakeholders plays an integral role in shaping treatment pathways and innovation in oncology, thereby influencing coverage in addition to utilization of oncology tests and treatments. (RX3867 (Deverka Expert Report) ¶ 37.)

Response to Finding No. 201

The entire proposed finding is vague. The proposed finding is vague because it does not specify who "these stakeholders" refers to, and the terms "integral role," "shaping," "treatment pathways and innovation," and "influencing," are ambiguous. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or

documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite [redacted] This Court should disregard this evidence and the proposed finding.

202. Health Technology Assessment (HTA) and Advisory Bodies. HTAs evaluate the benefits and shortcomings of medical products, including cost, value and expected clinical outcomes, to provide recommendations regarding coverage and adoption of these products. (RX6001 (Deverka Trial Dep. at 43–44); RX3867 (Deverka Expert Report) ¶ 38.)

Response to Finding No. 202

The proposed finding is vague and relies on improper expert opinion. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite [redacted] This Court should disregard this evidence. The proposed finding is vague because, notwithstanding the purported definition, it is unclear what specific organization or organizations are being referred to as HTAs and what specific role (official or otherwise), if any, they are alleged to have in coverage and adoption decisions. Therefore, this Court should disregard the proposed finding.

202.1 Recommendations from HTA bodies may either increase or decrease access to a new test, depending on the final recommendation and indications/populations that HTAs conclude are most appropriate for a new technology. (RX6001 (Deverka Trial Dep. at 43–44); RX3867 (Deverka Expert Report) ¶ 38.)

Response to Finding No. 202.1

The proposed finding is vague because the term "HTA bodies" is undefined; it is unclear what specific organization or organizations are being referred to as "HTA bodies" and what specific role (official or otherwise), if any, they are alleged to have in coverage and adoption decisions. Similarly, the term "may either increase or decrease access" is ambiguous. Therefore, this Court should disregard the proposed finding.

> 202.2 Among the most influential HTA organizations is the USPSTF, which influences coverage and adoption of medical services through a review system that ultimately assigns a letter grade to the reviewed service, indicating positive or negative support. (RX3867 (Deverka Expert Report) ¶ 39.)

Response to Finding No. 202.2

Complaint Counsel does not disagree that USPSTF is a guideline group that assigns letter ratings to products. [redacted] Beyond that, the proposed finding is vague because the term "[a]mong the most influential HTA organizations" is undefined and it is unclear what entities are intended to be included within the definition "HTA organizations." [redacted]

[redacted]

Additionally, the proposed finding is vague because the terms "most influential" and "influences" are ambiguous. With the exception of the specific points noted above with which Complaint Counsel does not disagree, this Court should disregard the proposed finding.

> 202.3 USPSTF recommendations also impact whether a screening test can be covered by Medicare, where Medicare has statutory authority to cover only preventive tests with a USPSTF A or B rating. (RX3646 (Social Security Act § 1833, 42 U.S.C. § 1395I); RX6001 (Deverka Trial Dep. at 50); RX3867 (Deverka Expert Report) ¶ 39.)

Response to Finding No. 202.3

Complaint Counsel does not disagree that USPSTF recommendations can affect Medicare coverage decisions. Complaint Counsel also does not disagree that the Medicare Act allows and provides for Medicare to pay for certain services if they are ranked as an A- of B-rated service by USPSTF.

203. Medical Specialty Societies. Test manufacturers must engage with specialty societies to communicate the clinical validity and utility of a new test to physicians and pathologists. (RX3867 (Deverka Expert Report) ¶ 40.)

Response to Finding No. 203

The proposed finding is improper and vague. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, [redacted]; *see* Order on Post-Trial Findings at 3). And, moreover, [redacted] Respondents improperly rely on Dr. Deverka's expert

opinions to support this proposed finding, in contravention of this Court's Order, and otherwise have never provided any evidence to support this proposed finding, either here or in Dr. Deverka's report, and therefore this Court should disregard Respondents' proposed finding.

The proposed finding is vague because the terms "specialty societies," clinical validity," and "pathologists" are undefined. Additionally, the term "engage with" is ambiguous and unclear.

> 203.1 Medical specialty societies such as the American Medical Association (AMA), the National Comprehensive Cancer Network (NCCN), American Society of Clinical Oncology (ASCO®), and American Clinical Laboratory Association (ACLA), provide a range of services for their members, including providing practice support, participating in relevant lobbying efforts, and considering the role of new technologies in existing care paradigms. (RX3867 (Deverka Expert Report) ¶ 40.)

Response to Finding No. 203.1

The proposed finding is improper and vague. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3).

The proposed finding is vague because the term "medical specialty societies" is

undefined and the terms "providing practice support" and "considering the role of new technologies" are ambiguous. Additionally, it is not clear who the members of specialty societies are.

203.2 Specialty societies such as NCCN and ASCO® develop guidelines that provide screening, diagnostic workup and treatment recommendations based on comprehensive literature reviews. (RX6001 (Deverka Trial Dep. at 44–45); RX3867 (Deverka Expert Report) ¶ 40.)

Response to Finding No. 203.2

The proposed finding is improper and vague. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

The proposed finding is vague because the terms "specialty societies" and "diagnostic workup" are undefined. Additionally, the proposed finding does not specify what literature the specialty society guidelines are based on.

203.3 For instance, NCCN most recently updated its guidelines in 2021 that detail recommended screening paradigms, including frequency and modalities, for lung

cancer and breast cancer, called the "Lung Cancer Screening" and "Breast Cancer Screening and Diagnosis" guidelines, respectively. (RX3867 (Deverka Expert Report) ¶ 40.) Such guidelines heavily influence testing and treatment decisions across U.S. physician practices. (RX3867 (Deverka Expert Report) ¶ 40.)

Response to Finding No. 203.3

The proposed finding is improper and vague. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

The proposed finding is vague because the opening phrase "for instance" is provided without context. Additionally, the term "heavily influence" is ambiguous and vague.

203.4 Particularly for new technologies such as MCED screening, physicians may be unaware of test indications, appropriate populations for testing, and how to interpret test results. (RX3867 (Deverka Expert Report) ¶ 40.)

Response to Finding No. 203.4

The proposed finding is vague because the terms "test indications," "appropriate

populations", and "interpret" are undefined. Therefore, this Court should disregard the proposed finding.

> 203.5 Without engagement of these specialty societies, new technologies may go unused despite a positive reimbursement environment. (RX3516 (Bevers et al., NCCN Breast Cancer Screening and Diagnosis); RX6001 (Deverka Trial Dep. at 44–45); RX3518 (Wood, et al., NCCN Lung Cancer Screening); RX3867 (Deverka Expert Report) ¶ 40.)

Response to Finding No. 203.5

The proposed finding is improper and vague. Additionally, Respondents' citations to RX3516 and RX3518 are in contravention of this Court's Order regarding post-trial findings. This Court ordered that "[w]hen citing to exhibits, the parties shall identify the document by the PX or RX number, followed by the name of the entity that produced the document, and the page number." (Order on Post-Trial Findings at 3). RX3516 and RX3518 are a multi-page documents; Respondents fail to provide a citation to any specific page number or page range in contravention of the Court's Order. The Court should disregard this proposed evidence.

Moreover, it is unclear how RX3516 and RX3518 support the proposition of this proposed finding of fact. RX3516 and RX3518 are NCCN Breast Cancer and Lung Cancer Screening and Diagnosis Guidelines, respectively. Neither document supports the statement that "without engagement from these specialty societies, new technologies may go unused despite a positive reimbursement environment." These documents are simply guidelines.

The proposed finding is vague because the terms "these specialty societies" and "positive reinforcement environment" are ambiguous and undefined. Additionally, it is not clear who is engaging with these specialty societies, what this engagement looks like, how often and when this engagement might happen, or what the goal of this engagement is. Therefore, this Court should disregard the proposed finding.

204. Patient Advocacy Groups. Patient advocacy groups drive initiatives and promote policy agendas that improve patient outcomes. (RX3867 (Deverka Expert Report) ¶ 42.)

Response to Finding No. 204

The proposed finding is vague because the term "patient advocacy groups" is undefined. The terms "drive initiatives" and "promote policy agendas" are also overly broad and ambiguous. Therefore, this Court should disregard the proposed finding.

> 204.1 Advocacy groups are often focused on the treatment and detection of select disease areas, such as oncology. (RX3867 (Deverka Expert Report) ¶ 42.) An oncology advocacy group generally focuses on the treatment and detection of select tumor types. (RX3867 (Deverka Expert Report) ¶ 42.)

Response to Finding No. 204.1

The proposed finding is vague because the term "advocacy groups" is undefined and the term "generally focuses on" is ambiguous. Therefore, this Court should disregard the proposed finding.

> 204.2 For instance, advocacy groups may drive education regarding the use of MCED screening for select tumor types, including how MCED screening fits into the standard treatment paradigm for that cancer, the risks and rewards of MCED screening for that cancer, and how family history or other risk factors may influence the benefit of MCED screening. (RX6001 (Deverka Trial Dep. at 45–46); RX3867 (Deverka Expert Report) ¶ 42.)

Response to Finding No. 204.2

The proposed finding is vague because the opening phrase "for instance" provided without context, and the term "advocacy groups" is undefined. Therefore, this Court should disregard the proposed finding.

> 204.3 This is particularly important because while MCED tests screen across many cancer types at once, the patient needs, risks, and existing treatment options across cancers differ. (RX3534 (Putcha G., One Size Does Not Fit All); RX6001 (Deverka Trial Dep. at 45–46); RX3867 (Deverka Expert Report) ¶ 42.)

Response to Finding No. 204.3

The proposed finding is vague and confusing and represents improper expert opinion.

The proposed finding is vague and confusing term "this" is undefined and provided without context. The citation to RX3534 is incomplete and fails to properly identify the source. Moreover, RX3534 is a multi-page document; to the extent Respondents purport to cite RX3534 as the source of the proposed finding, they fail to provide a citation to any specific page number or page range. This Court ordered that "[w]hen citing to exhibits, the parties shall identify the document by the PX or RX number, followed by the name of the entity that produced the document, and the page number." Order on Post-Trial Findings at 3. Respondents' citation to RX3534 violates the Court's Order and the Court should disregard this proposed evidence. Moreover, this is not a properly constructed finding of fact, but rather a sentence Respondents simply copy-pasted from Dr. Deverka's report. The finding is misleading as to source; it obscures this origin by failing to quote Dr. Deverka and by purporting to cite RX3534 as the primary source of the specific language proposed. To the extent that Respondents cite Dr. Deverka, [redacted] Therefore, this Court should disregard the proposed finding.

4. **Reimbursement**

205. Payor reimbursement is a complex, multi-step effort. Coverage defines the range and extent of services and products for which an insurer will pay. Coding is the language that characterizes services, procedures and products rendered to patients, and insurers rely on that coding to define which products and services will or will not be reimbursed.

Response to Finding No. 205

The proposed finding is unsupported by any evidence and should be disregarded. It is also vague to the extent that the term "complex, multi-step effort" is ambiguous.

206. Payment is the amount and process by which reimbursement is made by an insurer for a covered service and/or technology which may involve development of contracts and associated contracted rates between payor and manufacturer. In addition to each of these components of reimbursement, manufacturers must also secure appropriate regulatory

authorization dependent on the type of product. (RX6001 (Deverka Trial Dep. at 47–48); RX3867 (Deverka Expert Report) ¶ 43.)

Response to Finding No. 206

The proposed finding is improper and vague. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

The proposed finding is vague because the terms "development of contracts" and "associated contracted rates" are ambiguous and undefined. Additionally, it is not clear what "appropriate regulatory authorization" is or how it might be secured by manufacturers.

a. Medicare and Medicaid

(i) Development of Coverage Determinations

207. Positive Medicare coverage is critical for cancer screening test developers to ensure accessibility of tests among individuals who are most at risk. (RX6001 (Deverka Trial Dep. at 48.) Medicare is generally available for individuals 65 or older as well as certain younger people with disabilities. (RX3742 (Who is Eligible for Medicare?) at 1.) Based on the common age ranges in which new cancer cases are identified, Medicare coverage will be critical

for widespread access to MCED screening. (RX6001 (Deverka Trial Dep. at 48); RX3867 (Deverka Expert Report) ¶ 44.)

Response to Finding No. 207

The proposed finding is vague because the term "positive Medicare coverage" is undefined and the phrase "will be critical" is ambiguous. Additionally, the proposed finding does not identify the "individuals who are most at risk" and does not specify the "common age ranges in which new cancer cases are identified." Therefore, this Court should disregard the proposed finding.

208. SEER data from 2014–2018 indicates that cancer of any site is most frequently diagnosed in individuals aged 65–74, with a median age of 66. (RX3091 (NCI) at 1). The data show that 28.7% of newly diagnosed cancer cases during this time period occurred in individuals aged 65–74, while 24.3% occurred in individuals aged 55–64, aligning with the population for which Galleri is currently recommended (ages 50+). (RX3091 (NCI) at 1; RX6001 (Deverka Trial Dep. at 48); RX3867 (Deverka Expert Report) ¶ 44.)

Response to Finding No. 208

The proposed finding is improper, unsupported, and vague. RX3091, which was pulled from the National Cancer Institute website, provides no support for the proposed finding. RX3091 includes statistics on the risk and prevalence of cancer in the US and specifically tracks the rate of new cases, the death rate, and the 5-year relative survival rate for cancer of any cancer site. However, RX3091 does not include any information on the age ranges of newly diagnosed cancer patients.

[redacted]

[redacted]

The proposed finding is vague because the term "SEER data" is undefined.

209. Medicare's coverage policies are developed in one of two formats: National Coverage Determinations (NCDs) are policies that determine coverage for all Medicare patients nationally, while Local Coverage Determinations (LCDs) are regionally developed policies by Medicare Administrative Contractors (MACs) that specify coverage specific to that MAC's jurisdiction, in the absence of an NCD. (RX3453 (CMS) at 1; RX6001 (Deverka Trial Dep. at 48–49).)

Response to Finding No. 209

The proposed finding is misleading because Respondents fail to identify [redacted]

[redacted] Therefore, this Court should disregard the proposed finding.

210. When determining coverage for their Medicare Advantage plans, private payors must cover all services with a positive coverage determination across NCDs, and across LCDs within that plan's region. (RX3867 (Deverka Expert Report) ¶ 45.)

Response to Finding No. 210

The proposed finding is improper and vague. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

[redacted]

The proposed finding is vague because the term "Medicare Advantage Plans" is undefined.

211. Pertinent to MCED tests, under § 1862(a)(1)(A) of the SSA, Medicare does not cover experimental or investigational items and services, except in cases of "research conducted pursuant to [Agency for Healthcare Research and Quality (AHRQ) authority]". (RX3648 (Social Security Act § 1862 [42 U.S.C. 1395y]).) § 1142(a)(1) indicates that AHRQ has the authority to "support research with respect to the outcomes, effectiveness, and appropriateness of healthcare services." (RX3645 (Social Security Act § 1142 [42 U.S.C. 1320b–12]).)

Response to Finding No. 211

The proposed finding is misleading and vague. Respondents' failure to identify [redacted]

The proposed finding is vague because it does not explain why the quoted sections of Social Security Act are "pertinent to MCED tests." Additionally, the term "Agency for Healthcare Research and Quality (AHRQ) authority" is undefined. Therefore, this Court should disregard the proposed finding.

211.1 In 2006, Medicare released its initial guidance for the Coverage with Evidence Development (CED) program, which outlined scenarios for limited coverage of experimental and investigational products and services relating to clinical studies, under the statutory basis of § 1862(a)(1)(A) and § 1142(a)(1). (RX3454 (CMS) at 1.)

Response to Finding No. 211.1

The proposed finding is misleading and vague. Respondents' failure to identify [redacted]

The proposed finding is vague because the terms "limited coverage" and "experimental and investigational products and services relating to clinical studies" are ambiguous. Therefore, this Court should disregard the proposed finding.

> 211.2 CMS finalized the CED policy in 2006 to generate data on the utilization and impact of the item or service evaluated in an NCD so that CMS can: document the appropriateness of use of that item or service in Medicare beneficiaries under current coverage; consider future changes in coverage for the item or service; and generate clinical information that will improve the evidence base on which providers base their recommendations to Medicare beneficiaries regarding the item or service. (RX3454 (CMS) at 1–2; RX3867 (Deverka Expert Report) ¶ 46.)

Response to Finding No. 211.2

The proposed finding is vague because the terms "appropriateness of use," "future changes," "clinical information," and "evidence base" are undefined or ambiguous. Therefore, this Court should disregard the proposed finding.

212. CMS's initial 2006 guidance outlined two arms of the CED program: 1) Coverage with Appropriateness Determination (CAD), which refers to coverage conditioned on specific additional data collection, and 2) Coverage with Study Participation (CSP), which refers to coverage conditioned on care being delivered in a setting with a pre-specified data collection process and additional protections in place, such as those present in some research studies.' (RX3454 (CMS) at 1; RX3867 (Deverka Expert Report) ¶ 47.)

Response to Finding No. 212

Complaint Counsel has no specific response to the proposed finding.

213. While CMS has since removed use of these terms, scenarios outlined by the previous terminology remain appropriate uses of CED. Instead of outlining CED options as falling under CAD or CSP, present CED guidance generally details requirements of CED studies to ensure that such studies are considered to be AHRQ-supported. (RX3867 (Deverka Expert Report) ¶ 47, n.73; RX3454 (CMS).)

Response to Finding No. 213

The proposed finding is improper and vague. Respondents' citation to RX3454 is in contravention of this Court's Order regarding post-trial findings. This Court ordered that "[w]hen citing to exhibits, the parties shall identify the document by the PX or RX number,

followed by the name of the entity that produced the document, and the page number." (Order on Post-Trial Findings at 3). RX3454 is a multi-page document; Respondents fail to provide a citation to any specific page number or page range in contravention of the Court's Order. The Court should disregard this proposed evidence.

The only other source that Respondents cite for the proposed finding is Dr. Deverka's report. Thus, the proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is [redacted]; *see* Order on Post-Trial Findings at 3). Respondents improperly rely on Dr. Deverka's expert opinions to support this proposed finding, in contravention of this Court's Order, and therefore this Court should disregard Respondents' proposed finding.

The proposed finding is vague because the term "AHRQ-supported" is undefined and the phrase "generally details" is ambiguous.

214. While the CED program offers alternative coverage options for manufacturers without a clear coverage pathway through the standard LCD/NCD process, coverage is limited in scope and contingent on completion of an AHRQ-supported clinical study. As a result, CED-based coverage bears additional data reporting burdens and setting restrictions, while still requiring development of a formal coverage determination. (RX3867 (Deverka Expert Report) ¶ 48.)

Response to Finding No. 214

The proposed finding is improper and vague. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is [redacted]

[redacted]; *see* Order on Post-Trial Findings at 3). And, moreover, [redacted] Respondents improperly rely on Dr. Deverka's expert opinions to support this proposed finding, in contravention of this Court's Order, and otherwise have never provided any evidence to support this proposed finding, either here or in Dr. Deverka's report, and therefore this Court should disregard Respondents' proposed finding.

The proposed finding is vague because the terms "AHRQ-supported clinical study" and "formal coverage determination" are undefined. Additionally, the proposed finding does not specify what "alternative coverage options" exist for manufacturers without a clear coverage pathway through the standard LCD/NCD process, and it does not specify the "additional data reporting burdens and setting restrictions" required for CED-based coverage.

215. While Medicare covers individuals aged 65 and older, private payor or Medicaid coverage must be achieved to ensure coverage for those under 64 years old. (RX6001 (Deverka Trial Dep. at 55–56).)

Response to Finding No. 215

The proposed finding is improper, misleading, unsupported, and vague. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is [redacted], and Respondents cite only to Dr. Deverka's trial deposition for support, in contravention of this Court's Order. [redacted]; *see* Order on Post-Trial Findings at 3). Respondents improperly rely on Dr. Deverka's expert opinions to support this proposed finding, in contravention of this Court's Order, and otherwise have never provided any evidence to

support this proposed finding, either here or [redacted], and therefore this Court should disregard Respondents' proposed finding.

The proposed finding is misleading because Respondents fail to identify [redacted].

The proposed finding is unsupported because [redacted] Furthermore, the cited deposition testimony does not reference Medicare or Medicaid coverage. Dr. Deverka only briefly mentions that individuals starting at age 45 and 50 are mostly covered by private insurers. Finally, the proposed finding is vague because the term "ensure coverage" is ambiguous. For the reasons stated above, this Court should disregard the proposed finding.

216. Because low socioeconomic status is correlated with increased cancer incidence and mortality, it is also critical to provide access to MCED screening for the population likely to be covered by Medicaid. (RX3650 (Singh et al., 2017) at 11.)

Response to Finding No. 216

The proposed finding is misleading, unsupported, and vague. Respondents' failure to identify [redacted]

The proposed finding is unsupported because RX3650 only supports the first half of the proposed finding—the fact that low socioeconomic status is correlated with increased cancer incidence and mortality. RX3650 contains no references to MCED screening or Medicaid, and thus does not support the second half of the proposed finding.

The proposed finding is vague because the terms "is correlated with," "provide access," and "population likely to be covered by Medicaid" are ambiguous. Therefore, this Court should

disregard the proposed finding.

217. While Medicaid programs differ on a state-by-state basis, § 1905 [42 U.S.C. § 1936d] of the Social Security Act (SSA) sets federal minimum coverage requirements that all state Medicaid programs must adhere to. RX3649 (Social Security Act § 1905 [42 U.S.C. § 1396d]); (RX3867 (Deverka Expert Report) at 49.) Other items and services, including oncology tests, are covered on a state-by-state basis, where coverage determinations typically lag behind coverage from Medicare and other private payors. (RX3150 (OLC, Patient Protection and Affordable Care Act); RX3438 (MACPAC, Mandatory and Optional Benefits) at 2–3; (RX3867 (Deverka Expert Report) ¶ 49.)

Response to Finding No. 217

The proposed finding is improper, unsupported, and vague. Respondents' citation to RX3150 is in contravention of this Court's Order regarding post-trial findings. This Court ordered that "[w]hen citing to exhibits, the parties shall identify the document by the PX or RX number, followed by the name of the entity that produced the document, and the page number." (Order on Post-Trial Findings at 3). RX3150 is a 900+ page document; Respondents fail to provide a citation to any specific page number or page range in contravention of the Court's Order. The Court should disregard this proposed evidence.

[redacted] RX3438 merely lists screening and preventive services as an optional Medicaid benefit. It does not specify oncology tests and provides no support for the assertion that Medicaid coverage determinations typically lag behind coverage from Medicare and other private payors. [redacted]

[redacted]

The proposed finding is vague because the phrase "typically lag" is ambiguous.

218. Manufacturers seeking Medicaid reimbursement for services that fall outside of the scope of the program's national coverage mandates will therefore have to understand how coverage determinations are made on a state-by-state program level, and communicate the value of their test to payors and state-managed Medicaid programs as appropriate. (RX3867 (Deverka Expert Report) ¶ 50.)

Response to Finding No. 218

The proposed finding is improper and vague. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is [redacted]; *see* Order on Post-Trial Findings at 3). And, moreover, [redacted] Respondents improperly rely on Dr. Deverka's expert opinions to support this proposed finding, in contravention of this Court's Order, and otherwise have never provided any evidence to support this proposed finding, either here [redacted], and therefore this Court should disregard Respondents' proposed finding.

The proposed finding is vague because the term "as appropriate" is ambiguous.

(ii) Statutory Limitations to Coverage

219. While Medicare coverage is primarily dictated by development of coverage determination policies, coverage is limited by statute and other requirements. (RX6001 (Deverka Trial Dep. at 49–50).) Regulations as set forth by 45 CFR § 156.100 of the ACA require individual and small group market health plans to cover a pre-established list of itemized Essential Health Benefits (EHBs), including preventive and wellness services. (RX3150 (OLC); RX3380 (CMS) at 1.)

Response to Finding No. 219

The proposed finding is improper, misleading, and vague. The first sentence of the proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is [redacted], and Respondents cite only to Dr. Deverka's trial deposition testimony to support the first sentence, in contravention of this Court's Order. [redacted]; *see* Order on Post-Trial Findings at 3). Respondents improperly rely on Dr. Deverka's expert opinions to support this portion of the proposed finding, in contravention of this Court's Order, and otherwise have never provided any evidence, either here [redacted], and therefore this Court should disregard the first sentence of Respondents' proposed finding.

The proposed finding is misleading because Respondents' fail to [redacted]. Additionally, Respondents' citation to RX3150 is misleading and in contravention of this Court's Order regarding post-trial findings. This Court ordered that "[w]hen citing to exhibits, the parties shall identify the document by the PX or RX number, followed by the name of the entity that produced the document, and the page number." (Order on Post-Trial Findings at 3). RX3150 is a 900+ page document; Respondents fail to provide a citation to any specific page number or page range in contravention of the Court's Order. The

Court should disregard this proposed evidence.

The proposed finding is vague because the terms "individual and small group market health plans" and "Essential Health Benefits (EHBs)" are undefined. Therefore, this Court should disregard the proposed finding.

220. As a result, eligible plans are required to cover a number of single-cancer screening tests without cost-sharing, including colorectal cancer screening for adults aged 45–75; lung cancer screening for adults aged 55–80 at high risk for lung cancer due to current or past heavy smoking; breast cancer mammography screenings every 2 years for women over 50; and cervical cancer screenings via pap smear for women aged 21–65. (RX3580 (CMS); RX3581 (HealthCare.gov) at 2–3; RX3867 (Deverka Expert Report) ¶ 51.)

Response to Finding No. 220

The proposed finding is vague. First, the opening phrase "as a result" is provided without context. Second, it is not clear which plans are "eligible" or what these plans are eligible for. Third, the term "cost-sharing" is undefined. Therefore, this Court should disregard the proposed finding.

221. However, due to current statutory restrictions, the Medicare program is restricted from providing coverage to preventive services in the vast majority of situations. RX3150 (OLC, Patient Protection and Affordable Care Act; (RX3867 (Deverka Expert Report) ¶ 52.)

Response to Finding No. 221

The proposed finding is improper and vague. Respondents' citation to RX3150 is in contravention of this Court's Order regarding post-trial findings. This Court ordered that "[w]hen citing to exhibits, the parties shall identify the document by the PX or RX number, followed by the name of the entity that produced the document, and the page number." Order on Post-Trial Findings at 3. RX3150 is a 900+ page document; Respondents fail to provide a citation to any specific page number or page range in contravention of the Court's Order. The Court should disregard this proposed evidence.

The only other source that Respondents cite for the proposed finding is Dr. Deverka's

report. Thus, the proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is [redacted]; *see* Order on Post-Trial Findings at 3). Respondents improperly rely on Dr. Deverka's expert opinions to support this proposed finding, in contravention of this Court's Order, and therefore this Court should disregard Respondents' proposed finding.

The proposed finding is vague because the terms "current statutory restrictions," "preventive services," and "the vast majority of situations" are ambiguous.

222. As such, manufacturers of new preventive services, including cancer screening tests and presumably MCED tests, cannot gain Medicare coverage through standard processes. Instead, MCED tests can only gain Medicare coverage through an exception to these statutory provisions, which will require prolonged and cumbersome coverage efforts. (RX6001 (Deverka Trial Dep. at 50–51); [redacted]

Response to Finding No. 222

The proposed finding is vague, confusing, and represents improper expert opinion lacking in foundation. This is not a properly constructed finding of fact, but rather a sentence Respondents simply copy-pasted from Dr. Deverka's report. The very beginning of the proposed finding – "As such" – clearly references material not contained within the finding itself. The text following this introduction is thus confusing and lacks context. The proposed finding is vague because the terms "[a]s such," "preventative services," "standard processes," "exception," "these statutory provisions," and "prolonged and cumbersome" are undefined and provided without context. Additionally, Respondents rely solely on the paid expert testimony of Dr. Deverka to support what appear to be some fact or facts about Medicare coverage, "standard processes," and "statutory provisions." This Court ordered that experts shall not be cited to "support factual

propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Respondents' citation to Dr. Deverka as the only source of evidence contravenes this Court's Order. This Court should disregard this evidence. Finally, Dr. Deverka lacks foundation. Dr. Deverka testified during her trial deposition that the only expertise she identifies in her report is as a "health services and policy researcher. (RX6001 (Deverka Trial Dep. at 125)). Dr. Deverka testified during her trial deposition that she is neither an FDA expert nor a regulatory expert. (RX6001 (Deverka Trial Dep. at 126)). Dr. Deverka has never worked at the FDA, Centers for Medicare and Medicaid Services, or at the United States Preventive Services Task Force ("USPSTF"). (RX6001 (Deverka Trial Dep. at 126)). Therefore, this Court should disregard the proposed finding.

223. Ultimately, a manufacturer seeking coverage of a new preventive service, such as an MCED test, has only two available pathways to coverage:

Response to Finding No. 223

The proposed finding is unsupported by any evidence and should be disregarded. It is also vague because it does not specify the "only two available pathways to coverage" for a manufacturer seeking coverage of a new preventative service.

224. USPSTF Review with NCD Development. This pathway requires that a test manufacturer seek development of a USPSTF evidence report reviewing the product, followed by development of an NCD from Medicare. Developing a USPSTF evidence report requires an initial topic selection, work plan development, development of a draft recommendation statement, an associated vote, and eventually development and release of a final report—all of which can take significant time. (RX3720 (USPSTF); [redacted]

Response to Finding No. 224

[redacted]

[redacted]

224.1 During the initial topic selection stage, USPSTF reviews nominated topics by considering each topic's public health importance and potential for impact (i.e. controversy, timeliness), with an intent to balance USPSTF's review portfolio across populations, types of services and disease types. USPSTF selects and prioritizes topics for review, and is not required to review all nominated topics. (RX3720 (USPSTF); [redacted]

Response to Finding No. 224.1

[redacted]

[redacted]

224.2 Next, USPSTF indicates that expected timelines from workplan development to draft recommendation vote is 9–15 months, and then an additional 9 months is typically required between the vote to final recommendation release. (RX3720 (USPSTF).)

Response to Finding No. 224.2

The proposed finding is improper, misleading, and vague. Respondents' citation to RX3720 is in contravention of this Court's Order regarding post-trial findings. This Court

ordered that "[w]hen citing to exhibits, the parties shall identify the document by the PX or RX number, followed by the name of the entity that produced the document, and the page number." Order on Post-Trial Findings at 3. RX3720 is a multi-page document; Respondents fail to provide a citation to any specific page number or page range in contravention of the Court's Order. The Court should disregard this proposed evidence.

Respondents' failure to identify [redacted], in contravention of this Court's Order, and therefore this Court should disregard Respondents' proposed finding.

The proposed finding is vague because the terms "expected timelines" and "typically required" are ambiguous.

> 224.3 As such, manufacturers with screening tests who seek Medicare coverage through this pathway should not expect approval for at least 1.5 years from the time they apply, followed by development of an NCD for coverage to be established. (RX3720 (USPSTF).) In practice, the USPSTF pathway often takes far longer because of the time it requires up front during the topic selection stage. (RX6001 (Deverka Trial Dep. at 50–51.)

Response to Finding No. 224.3

The proposed finding is improper, misleading, and vague. Respondents' citation to RX3720 is in contravention of this Court's Order regarding post-trial findings. This Court

ordered that "[w]hen citing to exhibits, the parties shall identify the document by the PX or RX number, followed by the name of the entity that produced the document, and the page number." Order on Post-Trial Findings at 3. RX3720 is a multi-page document; Respondents fail to provide a citation to any specific page number or page range in contravention of the Court's Order.

The only other source that Respondents cite for the proposed finding is Dr. Deverka's trial deposition testimony. Thus, the proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is [redacted] in contravention of this Court's Order, and therefore this Court should disregard Respondents' proposed finding.

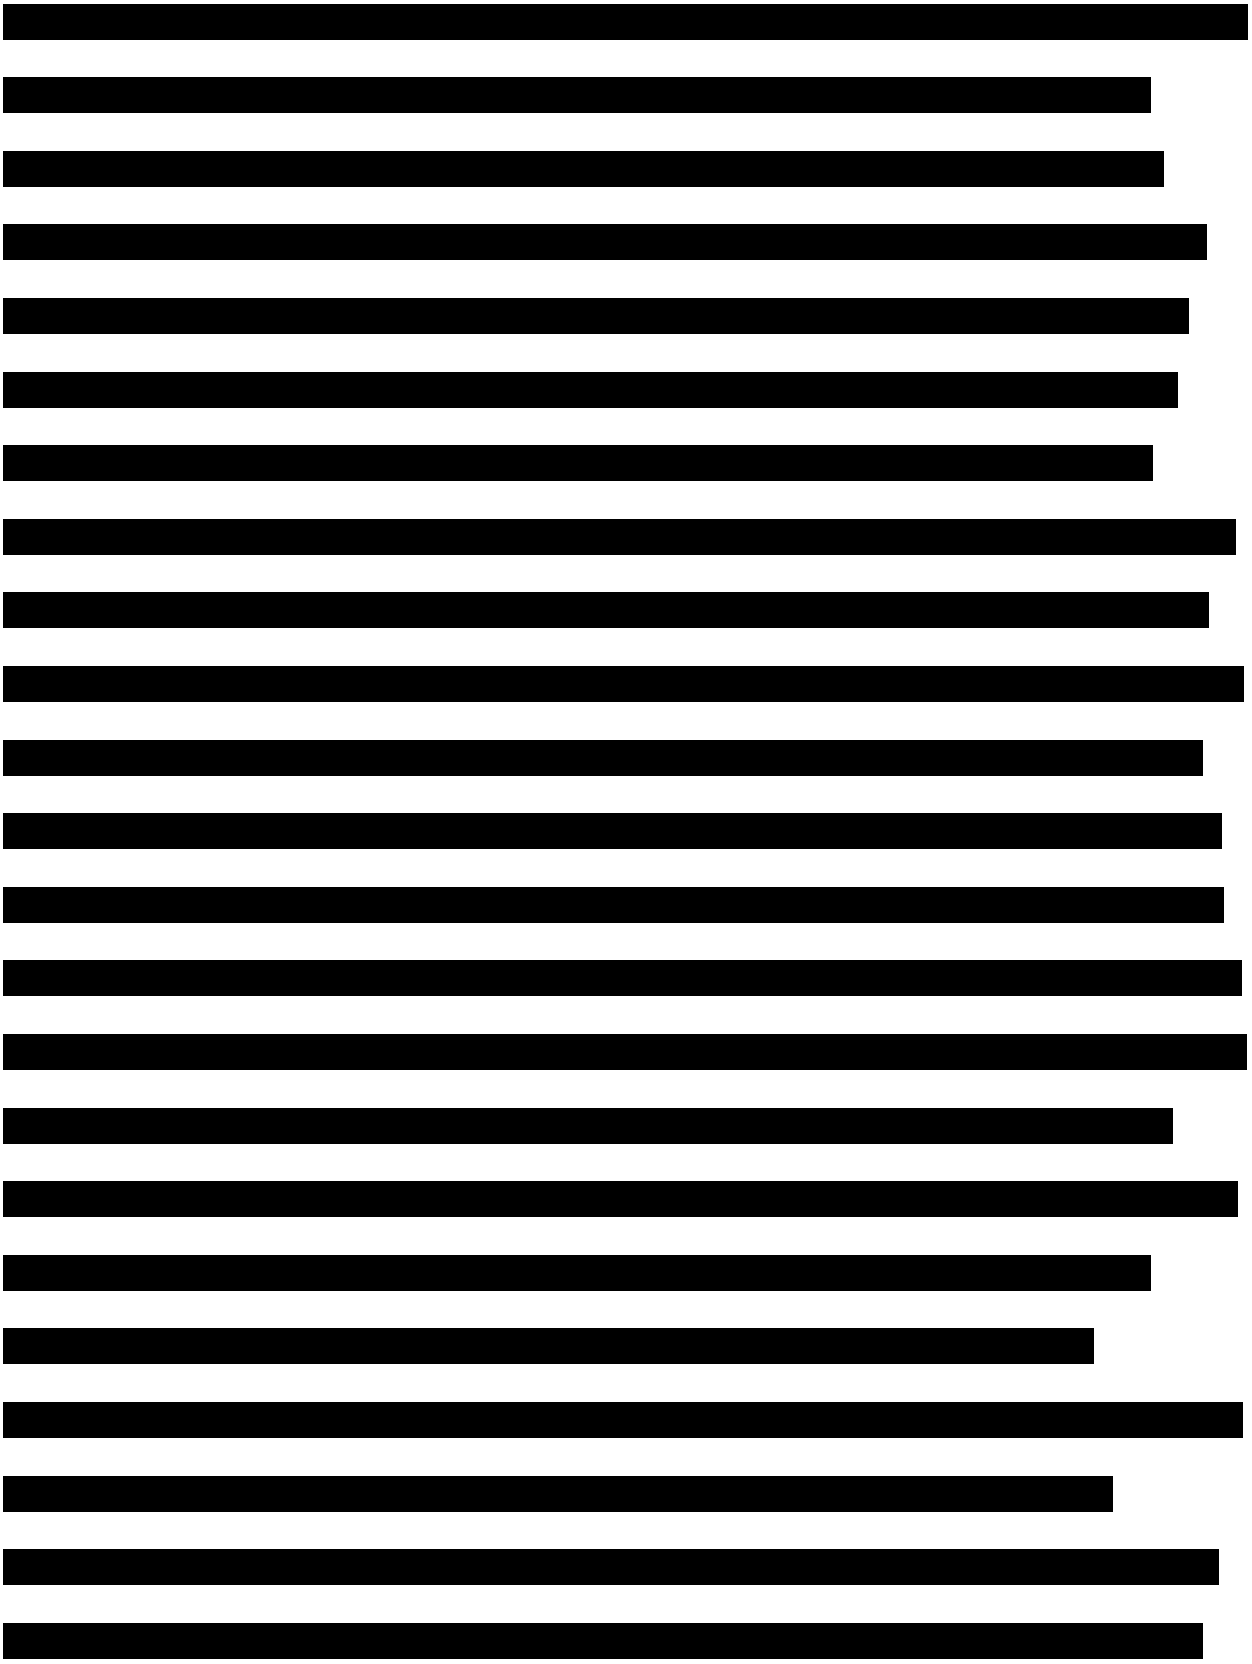
The proposed finding is misleading because Respondents' [redacted]

The proposed finding is vague because the terms "this pathway" and "far longer" are ambiguous. For the reasons stated above, this Court should disregard the proposed finding.

224.4 According to a former USPSTF liaison, it will likely take 5–6 years for the USPSTF to evaluate a novel technology such as MCED tests. (RX3720 (USPSTF); RX1912 (Liquid Biopsy GLG) at 2); [redacted]

Response to Finding No. 224.4

[redacted]



[redacted]

225. Amendment of SSA with LCD/NCD Development. Manufacturers of the MCED test supports passage of Congressional legislation that provides Medicare authorization to cover the test based on a newly developed benefit category. (RX6001 (Deverka Trial Dep. at 49–50, 52); [redacted]

Response to Finding No. 225

[redacted]

225.1 Only a limited number of other preventive services, such as pap smears, mammography, and colon and prostate cancer screening, have successfully used this option. (RX3050 (Balanced Budget Act of 1997 § 4101–04).)

Response to Finding No. 225.1

[redacted]

225.2 Further, coverage for these preventive services is limited to the definition of the service used in the added benefit category. Manufacturers interested in using this pathway to gain coverage would require approval of a bill that amends § 1861 and § 1862 of the SSA, followed by development of a Medicare LCD or NCD.' (RX3647 (Social Security Act § 1861 [42 U.S.C. 1395x] at Part E- Miscellaneous Provisions); RX3648 (Social Security Act § 1862 [42 U.S.C. 1395y] at Exclusions from Coverage and Medicare as a Secondary Payor); [redacted]

Response to Finding No. 225.2

[redacted]

225.3 One such bill, the Multi-Cancer Early Detection Screening Coverage Act (H.R. 1946), was re-introduced by Representative Terri Sewell (D-AL) on March 16, 2021 following its initial introduction as H.R. 8845 during the 116th Congressional session in 2020.' (PX0095 (H.R. 8845); RX3602 (H.R. 1946); [redacted]

Response to Finding No. 225.3

[redacted]

225.4 The bill would add MCED tests as a Medicare benefit category, where a MCED test is defined as an FDA approved/cleared test for early detection across many

cancer types, that is either of the following: 1) A genomic sequencing blood or blood product test that includes the analysis of cell-free nucleic acids, OR 2) Such other equivalent tests (which are based on urine or other sample of biological material) as the HHS Secretary deems appropriate. [redacted]

Response to Finding No. 225.4

[redacted]

225.5 H.R. 1946 presents several challenges for MCED test manufacturers. First, manufacturers may expend resources in advocating for a bill that may ultimately lose traction and fail to become law, as seen with the bill's predecessor, H.R. 8845.

Response to Finding No. 225.5

The proposed finding is unsupported by any evidence and should be disregarded. It is also vague because the term "expend resources" is ambiguous.

225.6 Second, assuming the bill is passed, manufacturers will be required to achieve FDA approval or clearance to qualify as a product under the new benefit category. (RX6001 (Deverka Trial Dep. at 49–50); RX6001 (Deverka Trial Dep. at 52; [redacted]

Response to Finding No. 225.6

[redacted]

(iii) Alternative Coverage/Regulatory Pathways

226. CMS has developed several alternative streamlined coverage and reimbursement pathways, although each presents its own set of challenges. Such programs include Parallel Review Pilot Program, which is not currently available to MCED tests, and the recently established Medicare Coverage for Innovative Technologies (MCIT) Pathway, for which the

status is unclear and implementation has been delayed until at least December 2021. (RX6001 (Deverka Trial Dep. at 53–55); RX3867 (Deverka Expert Report) ¶ 55.)

Response to Finding No. 226

[redacted]

227. The Parallel Review Pilot Program. The Parallel Review Pilot Program ("Parallel Review") was established in October 2011 and permanently extended in 2016 to create a mechanism for the FDA and CMS to simultaneously review clinical data, decreasing the time between FDA approval and CMS NCD development. (RX3556 (FDA) at 3; RX3867 (Deverka Expert Report) ¶ 56.)

Response to Finding No. 227

Complaint Counsel has no specific response to the proposed finding.

227.1 Since the program's inception, only two tests, Foundation One CDx and Cologuard, have successfully navigated Parallel Review, despite 26 applications and over 60 inquiries. (RX3052 (RAPS) at 1–2; RX3867 (Deverka Expert Report) ¶ 56.) If a test receives a positive coverage determination via the Parallel Review process, private payors must cover the test for their Medicare Advantage population, but do not need to cover the test for their non-Medicare Advantage beneficiaries. (RX3138 (Podemska-Mikluch, 2018) at 1; RX3867 (Deverka Expert Report) ¶ 56.)

Response to Finding No. 227.1

[redacted]

227.2 As a result of statutory restrictions preventing Medicare from covering preventive services, Parallel Review will not be an option for a MCED test like Galleri unless there is legislative action to add MCED tests as a Medicare benefit category, or alternatively, if the test first receives a grade of A or B following successful USPSTF review. (RX3646 (Social Security Act § 1833 [42 U.S.C. 1395I]); RX6001 (Deverka Trial Dep. at 53–54); RX3867 (Deverka Expert Report) ¶ 57.)

Response to Finding No. 227.2

[redacted]

[redacted]

228. The MCIT Pathway. The Medicare Coverage of Innovative Technology (MCIT) Pathway is a new option that may become effective at the end of 2021, although it is unlikely that CMS will allow the rule to become finalized without additional revision given that CMS has delayed implementation of MCIT twice in 2021.

Response to Finding No. 228

The proposed finding is unsupported by any evidence and should be disregarded. The proposed finding is also vague. The term "Medicare Coverage of Innovative Technology (MCIT) Pathway" is undefined and the terms "new option," "the rule," and "additional revision" are ambiguous. The proposed finding does not specify or explain what the MCIT Pathway is an option for, what rule might become finalized, and what additional revision would allow the rule to become finalized. Therefore, this Court should disregard the proposed finding.

228.1 It was initially proposed in 42 CFR Part 405 in August 2020, but was later delayed as a result of a regulatory freeze implemented by the Biden administration on January 20, 2021. (RX3228 (CMS); RX6001 (Deverka Trial Dep. at 54–55); RX3867 (Deverka Expert Report) ¶ 58.)

Response to Finding No. 228.1

The proposed finding is improper and vague. Respondents' citation to RX3228 is in contravention of this Court's Order regarding post-trial findings. This Court ordered that "[w]hen citing to exhibits, the parties shall identify the document by the PX or RX number, followed by the name of the entity that produced the document, and the page number." Order on Post-Trial Findings at 3. RX3228 is a multi-page document; Respondents fail to provide citations to any specific page number or page range in contravention of the Court's Order. The Court

should disregard this proposed evidence.

The only other sources that Respondents cite for the proposed finding is Dr. Deverka's report and her trial deposition testimony. Thus, the proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is [redacted] in contravention of this Court's Order, and therefore this Court should disregard Respondents' proposed finding.

The proposed finding is vague because the opening word "it" is ambiguous. Respondents do not specify what was initially proposed in 42 CFR Part 405 in August 2020.

> 228.2 While MCIT might offer an accelerated Medicare coverage pathway for certain innovative products, the pathway is limited to FDA-approved or cleared devices and offers only a temporary coverage window of four years, after which a qualifying device loses coverage if not granted coverage via LCD or NCD. (RX3228 (CMS); RX6001 (Deverka Trial Dep. at 54–55); RX3867 (Deverka Expert Report) ¶ 59.)

Response to Finding No. 228.2

The proposed finding is improper and vague. Respondents' citation to RX3228 is in contravention of this Court's Order regarding post-trial findings. This Court ordered that "[w]hen citing to exhibits, the parties shall identify the document by the PX or RX number, followed by the name of the entity that produced the document, and the page number." Order on Post-Trial Findings at 3. RX3228 is a multi-page document; Respondents fail to provide citations to any specific page number or page range in contravention of the Court's Order. The Court should disregard this proposed evidence.

The only other sources that Respondents cite for the proposed finding is [redacted]. Thus, the proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is [redacted]; *see* Order on Post-Trial Findings at 3). Respondents improperly rely on [redacted] to support this proposed finding, in contravention of this Court's Order, and therefore this Court should disregard Respondents' proposed finding.

The proposed finding is vague because the term "certain innovative products" is ambiguous.

5. **Private Payors**

229. Private payors use a robust evidentiary framework when considering coverage for diagnostic tests, including screening tests. (RX6001 (Deverka Trial Dep. at 56); RX3867 (Deverka Expert Report) ¶ 60.) While private payors may consider Medicare coverage policies when determining the coverage provided to their commercial population, payors are only required to implement Medicare coverage policies for their Medicare Advantage populations. (RX3867 (Deverka Expert Report) ¶ 60.)

Response to Finding No. 229

The proposed finding is improper and vague. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is [redacted]; *see*

Order on Post-Trial Findings at 3). And, moreover, [redacted] Respondents improperly rely on [redacted], and therefore this Court should disregard Respondents' proposed finding.

The proposed finding is vague because the term "Medicare Advantage populations" is undefined and the term "robust evidentiary framework" is ambiguous.

230. In addition to the components of evidence development previously discussed – *i.e.*, analytical validity, clinical validity, clinical utility and health economic evidence – payors consider a range of factors when determining medical necessity, such as regulatory approval, the product's clinical indication (intended test use based on the signs, symptoms and populations for which a product is used), and health economics. (RX3043 (Akhmetov, 2015) at 1; RX3005 (Deloitte) at 8; RX3584 (Chambers et al., 2015) at 1.)

Response to Finding No. 230

The proposed finding is misleading and vague. Respondents' failure to [redacted] The proposed finding is vague because the terms "medical necessity" and "health economics" are ambiguous and undefined. Therefore, this Court should disregard the proposed finding.

231. Although all diagnostics do not require FDA-approval/clearance, private payors may factor regulatory status into coverage decisions. Separately, payors will consider the product's target population and intended indication, where products that are intended for use in broad populations, like oncology screening tests, will be subject to greater scrutiny due to increased budgetary impact. (RX3867 (Deverka Expert Report) ¶ 60.)

Response to Finding No. 231

The proposed finding is improper and vague. The proposed finding is improper because

this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is [redacted]; *see* Order on Post-Trial Findings at 3). And, moreover, [redacted] Respondents improperly rely on [redacted], and therefore this Court should disregard Respondents' proposed finding.

The proposed finding is vague because the terms "may factor," "greater scrutiny," and "increased budgetary impact" are ambiguous.

232. When considering the budgetary impact of new products and services, payors will often consider only the short-term benefit to health outcomes, which underemphasizes the potential for long-term cost savings that may be afforded by MCED tests. (RX6001 (Deverka Trial Dep. at 56);RX3084 (Dept. of Veterans Affairs) at 1–2; RX3867 (Deverka Expert Report) ¶ 60.)

Response to Finding No. 232

The proposed finding is misleading, improper, and vague. Respondents' citation to RX3084 is misleading because RX3084 merely provides an explanation of budget impact analysis: a short-term economic assessment from the payor's perspective that estimates the financial consequences of adopting a new intervention. RX3084 does not provide support for the claim that payors often *only* consider short-term benefits when considering the budgetary impact of new services. In other words, RX3084 does not rule out the possibility that payors might consider long-term benefits and cost savings.

The only other sources that Respondents cite for the proposed finding are Dr. Deverka's report and trial deposition testimony. Thus, the proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is [redacted] *see* Order on Post-Trial Findings at 3). Respondents improperly rely on [redacted] to support this proposed finding, in contravention of this Court's Order, and therefore this Court should disregard Respondents' proposed finding.

The proposed finding is vague because the terms "often consider" and "may be afforded" are ambiguous.

F. Specific Barriers and Challenges for Commercialization of MCED Tests

233. As discussed above, manufacturers of new MCED tests face a number of unique challenges regarding test reimbursement and widespread adoption, including the requirement for significant time and financial investments. (RX6001 (Deverka Trial Dep. at 62–64); RX3867 (Deverka Expert Report) ¶ 85; Chahine (Helio) Tr. 1125–27; Getty (Guardant) Tr. 2646–50, 2661.)

Response to Finding No. 233

The proposed finding is improper, unreliable, unsupported, vague, and confusing, and it should be disregarded by this Court. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (*See* Order on Post-Trial Findings at 3). This proposed finding is, in fact, [redacted]; *see* Order on Post-Trial Findings at 3).

And, moreover, [redacted]. The Court should disregard this finding, as it represents Respondents' effort to pass off their expert's opinions as fact.

The proposed finding is unreliable and unsupported. Besides citing to their own expert's opinions, Respondents rely on only two witnesses to support their contention regarding all "manufacturers of new MCED tests"—Mr. Chahine and Mr. Getty. Mr. Chahine is the Chief Medical and Scientific Officer at Helio, and Mr. Getty is Vice President of Commercial, Cancer Screening Core at Guardant. While they can provide relevant information regarding the challenges facing their own companies, Mr. Chahine and Mr. Getty lack foundation to discuss the "unique challenges" facing all "manufacturers of new MCED tests."

For similar reasons, the proposed finding is unsupported by factual evidence. In the trial testimony cited by Respondents, neither Mr. Chahine nor Mr. Getty provide any information regarding the "number of unique challenges" facing their companies "regarding test reimbursement and widespread adoption." Absent this testimony, the only other support Respondents provide is their own expert's report and testimony, which is, again, improper per this Court's Order. As such, this proposed finding is left without any factual support whatsoever.

The proposed finding is vague, insofar as it fails to quantify "a number of," or provide definitions for "widespread adoption" and "significant time." Similarly, the proposed finding is confusing. First, it is unclear what is meant by "manufacturers of new MCED tests." It is unclear what a "new" MCED test would be compared to an "old" MCED test, and how Respondents differentiate between the two. Second, it is unclear what is meant by "unique challenges"—whether the claimed challenges are unique to the manufacturer, unique to the type of test, or unique only to "manufacturers of new MCED tests" versus some other type of MCED

test. Lastly, the proposed finding is misleading insofar as uses "manufacturers of new MCED tests" to differentiate other MCEDs from Grail, as Grail has not achieved reimbursement or widespread adoption. Therefore, this Court should disregard the proposed finding.

> 233.1 Some of these challenges are due to the novel nature of MCED tests such as the detection of multiple cancers simultaneously, navigation of Medicare statutory coverage limitations that currently do not exist for MCED screening, code development and payment assignment processes for a novel product, FDA approval of a multi-cancer screening test, and campaigns for other education and adoption challenges. (RX3867 (Deverka Expert Report) ¶ 85.)

Response to Finding No. 233.1

The proposed finding is improper, confusing, and vague. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (*See* Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is [redacted]; *see* Order on Post-Trial Findings at 3). And, moreover, [redacted] Respondents improperly rely on Dr. Deverka's expert opinions to support this proposed finding, in contravention of this Court's Order, and otherwise [redacted], and therefore this Court should disregard Respondents' proposed finding.

The proposed finding is also confusing and vague. The proposed finding is confusing because it is unclear whether the finding's predicate describes "these challenges" or "the novel nature of MCED tests." Similarly, the proposed finding is vague, as it fails to provide a definition for "these challenges." This Court should disregard the proposed finding because it is

vague and confusing.

234. Illumina's planned acquisition of GRAIL would allow Illumina to provide critical support to address both the unique challenges for early cancer screening as well as the typical challenges that arise for widespread private and public payor coverage. (RX6001 (Deverka Trial Dep. at 62–64); RX3867 (Deverka Expert Report) ¶ 85.)

Response to Finding No. 234

The proposed finding is improper, confusing, and vague. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is [redacted] *see* Order on Post-Trial Findings at 3). And, moreover, [redacted] Respondents improperly rely on Dr. Deverka's expert opinions to support this proposed finding, in contravention of this Court's Order, and otherwise have never provided any evidence to support this proposed finding, either here or in Dr. Deverka's report, and therefore this Court should disregard Respondents' proposed finding.

The proposed finding is misleading as it presumes that Illumina is capable of providing "critical support" to Grail in any capacity. The proposed finding is further misleading in that it assumes the "planned acquisition" is necessary to "allow" Illumina to assist Grail.

The proposed finding is confusing, because it is unclear whether only the claimed "typical challenges" relate to "widespread private and public payor coverage," or whether there are "unique" and "typical" challenges for early cancer screening, both of which relate to widespread private and public payor coverage. Lastly, the proposed finding is vague, because it

fails to provide a definition or explanation of the terms "critical support," "unique challenges," "typical challenges," and "widespread private and public payor coverage."

Finally, the proposed finding is against the weight of the evidence, which shows that, [redacted] The proposed finding is also against the weight of the evidence the extent that it is suggesting that [redacted] Therefore, this Court should disregard the proposed finding.

> 234.1 The particularly innovative aspects of a test that can screen for multiple cancers simultaneously and potentially lead to improvements in cancer outcomes are often the same features that make evaluation of these tests complicated for payors. (RX6001 (Deverka Trial Dep. at 61–62); RX3867 (Deverka Expert Report) ¶ 86.)

Response to Finding No. 234.1

The proposed finding is improper, confusing, and vague. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is [redacted]; *see* Order on Post-Trial Findings at 3). And, moreover, [redacted] Respondents improperly rely on Dr. Deverka's expert opinions to support this proposed finding, in contravention of this Court's Order, and otherwise have never provided any evidence to support this proposed finding, either here [redacted]

[redacted], and therefore this Court should disregard Respondents' proposed finding.

The proposed finding is confusing, perhaps because it is also vague. The proposed finding is confusing and vague because Respondents fail to define "particularly innovative aspects," quantify or define "potentially lead to improvements in cancer outcomes," or quantify what is meant by "often."

The proposed finding is also misleading to the extent it suggests that Illumina is able to advance payor adaptation. Conversely, the weight of the evidence shows [redacted]

Therefore, this Court should disregard the proposed finding.

1. **High Evidence Hurdles**

235. The foremost challenge in bringing a MCED test to market will be the high evidence hurdles that a test developer must surmount before payors will consider providing coverage for the test. (RX6001 (Deverka Trial Dep. at 90–91); RX3867 (Deverka Expert Report) ¶ 87.)

Response to Finding No. 235

The proposed finding is improper, misleading, and vague. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is [redacted]; *see* Order on Post-Trial Findings at 3). And, moreover, [redacted]. Further, Respondents' offered Dr. Deverka as "an

expert concerning the evidence requirements to support payer decision-making for new genomics-based technologies." (RX6001 (Deverka Trial Dep. at 25)). Dr. Deverka has no basis to determine what MCED test developers will consider to be the "foremost challenge" in bringing their tests to market. Respondents improperly rely on Dr. Deverka's expert opinions to support this proposed finding, in contravention of this Court's Order, and otherwise have never provided any evidence to support this proposed finding, either here [redacted], and therefore this Court should disregard Respondents' proposed finding.

The proposed finding is misleading, insofar as it presumes that there is one "foremost challenge" that applies to every MCED test in development without citing to any. The proposed finding is vague, because if fails to define "high evidence hurdles." Moreover, this proposed finding is misleading to the extent that it implies that Grail is not well-positioned to provide clinical evidence to support payor adaptation. As the evidence has shown [redacted]. Therefore, this Court should disregard the proposed finding.

236. MCED tests face particularly burdensome hurdles during evidence development stages given the broad nature of their clinical indication and large scale at which screening methods are implemented. (RX3867 (Deverka Expert Report) ¶ 87.)

Response to Finding No. 236

The proposed finding is improper, misleading, and vague. The proposed finding is improper, because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is [redacted]

[redacted]

The proposed finding is also misleading. First, the proposed finding is misleading insofar as it implies that any MCED tests have a "broad . . . clinical indication." No MCED tests have received clinical indications from the FDA. (PX7086 (Cance (ACS) Dep.) at 49, 58). Second, the proposed finding is misleading insofar as it implies that there are any MCED tests implemented at a "large scale." Similarly, the proposed finding is vague. It fails to define what's meant by "particularly burdensome hurdles," "evidence development stages," "broad nature," and "large scale." [redacted] Therefore, this Court should disregard the proposed finding.

> 236.1 Clinical trials for MCED tests must include many patients from a variety of backgrounds and medical histories. [redacted] Aravanis (Illumina) Tr. 1909–10.) These large sample sizes are required to evaluate MCED tests due to the low prevalence of individual cancer types across the general, asymptomatic population and to account for natural patient attrition during these studies. (RX3867 (Deverka Expert Report) ¶ 87.)

Response to Finding No. 236.1

[redacted]

[redacted]

236.2 Further, studies that look to assess the treatment pathway following cancer detection will require follow-up periods of several years. (RX6001 (Deverka Trial Dep. at 90–91); RX3867 (Deverka Expert Report) ¶ 87.)h

Response to Finding No. 236.2

The proposed finding is improper, vague, and confusing. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3).

[redacted]

[redacted]

The proposed finding is also vague, in that it fails to identify which types of "studies" it discusses, to describe what is meant by "assess[ing] the treatment pathway," and quantify "several." Moreover, the proposed finding is confusing; it is unclear whether (i) there will be multiple "follow-up periods," each lasting "several years"; (ii) there will be multiple "follow-up periods" collectively spanning "several years"; or (iii) whether each study will have one "follow-up period" which will last "several years."

[redacted]

237. High evidence hurdles are the norm for screening tests since the target population is individuals without any signs or symptoms of cancer. (RX3583 (Wilson et al., 1968) at 134; RX3608 (Andermann et al., 2008); RX3156 (Dobrow et al., 2018) at 5.)

Response to Finding No. 237

This proposed finding is vague and confusing, insofar as it fails to define the terms "[h]igh evidence hurdles" and "the norm."

238. It is difficult to be certain about predicting the intended use population for the early adoption of Galleri by payors. (RX6001 (Deverka Trial Dep. at 91–92, 94–95); RX3867 (Deverka Expert Report) ¶ 88.)

Response to Finding No. 238

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

The proposed finding is also unclear. At the outset, it is unclear whether the FDA, payors, MCED test developers, Grail, or Dr. Deverka herself considers it "difficult to be certain about predicting the intended use population for the early adoption of Grail by payors." It is also confusing to determine what exactly is difficult about being "certain about predicting the intended use population." From the finding, it is unclear if it is difficult to evaluate predictions about the intended use population or if it is difficult to ascertain the intended use population itself. Moreover, the proposed finding is vague, in that Respondents fail to define what is meant by "early adoption" and "difficult."

[redacted]

[redacted] Therefore, this Court should disregard the proposed finding.

238.1 Payors may prefer to limit test coverage to higher cancer risk populations to increase the diagnostic yield, limit their financial exposure, and minimize the risk of false positive results, patient anxiety and unnecessary, costly, and potentially harmful follow-up diagnostic procedures. (RX3867 (Deverka Expert Report) ¶ 88.)

Response to Finding No. 238.1

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted] The proposed finding is vague, in that it fails to define what is meant by "limit test coverage," "higher cancer risk populations,"

"diagnostic yield," or "financial exposure." And more importantly, the proposed finding is vague in that it merely discusses, without citation, what "[p]ayors may prefer"—a statement so vague as to hardly be factual at all. Therefore, this Court should disregard the proposed finding.

For the foregoing reasons, this Court should disregard Respondents' proposed finding.

> 238.2 Payors may also want to understand the implications of false negatives to address concerns about the possibility of patients foregoing SOC screening, thereby delaying cancer diagnoses and potentially increasing patient morbidity. (RX3867 (Deverka Expert Report) ¶ 88.)

Response to Finding No. 238.2

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

The proposed finding is confusing, in that it discusses "address[ing] concerns," but does not identify whose concerns need addressing. Moreover, the proposed finding is vague, in that it fails to define "the implications" and "SOC," and fails to both define and quantify what is meant by "potentially increasing." And further, Respondents' proposed finding, without any citation to

factual evidence, simply discusses what "[p]ayors may . . . want"—a statement so vague as to hardly be factual at all. Therefore, this Court should disregard the proposed finding.

> 238.3 GRAIL will need to invest time and resources to develop this evidence, either based on additional clinical studies or real-world evidence. (RX6001 (Deverka Trial Dep. at 91–92, 94–95); RX3867 (Deverka Expert Report) ¶ 88.)

Response to Finding No. 238.3

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

The proposed finding is vague. Respondents fail to define the term "this evidence" or quantify the term "additional clinical studies."

239. Some payors may want to see prospectively collected evidence of the impact of MCED screening on mortality, which will require large, long-term follow-up studies. (RX3867 (Deverka Expert Report) ¶ 89.) Valid assessment of patient safety data requires the return of results to participants in a prospective study. (RX3867 (Deverka Expert Report) ¶ 89.)

Response to Finding No. 239

The proposed finding is improper because this Court held that experts shall not be cited

to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

The proposed finding is vague, as it fails to define the terms "some payors," "prospectively collected evidence," "large," "long-term," "valid assessment," and "prospective study." And moreover, Respondents' proposed finding, without any citation to valid factual evidence, discusses what "[s]ome payors may want"—a statement so vague as to hardly be factual at all. Therefore, this Court should disregard the proposed finding.

240. To date, GRAIL has only returned results to patients in one study. PATHFINDER is a prospective study that enrolled 6,662 participants from seven clinical

institutions in the U.S. between December 2019 and December 2020. (RX3044 (NIH); RX6001 (Deverka Trial Dep. at 93–94); RX3867 (Deverka Expert Report) ¶ 89.)

Response to Finding No. 240

The proposed finding is improper, unsupported, vague, unclear, misleading, and—in multiple ways—in contravention with this Court's Order regarding post-trial findings, and it should be disregarded by this Court. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

Respondents' citation to RX3044 is misleading. This Court ordered that "[w]hen citing to exhibits, the parties shall identify the document by the PX or RX number, followed by the name of the entity that produced the document, and the page number." Order on Post-Trial Findings at 3. RX3044 is a multi-page document; Respondents fail to provide a citation to any specific page number or page range in contravention of the Court's Order. The Court should disregard this proposed evidence. Moreover, this proposed finding is unsupported, as the cited material does not provide any support for Respondents' contention that "Grail has only returned

results to patient in one study."

The first sentence of the proposed finding is unsupported by any citation. This Court's Post-Trial Order explicitly requires that all facts be supported by "specific references to the evidentiary record." (*See* Order on Post-Trial Findings at 2). Here, Respondents have failed to provide any citation to support this sentence, and it is unclear whether the citations following the second sentence apply equally, or at all, to the first sentence. Respondents' proposed finding is also unclear, failing to indicate whether the PATHFINDER study is the "one study" referred to in the first, uncited sentence. Lastly, the proposed finding is vague, in that it fails to define the term "clinical institution."

Complaint Counsel objects to the attribution of RX3044 (a report concerning an NIH study, not an NIH document or a document produced by the NIH) to the NIH as the source of the document, in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3. Therefore, this Court should disregard the proposed finding.

241. Participants whose MCED test results indicated presence of cancer underwent diagnostic testing, as determined by their treating physician informed by standard practice guidelines, to reach a diagnostic resolution - either the diagnosis of an invasive cancer (a "true positive") or no cancer (a "false positive"). (RX3867 (Deverka Expert Report) ¶ 89.)

Response to Finding No. 241

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

[redacted]

This finding is also improper, as Dr. Deverka has no basis to opine—even under the guise of a "fact"—about "standard practice guidelines" or "diagnostic resolutions." Respondents' offered Dr. Deverka as "an expert concerning the evidence requirements to support payer decision-making for new genomics-based technologies." (RX6001 (Deverka Trial Dep. at 25). Her opinions contained within the proposed fact regarding standard practice guidelines and diagnostic resolutions clearly fall outside the scope of the "expertise" for which Respondents' present her. Therefore, this Court should disregard the proposed finding.

> 241.1 Out of 6,629 analyzable test results, 1.4% (or 92 individuals) had a cancer signal detected, and 65 individuals had achieved diagnostic resolution as of March 2021. (RX3053 (Beer et al., 2021).)

Response to Finding No. 241.1

The proposed finding is vague, misleading, and in contravention of the Court's Order regarding post-trial findings, and this Court should therefore disregard Respondents' proposed evidence. The proposed finding is vague, in that it fails to define the term "diagnostic resolution." Similarly, the proposed finding is confusing; it does not identify which study, if any, these "analyzable test results" came from.

Respondents' citation to RX3053 is misleading and in contravention of this Court's Order regarding post-trial findings. This Court ordered that "[w]hen citing to exhibits, the parties shall identify the document by the PX or RX number, followed by the name of the entity that produced the document, and the page number." Order on Post-Trial Findings at 3. RX3053 is a

multi-page document; Respondents fail to provide a citation to any specific page number or page range in contravention of the Court's Order. The Court should disregard this proposed evidence and the proposed finding.

242. While the first prospective study of Galleri is an important initial step to developing the necessary clinical data, additional and larger studies will be required to begin generating the evidence that payors will require. (RX6001 (Deverka Trial Dep. at 93–94); RX3867 (Deverka Expert Report) ¶ 89.)

Response to Finding No. 242

The proposed finding is improper, vague, and misleading. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3).

[redacted]

The proposed finding is vague, as it fails to define the terms "important," "necessary," "additional," and "larger." [redacted]

[redacted]

242.1 The novelty of a MCED screening approach is likely to slow payor evidence reviews given the unprecedented nature of a single test that screens for multiple cancers. [redacted]

Response to Finding No. 242.1

[redacted]

[redacted]

2. Lack of Precedent For Payor Evaluation

243. There is no precedent that payors can rely on for evaluating the clinical validity and utility of MCED tests. (RX6001 (Deverka Trial Dep. at 116–17); RX3867 (Deverka Expert Report) ¶ 90.) MCED tests are a nascent technology and while some companies have announced plans to develop multi-cancer tests in the future, GRAIL's Galleri test is the only MCED test for asymptomatic individuals that is currently available. (PX7105 (Getty (Guardant) Dep. at 23); [redacted]

Response to Finding No. 243

The proposed finding is improper, vague, misleading, and grossly disingenuous, and should be disregarded by the Court. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

[redacted]

The first sentence of Respondents' proposed finding is vague. It fails to identify which type of payor—public or private—the finding discusses, a distinction Respondents' make in other findings. (*See* RPFF ¶ 234). Moreover, Respondents fail to define the terms "clinical validity" and "utility."

[redacted]

244. Given that GRAIL's test has only very recently been introduced, no company currently has, or is close to receiving payor reimbursement for a MCED test, meaning payors would be evaluating and making coverage decisions on MCED tests for the first time. (RX6001 (Deverka Trial Dep. at 116–17); RX3867 (Deverka Expert Report) ¶ 90.)

Response to Finding No. 244

The proposed finding is improper, vague, misleading, and grossly disingenuous, and

should be disregarded by the Court. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

Moreover, the proposed finding is unsupported. Other than the improper citations to their expert's report and testimony, Respondents cite to no evidence to support this claim. Indeed, although Dr. Deverka opines about the reimbursement status of all MCED test developers, Respondents fail to cite to any testimony or evidence from any MCED test developer, payor, or other source to support this claim.

The proposed finding is vague; it does not define which Grail test it is discussing or provide a definition for "very recently been introduced" or "is close to." Therefore, this Court should disregard the proposed finding.

245. Typical payor questions regarding whether a new test is clinically meaningful (clinical validity) or useful (clinical utility) will need to be defined for MCED screening in the first instance, as there is currently no consensus interpretation of clinical validity or clinical utility for a MCED test. (RX3867 (Deverka Expert Report) ¶ 91.)

Response to Finding No. 245

The proposed finding is improper, vague, misleading, and grossly disingenuous, and should be disregarded by the Court. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

Moreover, the proposed finding is unsupported. Other than the improper citation to their expert's report, Respondents cite to no evidence to support this claim. Indeed, although Dr. Deverka opines about "typical payor questions" and "consensus interpretation[s]," Respondents fail to cite to any testimony or evidence from any MCED test developer, payor, or other source to support this claim. Therefore, this Court should disregard the proposed finding.

246. One of the major justifications for adopting MCED screening is the notion of "aggregate prevalence" which refers to where universal screening efficiencies are realized by summing the cancer prevalence rates of individual cancers, thereby increasing the cancer detection rate (CDR), the overall number of true positive cancers detected out of the total number of expected cancers in a monitored population. (RX3715 (Ahlquist, Universal Cancer Screening, 2018) at 4; RX3867 (Deverka Expert Report) ¶ 91.)

Response to Finding No. 246

The proposed finding is improper, vague, and should be disregarded by this Court. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

The proposed finding is vague, as it fails to define "major justifications," and it is similarly confusing, by failing to identify who is making this "major justification[]." The proposed finding is also vague because it fails to define "universal screening efficiencies."

247. Even when adding across the five currently screened cancers, the CDR is only 16% for breast, colorectal, lung, cervical and prostate cancers combined—suggesting a relatively low percentage of cancers are identified by current screening methods. (RX3670 (Ong, 2021) at 1; RX3867 (Deverka Expert Report) ¶ 91.)

Response to Finding No. 247

The proposed finding is improper and vague. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

[redacted]

The proposed finding is vague, in that it fails to define "relatively," and does not indicate what the "relatively low percentage" is relevant to.

248. A MCED test could offer further benefits where the test can screen outside of the five currently screening cancers. (RX3867 (Deverka Expert Report) ¶ 91.) Whereas for many less prevalent cancers single-organ population-wide screening could not be recommended due to the rarity of individual cancer types in average risk adults, a single blood-based test that can detect many different cancer types simultaneously could be justified by aggregating tumor-specific prevalence rates and increasing the overall CDR. (RX3715 (Ahlquist, Universal Cancer Screening, 2018) at 4; RX3867 (Deverka Expert Report) ¶ 91.)

Response to Finding No. 248

Both sentences of Respondents' proposed finding are improper and should be disregarded by the Court. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

249. However, it is unclear whether payors will accept these presumed benefits of MCED screening or if they will continue to review the clinical validity of any new test for each cancer type individually. (RX3867 (Deverka Expert Report) ¶ 91.)

Response to Finding No. 249

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

The proposed finding is vague, failing to define "unclear," "these presumed benefits," and "any new test." The proposed finding is also confusing—in addition to being vague—because the finding contends "it is unclear," but does not indicate to whom "it is unclear" (i.e., whether payors, some other party, or whether Dr. Deverka herself thinks "it is unclear whether payors" will act a certain way). This proposed finding is impermissibly vague and should be disregarded by this Court.

249.1 If payors were to review the clinical validity for individual cancer types, rather than accepting overall MCED test sensitivity and specificity, this would create an additional evidence challenge for test developers. (RX6001 (Deverka Trial Dep. at 61–62); RX3867 (Deverka Expert Report) ¶ 91.)

Response to Finding No. 249.1

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

250. Regardless of how payors review MCED benefits and harms, any MCED test developer, including GRAIL, will need to develop extensive evidence to establish clinical utility of a MCED test. (RX3867 (Deverka Expert Report) ¶ 92.) GRAIL will need to go beyond demonstrating multi-cancer detection rates by cancer type and stage to link these intermediate outcomes to the net health outcomes, such as survival rates and quality of life.

Response to Finding No. 250

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

[redacted]

The second sentence of Respondent's proposed finding is uncited. This Court's Post-Trial Order explicitly requires that all facts be supported by "specific references to the evidentiary record." (*See* Order on Post-Trial Findings at 2). Here, Respondents have improperly provided no citation whatsoever to the evidentiary record, and this Court should therefore disregard this proposed finding.

251. Given the statistical infeasibility of observing significant survival outcome benefits in the near-term, screening outcomes will need to be modeled. (RX3867 (Deverka Expert Report) ¶ 92.) The requisite sample size, duration of follow-up and costs of data collection make these types of studies very expensive with definitive results not available for potentially decades. (RX3867 (Deverka Expert Report) ¶ 92.)

Response to Finding No. 251

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

[redacted]

The proposed finding is vague. It fails to define the terms "statistical infeasibility," "significant," "near-term," "requisite sample size," "duration of follow-up," "costs of data collection," "very expensive," and "potentially decades." The finding is confusing, as it's unclear how the claimed inability to collect data could constitute a "statistical infeasibility"—or, indeed, anything statistical at all. Given Respondents' improper use of expert opinion evidence and because the proposed language is vague, the Court should disregard this proposed finding.

> 251.1 While some single cancer screening models have been used by groups such as CMS to make decisions about covering new tests (e.g., Cologuard for colorectal cancer), there has never been a multi-cancer screening model that has been both peer-reviewed and applied in payor decision-making. (RX3867 (Deverka Expert Report) ¶ 92.)

Response to Finding No. 251.1

The proposed finding is improper, unsupported, vague, and should be disregarded by this Court. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

[redacted]

Absent expert opinion evidence, the proposed finding is unsupported. Indeed, Respondents' proposed finding makes a claim concerning Cologuard, and yet Respondents offer no evidence from Exact Sciences--the company producing Cologuard. Numerous Exact employees sat for depositions and offered testimony at trial, and Exact produced countless documents into the record. Nonetheless, Respondents opted instead to rely on their paid expert's unsubstantiated opinions to support this factual proposition.

The proposed finding is vague because it fails to define or quantify the terms "some," "groups such as CMS," "CMS," "new tests," "payor," and "applied in payor decision making." Moreover, Respondents fail to indicate whether the "payors" making decision in this context are public or private payors.

> 251.2 Further complicating these models is that each specific cancer included in the model will have different detection rates as well as diagnostic and treatment paths. (RX3727 (Berger et al., 2016) at 2–3; RX3867 (Deverka Expert Report) ¶ 92.)

Response to Finding No. 251.2

The proposed finding is improper, vague, and should be disregarded but this Court. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

The proposed finding is vague, in that it fails to define "these models" and "diagnostic

and treatment paths."

252. More work will need to be done to account for modeling issues such as tumor sojourn times (the total time a cancer would exist in a particular stage if left undetected by screening), and estimating lifetime survival benefits given competing risks of death in a multi-cancer context. (RX3178 (Hubbell et al., 2020) at 4–7; RX3149 (van den Broek et al., 2017) at 12–13; RX3867 (Deverka Expert Report) ¶ 92.)

Response to Finding No. 252

The proposed finding is improper, vague, and should be disregarded but this Court. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

The proposed finding is vague because it fails to define "[m]ore work," "account for modeling issues," "lifetime survival benefits," and "competing risks of death." Similarly, the proposed finding is vague and confusing, as it claims "[m]ore work will need to be done," but does not indicate who "need[s]" to perform "[m]ore work."

253. Models that can account for up to 50 cancer types while also following modeling best practices will be extremely complicated, difficult to communicate to payors, and difficult for payors to understand. (RX3178 (Hubbell et al., 2020) at 7; RX3149 (van den Broek et al., 2017) at 12–13.) There will also need to be extensive provider and patient education regarding how to interpret and use Galleri test results in order to create the opportunity to meaningfully measure clinical utility. (RX6001 (Deverka Trial Dep. at 42–43); RX3867 (Deverka Expert Report) ¶ 92.)

Response to Finding No. 253

The proposed finding is improper, vague, misleading, and should be disregarded but this

Court. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

Moreover, to the extent Respondents' proposed finding implies that Grail's Galleri test is capable of detecting 50 cancers, the proposed finding is incomplete and misleading. There is no clinical evidence that Galleri can provide early detection of 50+ cancers in an asymptomatic population. Nor is there clinical evidence that Galleri can provide early detection of 20 cancers in an asymptomatic population, or ten, or for that matter, eight. As of trial, Galleri had been clinically shown to detect only seven types of early stage cancer in an asymptomatic screening population – a fact conceded by Respondents' own expert. ((Cote Tr. 4000-4001) ("Q. So as of today, Galleri has been clinically shown to detect seven types of stage one through three cancer in an asymptomatic screening population, correct? A. That's correct."); [redacted]

[redacted] Respondents' own expert conceded that Stage IV cancer "is almost always incurable and will eventually result in the death of the patient." (RX3869 (Cote Rebuttal Report) ¶ 31). Likewise, the fact that Galleri can detect signals for certain cancers among individuals who have already been diagnosed with cancer does not support Galleri's ability to detect those cancers in an asymptomatic screening population. CCGA did not involve a real-world population but rather was a case-control study that assessed Galleri's ability to detect cancer signals in individuals who had already been diagnosed with cancer. (*See* CCFF ¶¶ 6238-6241). The authors of the CCGA-3 substudy – which Respondents rely upon for their 50-cancer claims – make this point explicitly in their article, cautioning that "CCGA is a case-control study, and as such, is not reflective of performance in a screening population." (RX3409 at 010 (E.A. Klein, et al., Clinical Validation of a Targeted Methylation-Based Multi-Cancer Early Detection Test Using an Independent Validation Set, 9 Annals of Oncology 1167 (2021)). The authors of Grail's CCGA-2 study also provide the same caveat about CCGA, stating: "to understand [Galleri's] performance in an asymptomatic screening population will require additional studies" beyond CCGA. (RX3430 at 10 (M.C. Liu, et al., Sensitive and Specific Multi-Cancer Detection and Localization Using Methylation Signatures in Cell-Free DNA, 6 Annals of Oncology 745 (2020)). [redacted]

[redacted]

The first sentence of Respondents' proposed finding is unsupported. Respondents' claim that certain models "will be extremely complicated, difficult to communicate to payors, and difficult for payors to understand." They provide two citations. The first, to RX3178, is a study purporting to model exactly what Respondents claim is "extremely complicated, difficult to communicate to payors, and difficult for payors to understand." Moreover, RX3178 says nothing about whether such models will be "difficult to communicate to payors" or "difficult for payors to understand." The second source—RX3149—concerns a model evaluating breast cancer screening and has nothing to do with modeling for multiple cancers or whether such a model would be difficult "to communicate to payors" or "for payors to understand." Neither of these sources supports Respondents' proposed finding, leaving it as an unsupported quotation from Dr. Deverka's expert report. The Court should therefore reject this proposed finding.

Respondents' proposed finding is vague. It fails to define "modeling best practices," "extremely complicated," "difficult to communicate to payors," "difficult for payors to understand," "extensive," and "meaningfully measure."

3. Single Cancer vs. Multi-Cancer Screening

254. Currently, all covered screening paradigms involve testing for a single cancer. To obtain coverage for any new single-cancer screening test requires significant evidence, including studies comparing the benefits and risks of the new test to either *no screening* for cancers without current guideline-based testing options, or to the current *standard of care (SOC)* for that particular cancer. (RX3867 (Deverka Expert Report) ¶ 93.)

Response to Finding No. 254

The proposed finding is improper, vague, misleading, and should be disregarded by this Court. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

The proposed finding is vague because the term "standard of care" is undefined. Additionally, the terms "significant evidence" and "current guideline-based testing options" are ambiguous. Respondents do not specify what constitutes "significant evidence" or what guidelines the testing options are based on.

> 254.1 This presents a challenge for MCED tests both because a MCED test may screen for cancers for which there is no current standard of care (*e.g.*, pancreatic cancer) and because there is no current screening paradigm for screening for multiple cancers in a single test. (RX3867 (Deverka Expert Report) ¶ 93.)

Response to Finding No. 254.1

The proposed finding is improper, vague, misleading, and should be disregarded by this Court. The proposed finding is improper because this Court held that experts shall not be cited

to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

The proposed finding is vague because the first word—"[t]his"—is ambiguous. It is unclear what "[t]his" refers to, or what presents a challenge for MCED tests. Additionally, the terms "standard of care" and "screening paradigm" are undefined.

255. For currently screened cancers, the harms of testing are typically well known. For example, screening for lung cancer using low-dose computed tomography carries known biopsy risks to evaluate suspicious nodules. (RX3567 (Wiener et al., 2011) at 8; RX3867 (Deverka Expert Report) ¶ 94.)

Response to Finding No. 255

The proposed finding is vague, improper, and should be disregarded by this Court. The proposed finding is vague because the terms "tomography" and "nodules" are undefined. Additionally, the terms "typically well known" and "known biopsy risks" are ambiguous.

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

[redacted]

255.1 In contrast, while there are clear advantages to MCED screening tests (*e.g.*, ease of use given simple blood draw potentially leading to improved screening compliance) the benefits and harms of MCED tests are largely unknown at this time and will likely differ by tumor site depending on the different types of low-risk and high-risk follow-up diagnostic procedures and the unknown effects of MCED screening on compliance with SOC screening. (RX3428 (Underwood et al., 2019) at 3; RX3867 (Deverka Expert Report) ¶ 94.)

Response to Finding No. 255.1

The proposed finding is vague, improper, misleading, and should be disregarded by this Court. The proposed finding is vague because the opening phrase "in contrast" is ambiguous. It is unclear what the proposed finding is being contrasted to. Further, Respondents fail to define the terms "clear advantages," "largely unknown," "will likely differ," and "the different types of low-risk and high-risk follow-up diagnostic procedures."

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

[redacted]

255.2 Achieving payor coverage for a MCED test based on robust evidence will be both difficult and time-consuming for any company working in the cancer screening space because of these challenges. (RX6001 (Deverka Trial Dep. at 112–13); RX3867 (Deverka Expert Report) ¶ 94.)

Response to Finding No. 255.2

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

The proposed finding is vague. It fails to define the terms "payor coverage," "robust

evidence," "difficult," "time-consuming," and "these challenges." The proposed finding is also unsupported, as it fails to provide any basis other than Respondents' expert's opinion to discuss whether "any company" developing an MCED test will find something "difficult and time-consuming." Respondents' cite to no evidence from those MCED test developers, despite numerous such companies and their representatives providing testimony in depositions and at trial, and providing large abouts of documentary evidence. And, further, such a contention is outside the scope of Dr. Deverka's expertise. Respondents' offered Dr. Deverka as "an expert concerning the evidence requirements to support payer decision-making for new genomics-based technologies." (RX6001 (Deverka Trial Dep. at 25). Dr. Deverka has no basis to opine regarding whether something will be "difficult [or] time-consuming for any company working in the cancer screening space," nor has she been offered to provide such opinions.

256. Studies designed to accurately characterize the benefits and harms of numerous cancers (up to 50 for Galleri) would need to be very large given the low prevalence of asymptomatic cancer in a screen-eligible population (and potential for patient attrition) and unknown harms of screening for cancers that currently do not have a SOC screening modality. (RX3867 (Deverka Expert Report) ¶ 95.)

Response to Finding No. 256

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

[redacted]

The proposed finding is incomplete and misleading. There is no clinical evidence that Galleri can provide early detection of 50+ cancers in an asymptomatic population. Nor is there clinical evidence that Galleri can provide early detection of 20 cancers in an asymptomatic population, or ten, or for that matter, eight. As of trial, Galleri had been clinically shown to detect only seven types of early stage cancer in an asymptomatic screening population – a fact conceded by Respondents' own expert. ((Cote Tr. 4000-4001) ("Q. So as of today, Galleri has been clinically shown to detect seven types of stage one through three cancer in an asymptomatic screening population, correct? A. That's correct."); [redacted] The fact that Galleri can detect signals for certain cancers once those cancers reach Stage IV does not support Galleri's ability to detect those cancers early. (*See, e.g.,* CCFF ¶ 6233). [redacted] Likewise, the fact that Galleri can detect signals for certain cancers among individuals who have already been diagnosed with cancer does not support Galleri's ability to detect those cancers in an asymptomatic screening population.

CCGA did not involve a real-world population but rather was a case-control study that assessed Galleri's ability to detect cancer signals in individuals who had already been diagnosed with cancer. (*See* CCFF ¶¶ 6238-6241). The authors of the CCGA-3 substudy – which Respondents rely upon for their 50-cancer claims – make this point explicitly in their article, cautioning that "CCGA is a case-control study, and as such, is not reflective of performance in a screening population." (RX3409 at 010 (E.A. Klein, et al., Clinical Validation of a Targeted Methylation-Based Multi-Cancer Early Detection Test Using an Independent Validation Set, 9 Annals of Oncology 1167 (2021)). The authors of Grail's CCGA-2 study also provide the same caveat about CCGA, stating: "to understand [Galleri's] performance in an asymptomatic screening population will require additional studies" beyond CCGA. (RX3430 at 10 (M.C. Liu, et al., Sensitive and Specific Multi-Cancer Detection and Localization Using Methylation Signatures in Cell-Free DNA, 6 Annals of Oncology 745 (2020)). The only other study of Galleri for which interim results have been released, PATHFINDER, likewise fails to support the notion that Galleri can provide early detection of 50+ cancers in an asymptomatic population. [redacted]

The proposed finding is also vague, as it fails to define "accurately characterize," "benefits and harms," "numerous cancers," "very large," and "unknown harms."

257. The overall benefit/risk balance for MCED test screening tests as compared to single cancer screening tests will also likely be based on a much larger number of variables derived from multiple tumor types (up to 50 different cancer types in the case of Galleri). (RX3867 (Deverka Expert Report) ¶ 95.)

Response to Finding No. 257

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

The proposed finding is incomplete and misleading. There is no clinical evidence that Galleri can provide early detection of 50+ cancers in an asymptomatic population. Nor is there clinical evidence that Galleri can provide early detection of 20 cancers in an asymptomatic population, or ten, or for that matter, eight. As of trial, Galleri had been clinically shown to detect only seven types of early stage cancer in an asymptomatic screening population – a fact conceded by Respondents' own expert. ((Cote Tr. 4000-4001) ("Q. So as of today, Galleri has been clinically shown to detect seven types of stage one through three cancer in an asymptomatic screening population, correct? A. That's correct."); [redacted]

[redacted] The fact that Galleri can detect signals for certain cancers once those cancers reach Stage IV does not support Galleri's ability to detect those cancers early. (*See, e.g.,* CCFF ¶ 6233). [redacted] Likewise, the fact that Galleri can detect signals for certain cancers among individuals who have already been diagnosed with cancer does not support Galleri's ability to detect those cancers in an asymptomatic screening population. CCGA did not involve a real-world population but rather was a case-control study that assessed Galleri's ability to detect cancer signals in individuals who had already been diagnosed with cancer. (*See* CCFF ¶¶ 6238-6241). The authors of the CCGA-3 substudy – which Respondents rely upon for their 50-cancer claims – make this point explicitly in their article, cautioning that "CCGA is a case-control study, and as such, is not reflective of performance in a screening population." (RX3409 at 010 (E.A. Klein, et al., Clinical Validation of a Targeted Methylation-Based Multi-Cancer Early Detection Test Using an Independent Validation Set, 9 Annals of Oncology 1167 (2021)). The authors of Grail's CCGA-2 study also provide the same caveat about CCGA, stating: "to understand [Galleri's] performance in an asymptomatic screening population will require additional studies" beyond CCGA. (RX3430 at 10 (M.C. Liu, et al., Sensitive and Specific Multi-Cancer Detection and Localization Using Methylation Signatures in Cell-Free DNA, 6 Annals of Oncology 745 (2020)). The only other study of Galleri for which interim results have been released, PATHFINDER, likewise fails to support the notion that

Galleri can provide early detection of 50+ cancers in an asymptomatic population. [redacted]

The proposed finding is vague. It fails to define the terms "overall benefit/risk balance," "will also likely be based," "much larger number of variables," and "derived from multiple tumor types."

> 257.1 For example, MCED tests have shown varying test sensitivity and specificity that differs by cancer site and by cancer stage because these test performance characteristics depend on tumor size, location and cfDNA shedding rates. (RX3427 (Ignatiadis et al., 2021); RX3867 (Deverka Expert Report) ¶ 95.)

Response to Finding No. 257.1

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

[redacted]

Respondents' proposed finding is also improper, insofar as it relies on Dr. Deverka's expert report, because Respondents' offered Dr. Deverka as "an expert concerning the evidence requirements to support payer decision-making for new genomics-based technologies." (RX6001 (Deverka Trial Dep. at 25). Dr. Deverka has no basis to offer opinions regarding whether "these test performance characteristics depend on tumor size, location and cfDNA shedding rates."

258. In addition, the ability to accurately localize the tissue of origin in a screened positive patient may also vary by cancer. (RX3867 (Deverka Expert Report) ¶ 95.) This complexity of benefit/risk assessment for MCED tests was the topic of discussion in a recent FDA public workshop held by Center for Devices and Radiological Health (CDRH) in 2020, and comparable difficulties will arise in payor decision-making as payors evaluate the clinical utility (net benefits) of new MCED tests. (RX3591 (FDA); RX6001 (Deverka Trial Dep. at 63–64); RX3867 (Deverka Expert Report) ¶ 95.)

Response to Finding No. 258

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

The proposed finding is vague. It fails to define the terms "accurately localize," "complexity of benefit/risk assessment," "recent," "comparable difficulties," and "new MCED tests." The proposed finding is also confusing, in that by failing to define what is meant by "new MCED tests," it is unclear which tests the proposed finding is discussing at all.

4. **Evidence of a Clinical Benefit**

259. On average, patients diagnosed with earlier stage cancers have better rates of survival than patients diagnosed with later stage cancers. (RX3867 (Deverka Expert Report) ¶ 96.)

Response to Finding No. 259

The proposed finding is improper, vague, and should be rejected by this Court. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

The proposed finding is vague because the terms "on average," "earlier stage cancers," and "later stage cancers" are ambiguous. For instance, it is not clear whether "earlier stage cancers" refers to stages I-II or I-III.

259.1 For example, the 5–year survival rate for patients diagnosed with Stage I breast cancer (cancer localized to the breast) is 99%, whereas it is only 26% for women diagnosed with Stage IV breast cancer (cancer has spread to other parts of the body). (RX3706 (Susan G. Komen) at 2.)

Response to Finding No. 259.1

The proposed finding is vague and should be rejected by this Court. The proposed finding is vague because the opening phrase "for example" is ambiguous. It is not clear what the proposed finding is being provided as an example for. Therefore, this Court should disregard the proposed finding.

260. The major clinical advantage of MCED test is the presumed ability of the test to detect cancers at earlier stages where the prognosis is better and there is a greater likelihood of cure. (RX3588 (Clarke et al., 2020) at 1; RX3867 (Deverka Expert Report) ¶ 96.)

Response to Finding No. 260

The proposed finding is vague, confusing, improper, and should be rejected by this Court. The proposed finding is vague because the terms "earlier stages" and "better" are ambiguous. For instance, it is not clear whether "earlier stages" refers to stages I-II or I-III nor what constitutes a "better prognosis." Moreover, Respondents fail to define the term "major clinical advantage." The proposed finding is also vague and confusing, insofar as it implies that all MCED tests have the same "presumed ability."

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

[redacted]

261. This benefit of a MCED test is referred to as "downstaging" and is the driver for claims about likely improvements in survival and quality of life. (RX6001 (Deverka Trial Dep. at 61–62); RX3867 (Deverka Expert Report) ¶ 96.)

Response to Finding No. 261

The proposed finding improper, vague, and should be rejected by this Court. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

The proposed finding is vague because the term "downstaging" is undefined and it is not clear what "this benefit" refers to. Respondents also fail to define the term "likely improvements." Respondents do not quantify what is meant by "likely."

261.1 This is particularly important for cancers without a current screening modality such as pancreatic or ovarian cancers where the assumption is that a cancer diagnosis obtained through screening is always better than waiting for symptoms to develop. (RX3867 (Deverka Expert Report) ¶ 96.)

Response to Finding No. 261.1

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

The proposed finding is vague because it fails to define the phrase "[t]his" and "particularly important." The proposed finding is also confusing because it claims "the assumption is," but does not indicate who is making this assumption or whether this is an assumption made by Dr. Deverka.

262. However, payors may challenge this assumption as related to lead-time bias: the phenomenon where patients' time of death is unchanged, but when measuring survival from the time cancer was screened-detected leads to the erroneous conclusion that survival is improved. (RX3867 (Deverka Expert Report) ¶ 96.)

Response to Finding No. 262

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

[redacted]

The proposed finding is vague in that it fails to define "this assumption," "screened-detected," and "erroneous conclusion." The proposed finding is also confusing, verging on nonsensical. It is unclear what is meant, at all, by the phrase "payors may challenge this assumption as related to lead-time bias."

> 262.1 As a result, payors may require additional clinical utility evidence to establish increased survival due to earlier detection. (RX6001 (Deverka Trial Dep. at 61–62); RX3867 (Deverka Expert Report) ¶ 96.)

Response to Finding No. 262.1

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

[redacted]

The proposed finding is vague. It fails to define "additional," and it is unclear what this proposed finding is "a result" of. Moreover, Respondents' proposed finding discusses what "payors may require," which establishes no factual information whatsoever.

263. With respect to Galleri, specifically, the sensitivity of the assay varies by tumor type and stage. (RX3430 (Liu et al., 2020) at 1; RX3867 (Deverka Expert Report) ¶ 97.) In addition to Galleri, Thrive has published results of a multi-cancer clinical study indicating different levels of sensitivity and specificity. (RX3867 (Deverka Expert Report) ¶ 97, n.193; RX3419 (Lennon et al., 2020).)

Response to Finding No. 263

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

The proposed finding is also in contravention of this Court's Order on Post-Trial Findings, as it fails to provide a pin citation in support of the second sentence. This Court

ordered that "[w]hen citing to exhibits, the parties shall identify the document by the PX or RX number, followed by the name of the entity that produced the document, and the page number." Order on Post-Trial Findings at 3. RX3419 is a multi-page document; Respondents fail to provide a citation to any specific page number or page range in contravention of the Court's Order. The Court should disregard this proposed evidence.

> 263.1 Given the reliance of the assay on detecting tumor DNA (ctDNA) fragments in the blood—which increase as cancer develops into later stages, it is unsurprising that Galleri has the highest sensitivity for later stage cancers as these represent tumors that have spread regionally or distantly and tend to shed a higher amount of ctDNA. (RX3773 (Klein et al., 2021); RX3867 (Deverka Expert Report) ¶ 97.)

Response to Finding No. 263.1

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

The proposed finding is also in contravention of this Court's Order on Post-Trial Findings, as it fails to provide a citation to a page number in support of the second sentence.

This Court ordered that "[w]hen citing to exhibits, the parties shall identify the document by the PX or RX number, followed by the name of the entity that produced the document, and the page number." Order on Post-Trial Findings at 3. RX3773 is a multi-page document; Respondents fail to provide a citation to any specific page number or page range in contravention of the Court's Order. Absent Respondents' citation to improper expert opinion and improper citation to RX3773, the proposed finding is unsupported, and the Court should disregard this proposed evidence.

5. **Additive To Current Screening Tests**

264. Because Galleri is intended to be additive to current standard-of-care screening tests, this approach raises additional questions for payors. (PX7130 (Deverka Dep. at 198); RX3867 (Deverka Expert Report) ¶ 98.)

Response to Finding No. 264

The proposed finding improper, vague, unsupported, and should be disregarded by this Court. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

The proposed finding is vague because it does not specify what "additional questions" are raised for payors. Additionally, it is not clear what "this approach" refers to. Respondents provide no evidence—other than Dr. Deverka's opinion—to support the contention that "Galleri is intended to be additive to current standard-of-care screening tests."

> 264.1 For example, what are the additional clinical benefits of the MCED test for currently screened cancers versus the benefits of the MCED test for cancers that have no currently recommended screening modalities? (RX3867 (Deverka Expert Report) ¶ 98.)

Response to Finding No. 264.1

The proposed finding improper, vague, and should be disregarded by this Court. The proposed finding should be disregarded because Respondents have posed a question, rather than provide a "finding of fact," in direct contravention of this Court's Order (*See* 16 C.F.R. § 3.46; *see generally* Order on Post-Trial Findings). [redacted]

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

[redacted]

The proposed finding is vague because the opening phrase "for example" is ambiguous. It is unclear what the proposed finding is being provided as an example for. Additionally, the proposed finding does not specify what are the "additional clinical benefits" of the MCED test for currently screened cancers or cancers that have no currently recommended screening modalities.

> 264.2 And what evidence will be required by payors to mitigate the concern that patients who are tested with Galleri and found to have a "no cancer detected" result may have a false sense of reassurance and therefore decreased adherence to routine screening interventions? (RX3867 (Deverka Expert Report) ¶ 98.)

Response to Finding No. 264.2

The proposed finding improper, vague, and should be disregarded by this Court. The proposed finding should be disregarded because Respondents have posed a question, rather than provide a "finding of fact," in direct contravention of this Court's Order (*See* 16 C.F.R. § 3.46; *see generally* Order on Post-Trial Findings). [redacted]

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). [redacted]

[redacted]

264.3 These issues stem from the unique features of MCED tests and are likely to complicate payor evidence reviews as part of coverage decision-making and will require significant educational outreach to payors on the part of MCED test developers. (PX7130 (Deverka Dep. at 198); RX3867 (Deverka Expert Report) ¶ 98.)

Response to Finding No. 264.3

[redacted]

[redacted]

[redacted]

[redacted]

6. **Economic Considerations**

265. With a target population of individuals aged 50 or older with average cancer risk, the size of the eligible population for Galleri and other MCED tests is very large (i.e., most individuals ages 50–79). (RX3867 (Deverka Expert Report) ¶ 99.) [redacted]; Qadan (Illumina) Tr. 4109.)

Response to Finding No. 265

[redacted]

[redacted]

266. Affordability is heavily dependent on the price of Galleri and the testing interval (every 2 years, every year, or more frequently) with significant near-term impact on the per member per month (PMPM) costs of delivering care to an insured population. (RX3867 (Deverka Expert Report) ¶ 100.)

Response to Finding No. 266

[redacted]

267. [redacted]

Response to Finding No. 267

[redacted]

268. While GRAIL and other future MCED test manufacturers may be able to address these economic considerations by emphasizing the value (cost/outcome) of Galleri, in particular long-term value, that argument may not be persuasive to private insurers. (RX6001 (Deverka Trial Dep. at 34–35); RX3867 (Deverka Expert Report) ¶ 101.) In this context, value (synonymous with cost-effectiveness) is defined as patient cancer-related health outcomes achieved relative to the costs associated with cancer detection and appropriate clinical follow-up care. (RX3867 (Deverka Expert Report) ¶ 101.)

Response to Finding No. 268

[redacted]

[redacted]

269. Costs are most commonly measured from the health care payor perspective. (RX3867 (Deverka Expert Report) ¶ 101.) Value assessment is inherently comparative, as the goal is to inform the question, "should we pay for this new test *compared to the standard of care?*" (RX3867 (Deverka Expert Report) ¶ 101.)

Response to Finding No. 269

The proposed finding improper, vague, and should be disregarded by this Court. [redacted]

[redacted]

[redacted]

270. If the presumed benefits of MCED screening approaches are realized, this will result in improved survival and quality of life for individuals detected with cancer due to downstaging, which can be measured as cost-effectiveness. (RX6001 (Deverka Trial Dep. at 34–35); RX3867 (Deverka Expert Report) ¶ 101.)

Response to Finding No. 270

The proposed finding improper, vague, and should be disregarded by this Court. [redacted]

[redacted]

270.1 For a stable insured population, downstaging is expected to translate into cancer-specific cost-effectiveness because of improved survival and reduced cancer treatment costs or even cures. (RX6001 (Deverka Trial Dep. at 34–35); RX3867 (Deverka Expert Report) ¶ 101.)

Response to Finding No. 270.1

The proposed finding improper, vague, and should be rejected by this Court. [redacted]

[redacted]

[redacted]

271. However, even if Galleri is likely to be cost-effective, it will likely not be cost saving. (RX3867 (Deverka Expert Report) ¶ 102.) Whereas a "cost-effective" new technology produces more health benefits at greater cost relative to the current standard of care, a "cost saving" new technology produces the same or more health benefits at a lower cost than the current standard of care. (RX3160 (Goodell et al., 2009) at 2; RX6001 (Deverka Trial Dep. at 115–16); RX3867 (Deverka Expert Report) ¶ 102.)

Response to Finding No. 271

The proposed finding is improper, vague, and should be rejected by this Court. [redacted]

[redacted]

272. Most new technologies introduced into the healthcare marketplace are cost-effective, not cost-saving, with the health benefits accruing over a patient's lifetime. (RX3867 (Deverka Expert Report) ¶ 102.) In the U.S., private payors, however, often have a short time horizon for decision-making (1–3 years) because of high member turnover. (RX3671, (Graves et al., 2017) at 8.)

Response to Finding No. 272

[redacted]

273. These private payors evaluating a new screening test may be less likely to cover a test that is not cost saving despite the potential cost-effectiveness over a longer time period because U.S. private payors are less likely to see the benefits of cost-effective devices during an individual patient's subscription to a particular insurer's plan. (RX3867 (Deverka Expert Report) ¶ 102.)

Response to Finding No. 273

[redacted]

[redacted]

274. Test manufacturers will likely have to expend significant efforts to encourage private payors to incorporate cost-effectiveness data into their evaluation process for MCED tests. (RX3867 (Deverka Expert Report) ¶ 102.)

Response to Finding No. 274

[redacted]

[redacted]

275. In contrast, net health outcome benefits may be more persuasive to Medicare given their lifetime insurance responsibilities to beneficiaries. (RX3867 (Deverka Expert Report) ¶ 102.) In addition, there is evidence that Medicare does consider cost-effectiveness data in their evaluation of preventive services. (RX3459 (Chambers et al., 2014) at 3–4.) Medicare is also prohibited from basing coverage decisions on cost effectiveness data. (RX3458 (Neumann et al., 2012); RX3867 (Deverka Expert Report) ¶ 102, n.199.)

Response to Finding No. 275

The proposed finding is improper, vague, and should be disregarded by this Court. [redacted]

[redacted]

[redacted]

276. Payors will also likely consider the economic costs incurred through the diagnostic follow up required for patients who receive a positive result from a MCED test. (RX3867 (Deverka Expert Report) ¶ 103). Similar to most current single cancer screening tests, while Galleri can presumptively localize the tumor, follow-up diagnostic testing will be required to definitively rule-in cancer. (RX3867 (Deverka Expert Report) ¶ 103.)

Response to Finding No. 276

[redacted]

[redacted]

277. While data from case-control studies indicates Galleri has a very high specificity level (over 99%), until there are robust prospective data about the rates of false positive results with Galleri in average risk populations, payors are likely to be concerned about the potential for downstream clinical and economic harms with MCED screening approaches. (RX3430 (Liu et al., 2020) at 1; RX3867 (Deverka Expert Report) ¶ 103.)

Response to Finding No. 277

[redacted]

[redacted]

277.1 For example, a false positive result with Galleri could lead to unnecessary diagnostic testing and costs, the risk of procedure-related complications, and diminished patient quality of life. (RX3867 (Deverka Expert Report) ¶ 103.)

Response to Finding No. 277.1

[redacted]

278. The PATHFINDER study was GRAIL's first study that returned results of Galleri to patients at both average and increased risk of cancer. (RX3044 (NIH); RX3867 (Deverka Expert Report) ¶ 103.)

Response to Finding No. 278

The proposed finding is improper, unsupported, vague, unclear, misleading, and—in

multiple ways—in contravention with this Court's Order regarding post-trial findings, and it should be disregarded by this Court. [redacted]

Respondents' citation to RX3044 is improper and misleading. This Court ordered that "[w]hen citing to exhibits, the parties shall identify the document by the PX or RX number, followed by the name of the entity that produced the document, and the page number." Order on Post-Trial Findings at 3. RX3044 is a multi-page document; Respondents fail to provide a citation to any specific page number or page range in contravention of the Court's Order. The Court should disregard this proposed evidence. Moreover, this proposed finding is unsupported, as the cited material does not provide any support for Respondents' contention that PATHFINDER was "GRAIL's first study that returned results of Galleri to patients at both average and increased risk of cancer."

Complaint Counsel objects to the attribution of RX3044 (a report concerning an NIH

study, not an NIH document or a document produced by the NIH) to the NIH as the source of the document, in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3.

279. Payors will likely require further evidence to establish the clinical utility (net benefit) of Galleri and for payors to effectively evaluate the full economic costs of Galleri, including the costs of false positives. (RX6001 (Deverka Trial Dep. at 93–94); RX3867 (Deverka Expert Report) ¶ 103.); Aravanis (Illumina) Tr. 1947.)

Response to Finding No. 279

[redacted]

7. **Equitable Access and the Size of the Eligible Patient Population**

280. The current lack of private and public payor coverage raises significant concerns about equality and access to potentially life-saving tests. (PX7130 (Deverka Dep. at 23–25);

RX3867 (Deverka Expert Report) ¶ 104.) There are numerous disparities in cancer screening adherence and cancer outcomes for minorities and other underserved populations. (RX3662 (Patel et al., 2020) at 1).

Response to Finding No. 280

The proposed finding is improper, vague, and should be rejected by this Court. [redacted]

280.1 Where a new technology could serve to expand access to cancer screening tests, all efforts should be made to avoid exacerbating these disparities and in fact to work towards reducing them in healthcare. (RX3180 (Virnig et al., 2009) at 6–8; RX3867 (Deverka Expert Report) ¶ 104.)

Response to Finding No. 280.1

The proposed finding is vague, confusing, and should be rejected by this Court. [redacted]

[redacted]

281. Factors that are being studied for their relationship to poorer cancer outcomes include insurance status, care-seeking behaviors, income, education, racial differences in healthcare providers, providers' role in delayed diagnosis and Medicaid enrollment. (RX3088 (Zavala et al., 2020) at 2–3; RX3867 (Deverka Expert Report) ¶ 104.)

Response to Finding No. 281

[redacted]

282. The preferred approach is to take advantage of the potential for improved insured member uptake because of reliance on a simple blood draw so that the benefits of MCED screening can be equitably shared. (PX7130 (Deverka Dep. at 23–25); RX3867 (Deverka Expert Report) ¶ 104.)

Response to Finding No. 282

The proposed finding is improper, vague, and should be rejected by this Court. [redacted]

[redacted]

283. Improved cancer outcomes for all persons will not be achieved if MCED screening is introduced under a strictly limited access framework that makes testing narrowly available to only those individuals that can afford these tests by paying out of pocket or who may be members of executive wellness programs or other employer-sponsored wellness initiatives—individuals that on average have lower cancer risk because of their younger age as compared to retirees. (RX3507 (NCI); RX3867 (Deverka Expert Report) ¶ 105.)

Response to Finding No. 283

The proposed finding is improper, misleading, and vague. [redacted]

[redacted] Yet Respondents' citation to RX3507 is misleading. RX3507 only references age and cancer risk. (RX3507 (NCI)). It does not address the availability of MCED tests, frameworks for MCED screening, and executive wellness programs or other employer-sponsored wellness initiatives. (*See* RX3507 (NCI)). Thus, RX3507 does not support the

majority of the proposed finding—only the claim that younger individuals have on average lower cancer risk compares to older individuals. [redacted]

283.1 For example, Galleri is currently available without any insurance coverage at a list price of $949 per test. (RX3253 (GRAIL); RX3867 (Deverka Expert Report) ¶ 105.)

Response to Finding No. 283.1

The proposed finding is improper, unsupported, and vague. [redacted] Respondents' proposed finding is only supported by RX3253. Yet RX3253 does not provide any support for the claim that Galleri

is currently available without any insurance coverage at a list price of $949 per test. RX3253 is an FAQ answering general questions about the Galleri test that does not address cost at all. Absent RX3253 and [redacted] Respondents' proposed finding is unsupported and should be rejected by this Court.

[redacted]

284. Paying out of pocket for an over $900 test that could be potentially life-saving may not be a significant burden for wealthy individuals but it is likely to be far outside the budget of most Americans. (RX3867 (Deverka Expert Report) ¶ 105.) The sooner that Galleri can be adopted and covered by a broad range of payors, the more likely the test could ameliorate long-standing disparities in access and outcomes. (PX7130 (Deverka Dep. at 23–25); RX3867 (Deverka Expert Report) ¶ 105.)

Response to Finding No. 284

[redacted]

[redacted]

8. **Stakeholder Engagement**

285. Given that MCED is a new technology class, payors do not yet have relevant coverage policies. (RX3867 (Deverka Expert Report) ¶ 106). As such, MCED test manufacturers will have to engage with Medicare, Medicaid *and* private payors to adequately demonstrate medical appropriateness based on developed evidence prior to development of new policies. (RX6001 (Deverka Trial Dep. at 31–32); RX3867 (Deverka Expert Report) ¶ 106; Qadan (Illumina) Tr. 4152–53.)

Response to Finding No. 285

The proposed finding is improper, unsupported, and vague. [redacted]

First, Respondents cite only to the unfounded, self-serving testimony of a single Illumina executive, which is uncorroborated by any ordinary course documents or analysis. Given the inherent unreliability of this testimony as well as lack of foundation or explanation for the executive's base conjecture, this proposed finding of fact should be disregarded. Second, the proposed finding is unsupported to the extent that it purports to speak for the needs of all MCED developers to engage with Medicare, Medicaid, and private payors while relying solely on the self-serving testimony of an Illumina executive. Dr. Qadan does not have foundation to offer "facts" regarding the needs of all MCED developers.

286. Payors may be apprehensive to provide coverage due to the large indicated population, and therefore substantial budgetary impact, of screening applications without clear evidence of the benefits and harms (clinical utility) of MCED tests. (RX3867 (Deverka Expert Report) ¶ 106).

Response to Finding No. 286

[redacted]

287. Given the challenges and the novelty of MCED screening, test manufacturers will be required to engage with multiple stakeholders to not only demonstrate the utility and effectiveness of their product but to generate interest and understanding about a new testing paradigm. (RX6001 (Deverka Trial Dep. at 31–32); RX3867 (Deverka Expert Report) ¶ 106).

Response to Finding No. 287

[redacted]

[redacted]

288. After development of new codes, corresponding payment assignment, robust evidence development and securement of private and public payor coverage, MCED test manufacturers will still need to overcome a number of educational barriers prior to widespread test adoption, including at the prescribing physician, patient and payor level. (RX6001 (Deverka Trial Dep. at 42–43); [redacted]

Response to Finding No. 288

[redacted]

[redacted]

288.1 The former Vice President of Clinical Business Development at Illumina, John Leite, summarized this particular challenge as: "[O]nce you have a test approved . . . you have to spend money to educate physicians, to educate payors, to educate hospital systems and employers as to why it's important to adopt your tests. And ultimately you're investing to change physician behavior to ultimately change the standard of care. All of these programs are very expensive and require capital." (PX7088 (Leite (Illumina/InterVenn) Dep. at 33).)

Response to Finding No. 288.1

The proposed finding is misleading and vague, and this Court should therefore disregard this proposed evidence. Insofar as it implies that Illumina can assist Grail with the "very expensive [challenge]" described in this finding, such an implication is against the weight of the evidence, [redacted] The proposed finding is vague, in that it fails to define "this particular challenge." Therefore, this Court should disregard the proposed finding.

289. Physicians may be reluctant to adopt new technology, particularly as they may be uncertain how to interpret test results. (PX6097 (Abrams Expert Report) ¶ 32; RX3867 (Deverka Expert Report) ¶ 108.) Galleri offers a sensitivity of ~50% and a specificity of approximately 99%; the specificity rate of ~99% means that a positive test result is a reliable indication of cancer and has a very low risk that healthy individuals will be falsely diagnosed. (RX3279 (Precision Oncology); RX3867 (Deverka Expert Report) ¶ 108.)

Response to Finding No. 289

[redacted]

[redacted]

290. However, the ~50% sensitivity rate (while higher than some current SOC screening tests) means that a negative test result does not guarantee that the patient does not have cancer. (RX3867 (Deverka Expert Report) ¶ 108.) While these rates may be appropriate for Galleri as a screening application, how to interpret and respond to aggregate cancer detection results may not be intuitive to all clinicians. (RX3867 (Deverka Expert Report) ¶ 108.)

Response to Finding No. 290

[redacted]

[redacted]

291. The proper integration of positive MCED test results into the oncology clinical pathway may also differ across tumor types, which could require additional training for physicians depending on their specialty. (RX3534 (Putcha G., One Size Does Not Fit All); PX7130 (Deverka Dep. at 23–25); RX3867 (Deverka Expert Report) ¶ 108.)

Response to Finding No. 291

[redacted]

[redacted]

292. In addition to educational campaigns, GRAIL will need to engage with specialty societies and patient advocacy organizations, and drive inclusion of MCED screening in standard treatment paradigms as outlined in key oncology treatment guidelines, such as those developed by NCCN. (RX6001 (Deverka Trial Dep. at 175–76); RX3867 (Deverka Expert Report) ¶ 109.)

Response to Finding No. 292

[redacted]

[redacted]

293. The totality of these efforts will require substantial resources, time, and funding to ensure broad MCED screening access beyond initial commercial availability. (RX6001 (Deverka Trial Dep. at 175–76); RX3867 (Deverka Expert Report) ¶ 109.)

Response to Finding No. 293

[redacted]

[redacted]

G. Developing a New Cancer Screening Test Capable of Screening for Multiple Cancers Simultaneously is Difficult and Takes Years

294. It is undisputed that developing a cancer screening test, particularly a cancer screening test that simultaneously identifies more than one type of cancer, is a challenging endeavor. [redacted]

Response to Finding No. 294

[redacted]

[redacted]

295. Many years of research and development are needed to generate a blood-based assay that has the appropriate biomarkers needed to have the requisite sensitivity and specificity, not to mention ability to detect a molecular cancer signal of origin. (RX3869 (Cote Expert Report) ¶ 99.)

Response to Finding No. 295

Complaint Counsel objects to the proposed finding because it is vague, it is incomplete and misleading, it improperly cites expert testimony, Dr. Cote is not qualified to provide opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

The proposed finding is vague because it does not define "appropriate biomarkers" or "requisite sensitivity and specificity."

The proposed finding is incomplete and misleading to the extent that it suggests that there is agreement or consensus that algorithmic tissue of origin prediction will ultimately prove superior to other methods of identifying the location of cancer as part of MCED testing, such as PET-CT. [redacted]

[redacted]

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only source of evidence supporting the facts in the proposed finding in contravention of this Court's Order. This Court should disregard this evidence.

Dr. Cote is not qualified to provide expert opinion testimony about the process and timeline for developing a multicancer screening test because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)).

Dr. Cote is not a credible witness, so his opinion does not deserve any weight. Dr. Cote

offered opinion testimony in this matter that spans multiple disparate subjects and exceeds his expertise; his trial testimony also contained unsupported claims about his experience related to MCED test development that exceed the information disclosed in his report in violation of this Court's order; and his previous prediction of upstream entry was wrong casting doubt on similar analysis in this case. (*See* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects)).

In addition to Dr. Cote being unqualified and not credible, his opinion about the process and timeline for commercializing an MCED test is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. Therefore, this Court should disregard the proposed finding

> 295.1 GRAIL was launched in 2016 within Illumina, and was only able to launch its multi-cancer screening test as an LDT in 2021. (Flatley (Illumina) Tr. 4090; Bishop (GRAIL) Tr. 1322–23.) GRAIL is still years away from seeking FDA approval for its multi-cancer screening test. (Bishop (GRAIL) Tr. 1343; PX7069 (Bishop (GRAIL) IHT at 94).)

Response to Finding No. 295.1

Complaint Counsel objects to the proposed finding because it is vague, misleading, and relies on self-serving testimony.

The proposed finding is vague because it does not define what it means to be "launched … within Illumina."

The proposed finding is misleading because it does not indicate when GRAIL commenced work on an MCED test and because it suggests that all MCED developers will proceed through the same development path and at the pace as GRAIL.

The proposed finding relies solely on the self-serving testimony of Illumina former Executive Chairman and CEO Jay Flatley to report on GRAIL's progress to date, and solely on

the self-serving testimony of GRAIL CEO Hans Bishop to forecast GRAIL's future progress.

Therefore, this Court should disregard the proposed finding

296. Similarly, Thrive was originally founded based on the research from a company called PapGene as well as research from Johns Hopkins University. (PX7101 (Vogelstein (Johns Hopkins University) at 27–28; [redacted] PapGene was started in 2014. (PX7101 (Vogelstein (Johns Hopkins University) Dep. at 27–28).)

Response to Finding No. 296

[redacted]

296.1 Thrive has still not launched a commercial version of its cancer screening test, CancerSEEK, seven years later. [redacted]

Response to Finding No. 296.1

[redacted]

[redacted]

296.2 In late 2020, Exact Sciences acquired Thrive. [redacted] PX7101 (Vogelstein (Johns Hopkins University) Dep. at 48–49).)

1. **Sample Collection and Initial Research**

303. While test developers may pursue these steps in different orders, the initial steps typically involve sample collection, research and biomarker discovery. (Cote Tr. 3783–85; RX3869 (Cote Expert Report) ¶ 104.)

Response to Finding No. 303

Complaint Counsel agrees that MCED test developers do not subscribe to the one-size-fits-all artificial development and commercialization roadmap and timeline that Dr. Cote imposes in his flawed analysis. The proposed finding—which, like numerous of Respondents' other proposed findings, is copied and pasted verbatim from Dr. Cote's report—shows that Dr. Cote admits MCED developers do not all follow the same steps to commercialization in the same order, and that Dr. Cote does not know what path any particular developer will pursue. Moreover, Dr. Cote's admission that these steps may be done in any particular order shows they may also be done in parallel.

Complaint Counsel objects to the proposed finding because it improperly cites expert testimony, Dr. Cote is not qualified to offer expert opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only source of the purported facts in the proposed finding in contravention of this Court's Order. This Court should disregard this evidence, leaving this finding unsupported.

Dr. Cote is not qualified to provide expert opinion testimony about the process and timeline for developing a multicancer screening test because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)).

Dr. Cote is not a credible witness, so his opinion does not deserve any weight. Dr. Cote offered opinion testimony in this matter that spans multiple disparate subjects and exceeds his expertise; his trial testimony also contained unsupported claims about his experience related to MCED test development that exceed the information disclosed in his report in violation of this Court's order; and his previous prediction of upstream entry was wrong casting doubt on similar analysis in this case. (*See* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects)).

In addition to Dr. Cote being unqualified and not credible, his opinion about the process and timeline for commercializing an MCED test is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. Therefore, this Court should disregard the proposed finding.

304. Specifically, a given company needs to collect samples for the new cancer type to perform the new biomarker discovery; even if this company had previously collected samples for one cancer type, these existing samples would not have the new proposed cancer type.
[redacted]

Response to Finding No. 304

[redacted]

[redacted]

[redacted]

304.1 It is critical that samples are collected uniformly according to a sample collection protocol to ensure high quality samples that are comparable. (Aravanis (Illumina) 1899–1900.) "If you were just to mix and match samples collected in different ways from different purposes, you would end up finding [cancer] signals that are just artifacts of those methods. And were you to develop a test in that way . . . likely it wouldn't perform well." (Aravanis (Illumina) 1899–1900.)

Response to Finding No. 304.1

Complaint Counsel objects to the proposed finding because it is vague, self-serving, and inherently speculative.

The proposed finding is vague because it does not explain the context or define what is meant by "samples," "sample collection protocol," "high quality samples," "comparable," or "different purposes."

The proposed finding is self-serving and inherently speculative because for support Respondents cite only to unfounded, self-serving testimony of an Illumina executive that is uncorroborated by any ordinary course documents or analysis. Given the inherent unreliability of this testimony as well as lack of foundation or explanation for the executive's base conjecture,

this proposed finding of fact should be disregarded.

304.2 [redacted]

Response to Finding No. 304.2

[redacted]

305. During the sample collection period, the test developer may also perform initial technology development and preliminary feasibility studies. [redacted]

Response to Finding No. 305

[redacted]

[redacted]

[redacted]

[redacted]

305.1 For example, as part of the preliminary feasibility assessment, the developer would assess what the development plan would look like, how much it would cost and its probability of success. [redacted]

Response to Finding No. 305.1

[redacted]

[redacted]

[redacted]

[redacted]

306. Biomarker discovery involves efforts by the test developer to identify which biomarkers are the best at predicting that an individual has cancer, and particularly, if that biomarker may be used to distinguish between an individual who has cancer and a healthy subject. [redacted]

Response to Finding No. 306

[redacted]

[redacted]

[redacted]

[redacted]

306.1 Biomarker discovery may involve research to understand what the biological drivers are, and depending on the drivers and the relevant mutations, a given biomarker may be selected. [redacted]

Response to Finding No. 306.1

[redacted]

[redacted]

306.2 While test developers may review the scientific literature, [redacted] given the interest of test developers in developing a test that is unique and differentiated, developers are likely to attempt to identify new biomarkers and loci that are not present in the literature. (RX3869 (Cote Expert Report) ¶ 105.)

Response to Finding No. 306.2

[redacted]

[redacted]

[redacted]

[redacted]

306.3 Once the test developer has discovered relevant biomarkers from the research step, which can take three to five years, the developer moves into assay development or optimization. [redacted]

Response to Finding No. 306.3

[redacted]

[redacted]

[redacted]

[redacted]

306.4 The research stage can often be a substantial investment, costing in the ballpark of $100 to $150 million when accounting for the samples analyzed and the requisite processing. [redacted]

Response to Finding No. 306.4

[redacted]

[redacted]

[redacted]

[redacted]

306.5 According to Dr. Cote, biomarker discovery can take anywhere from 18 months to three years, and in some cases much longer. (Cote Tr. 3785–86.)

Response to Finding No. 306.5

Complaint Counsel objects to the proposed finding because it is misleading, against the weight of the evidence, and because it improperly cites expert testimony, Dr. Cote is not qualified to provide expert opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is unreliable.

The proposed finding is misleading to the extent it suggests that all MCED test developers conduct an identical discrete "biomarker discovery" phase that does not overlap with other test development activities or that all MCED test developers must in general follow an identical, one-size-fits-all, artificial development and commercialization roadmap and timeline that Dr. Cote invented in his flawed analysis.

[redacted]

[redacted]

[redacted]

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as a source of purported facts in the proposed finding in contravention of this Court's Order.

Dr. Cote is not qualified to provide expert opinion testimony about the process and timeline for developing a multicancer screening test because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications

on subject of MCED development process and timeline)).

Dr. Cote is not a credible witness, so his opinion does not deserve any weight. Dr. Cote offered opinion testimony in this matter that spans multiple disparate subjects and exceeds his expertise; his trial testimony also contained unsupported claims about his experience related to MCED test development that exceed the information disclosed in his report in violation of this Court's order; and his previous prediction of upstream entry was wrong casting doubt on similar analysis in this case. (*See* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects)).

In addition to Dr. Cote being unqualified and not credible, his opinion about the process and timeline for commercializing an MCED test is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. Therefore, this Court should disregard the proposed finding.

307. Although it is possible that the R&D process may be shortened to add a new cancer type to an existing test because the company has already elected to pursue a mutation or methylation-based approach, the company would still need to pursue new biomarker discovery for the new cancer(s). (Cote Tr. 3787; RX3869 (Cote Expert Report) ¶ 106.)

Response to Finding No. 307

Complaint Counsel objects to the proposed finding because it is misleading, incorrect, and because it improperly cites expert testimony, Dr. Cote is not qualified to offer expert opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is merely taken from Dr. Cote's report and represents his opinion rather than market realities.

The proposed finding is incorrect because it claims that adding a new cancer type to an

existing cancer screening test requires "new biomarker discovery" and "assay development."

[redacted]

[redacted]

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only source of evidence supporting the facts in the proposed finding in contravention of this Court's Order. This Court should disregard this evidence, leaving this finding unsupported.

Dr. Cote is not qualified to provide expert opinion testimony about the process and timeline for developing a multicancer screening test because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)).

Dr. Cote is not a credible witness, so his opinion does not deserve any weight. Dr. Cote offered opinion testimony in this matter that spans multiple disparate subjects and exceeds his expertise; his trial testimony also contained unsupported claims about his experience related to MCED test development that exceed the information disclosed in his report in violation of this Court's order; and his previous prediction of upstream entry was wrong casting doubt on similar analysis in this case. (*See* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects)).

In addition to Dr. Cote being unqualified and not credible, his opinion about the process and timeline for commercializing an MCED test is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. Therefore, this Court should disregard the proposed finding.

308. To date, scientists have not discovered any biomarkers that are "pan cancer", and this is not unexpected given what is understood about the biological drivers of cancer. (Aravanis (Illumina) Tr. 1883, 1896–98; RX3869 (Cote Expert Report) ¶ 106.)

Response to Finding No. 308

Complaint Counsel objects to the proposed finding because it is vague, misleading, relies only on self-serving testimony, and because it improperly cites expert testimony, Dr. Cote is not qualified to provide opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

The proposed finding is vague because it does not explain what "given what is understood about the biological drivers of cancer" means.

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted verbatim from Dr. Cote's report and represents his opinion rather than market realities.

The proposed finding is also misleading because, although Dr. Cote cited no support for this statement in his report (RX3869 (Cote Expert Report) ¶ 106), Respondents now fill in that hole by citing self-serving trial testimony from Illumina executive Alex Aravanis as the primary source for this purported fact. To be clear, *first* Dr. Cote wrote a report that ignored market realities in order to craft a narrative that fit Respondents' case, *then* Respondents generated this testimony on demand since they could not find support in the form of reliable evidence such as ordinary course documents and unbiased witness testimony.

This proposed finding is inherently speculative. For support, Respondents cite only to the self-serving testimony of Illumina executive Alex Aravanis and the paid testimony of Dr. Cote that is uncorroborated by any ordinary course documents or analysis. Given the inherent unreliability of this testimony as well as lack of foundation or explanation for the witnesses' base conjecture, this proposed finding of fact should be disregarded.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only source of evidence supporting the facts in the proposed finding in contravention of this Court's Order. This Court should disregard this evidence, leaving this finding unsupported.

Dr. Cote is not qualified to provide expert opinion testimony about the process and timeline for developing a multicancer screening test because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)).

Dr. Cote is not a credible witness, so his opinion does not deserve any weight. Dr. Cote offered opinion testimony in this matter that spans multiple disparate subjects and exceeds his expertise; his trial testimony also contained unsupported claims about his experience related to MCED test development that exceed the information disclosed in his report in violation of this Court's order; and his previous prediction of upstream entry was wrong casting doubt on similar analysis in this case. (*See* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects)).

In addition to Dr. Cote being unqualified and not credible, his opinion about the process and timeline for commercializing an MCED test is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community.

309. Therefore, even though companies may chance upon one or a few relevant biomarkers for the new cancer type during development of their previous cancer screening test, full biomarker discovery would still be required to identify a panel of biomarkers for the new cancer type(s) to ensure the accuracy, specificity and sensitivity needed for an early cancer

screening test. (Cote Tr. 3787; RX3869 (Cote Expert Report) ¶ 106; *see also* Aravanis (Illumina) Tr. 1883, 1896–98.)

Response to Finding No. 309

Complaint Counsel objects to the proposed finding because it is confusing, vague, misleading, relies only on self-serving testimony, is incorrect, and because it improperly cites expert testimony, Dr. Cote is not qualified to provide opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

The proposed finding is confusing because it begins with "[t]herefore."

The proposed finding is vague because it does not define or explain what is meant by "the accuracy, specificity and sensitivity needed for an early cancer screening test." It is also vague because it does not define "full biomarker discovery."

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted verbatim from Dr. Cote's report and represents his opinion rather than market realities.

The proposed finding is also misleading because, although Dr. Cote cited no support for this statement in his report (RX3869 (Cote Expert Report) ¶ 106), Respondents now fill in that hole by citing self-serving trial testimony from Illumina executive Alex Aravanis as the primary source for this purported fact. To be clear, *first* Dr. Cote wrote a report that ignored market realities in order to craft a narrative that fit Respondents' case, *then* Respondents generated this testimony on demand since they could not find support in the form of reliable evidence such as ordinary course documents and unbiased witness testimony.

This proposed finding is inherently speculative. For support, Respondents cite only to the self-serving testimony of Illumina executive Alex Aravanis and the paid testimony of Dr. Cote that is uncorroborated by any ordinary course documents or analysis. Given the inherent

unreliability of this testimony as well as lack of foundation or explanation for the witnesses' base conjecture, this proposed finding of fact should be disregarded.

The proposed finding is incorrect because it claims that, to add a new cancer type to an existing cancer screening test, "full biomarker discovery would still be required to identify a panel of biomarkers for the new cancer type(s)."

[redacted]

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only source of evidence supporting the facts in the proposed finding in contravention of this Court's Order. This Court should disregard this evidence, leaving this finding unsupported.

Dr. Cote is not qualified to provide expert opinion testimony about the process and timeline for developing a multicancer screening test because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)).

Dr. Cote is not a credible witness, so his opinion does not deserve any weight. Dr. Cote offered opinion testimony in this matter that spans multiple disparate subjects and exceeds his expertise; his trial testimony also contained unsupported claims about his experience related to MCED test development that exceed the information disclosed in his report in violation of this Court's order; and his previous prediction of upstream entry was wrong casting doubt on similar analysis in this case. (*See* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects)).

In addition to Dr. Cote being unqualified and not credible, his opinion about the process and timeline for commercializing an MCED test is unreliable given that his analysis has not been

subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community.

> 309.1 The challenge is multiplied many-fold as the number of cancers under consideration to be screened increases. (RX3869 (Cote Expert Report) ¶ 106; *see also* Aravanis (Illumina) Tr. 1883; 1896–98.)

Response to Finding No. 309.1

Complaint Counsel objects to the proposed finding because it is vague, misleading, relies only on self-serving testimony, is against the weight of the evidence, and because it improperly cites expert testimony, Dr. Cote is not qualified to provide opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

The proposed finding is vague because it does not define or explain what is meant by "the challenge."

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted verbatim from Dr. Cote's report and represents his opinion rather than market realities.

The proposed finding is also misleading because, although Dr. Cote cited no support for this statement in his report (RX3869 (Cote Expert Report) ¶ 106), Respondents now fill in that hole by citing self-serving trial testimony from Illumina executive Alex Aravanis as the primary source for this purported fact. To be clear, *first* Dr. Cote wrote a report that ignored market realities in order to craft a narrative that fit Respondents' case, *then* Respondents generated this testimony on demand since they could not find support in the form of reliable evidence such as ordinary course documents and unbiased witness testimony.

The proposed finding is also misleading because Illumina executive Alex Aravanis actually testified that "the time, you know, *might* be similar for each cancer." (Aravanis

(Illumina) Tr. 1896 (emphasis added)).

This proposed finding is inherently speculative. For support, Respondents cite only to the self-serving testimony of Illumina executive Alex Aravanis and the paid testimony of Dr. Cote that is uncorroborated by any ordinary course documents or analysis. Given the inherent unreliability of this testimony as well as lack of foundation or explanation for the witnesses' base conjecture, this proposed finding of fact should be disregarded.

The proposed finding claim that "the challenge is multiplied many-fold as the number of cancers under consideration to be screened increases" is against the weight of the evidence. [redacted]

[redacted]

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only source of evidence supporting the facts in the proposed finding in contravention of this Court's Order. This Court should disregard this evidence, leaving this finding unsupported.

Dr. Cote is not qualified to provide expert opinion testimony about the process and timeline for developing a multicancer screening test because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)).

Dr. Cote is not a credible witness, so his opinion does not deserve any weight. Dr. Cote offered opinion testimony in this matter that spans multiple disparate subjects and exceeds his expertise; his trial testimony also contained unsupported claims about his experience related to MCED test development that exceed the information disclosed in his report in violation of this Court's order; and his previous prediction of upstream entry was wrong casting doubt on similar analysis in this case. (*See* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility

problems across these subjects)).

In addition to Dr. Cote being unqualified and not credible, his opinion about the process and timeline for commercializing an MCED test is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community.

> 309.2 As Gary Gao of Singlera explained, in ten years, Singlera has only had "enough sample type[s] for five given types of a cancer to validate . . . there are hundreds of different cancer types, and over a ten-year span, you can only collect enough sample for four or five different cancers for validation purpose. So for five different kinds that we can estimate, you know, it may take seven to eight years [to conduct a] prospective trial to have FDA approval. ***For 50 or 100 kinds of cancer, it would take maybe 50 years.*** You know, that's just the reality of it." (Gao (Singlera) Tr. 1883.)

Response to Finding No. 309.2

Complaint Counsel objects to the proposed finding because it is misleading and against the weight of the evidence.

The proposed finding is misleading to the extent it suggests that Singlera's PanSEER test would need to detect 50 types cancer in order to compete with Galleri. There is simply no clinical evidence that Galleri can provide early detection of 50+ cancers in an asymptomatic population. Nor is there clinical evidence that Galleri can provide early detection of 20 cancers in an asymptomatic population, or ten, or even eight. As of trial, Galleri had been clinically shown to detect only seven types of early stage cancer in an asymptomatic screening population – a fact conceded by Respondents' own expert. ((Cote Tr. 4000-4001) ("Q. So as of today, Galleri has been clinically shown to detect seven types of stage one through three cancer in an asymptomatic screening population, correct? A. That's correct."); *see generally* CCFF ¶¶ 6206-6394 (Appendix B: Galleri Has Not Been Clinically Shown to Provide Early Detection of More Than 50 Cancers in an Asymptomatic Population)).

[redacted]

310. After the test developer is satisfied with the biomarkers selected for the assay, the test developer enters the "development" stage and focuses on optimizing the assay across different metrics, including costs, quality control and other performance characteristics. [redacted]

Response to Finding No. 310

[redacted]

[redacted]

[redacted]

310.1 For example, an assay that is interrogating multiple cancer types, or is analyzing multiple analytes may require more time than the assay development stage for a single cancer assay. [redacted]

Response to Finding No. 310.1

[redacted]

310.2 The development stage can take multiple years and also impose a cost of about $50 to $100 million. (Cote Tr. 3786; [redacted]

Response to Finding No. 310.2

[redacted]

[redacted]

[redacted]

2. **Validation/Clinical Studies**

311. After the test developer has completed the initial research and development steps, to support the marketing and reimbursement of a clinical oncology test as either an LDT or IVD test with FDA approval, oncology test developers must perform clinical studies to validate the efficacy of any clinical oncology test in detecting cancer and to identify the cancers that such tests are intended to detect at an early stage. (PX7086 (Cance (ACS) Dep. at 50); [redacted] 3783–3785, [redacted]

Response to Finding No. 311

[redacted]

[redacted]

[redacted]

312. The studies that are required to validate a diagnostic test, and in particular a multi-cancer screening test, are well-established to be the biggest expense incurred by a clinical test developer in pursuing an early cancer screening test. (Cote Tr. 3793–3794, 3806; PX7118 (Fiedler (FMI) Dep. at 71); [redacted] *see also* PX7090 (Sood (Guardant) Dep. at 26–27); [redacted]

Response to Finding No. 312

[redacted]

[redacted]

312.1 For example, FMI's COO states that clinical trials are "extremely expensive" and "in the tens of thousands per patient" (PX7118 (Fiedler (FMI) Dep. at 71); *see also* [redacted]; *see also* PX7090 (Sood (Guardant) Dep. at 26–27).)

Response to Finding No. 312.1

[redacted]

[redacted]

[redacted]

313. While the requirements for an LDT test are likely to be less stringent than would be required for FDA approval, for an LDT to gain traction with relevant stakeholders, it will have to undergo extensive and rigorous clinical validation. (RX3869 (Cote Expert Report) ¶ 108.)

Response to Finding No. 313

Complaint Counsel objects to the proposed finding because it is vague and misleading, it improperly cites expert testimony, Dr. Cote is not qualified to provide opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is unreliable.

The proposed finding is vague regarding what "the requirements for an LDT" refers to. It is also vague because it does not define "relevant stakeholders" or "extensive and rigorous clinical validation."

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted verbatim from Dr. Cote's report and represents his opinion rather than market realities.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only support for the purported facts in the proposed finding in contravention of this Court's Order. This Court should disregard this evidence.

Dr. Cote is not qualified to provide expert opinion testimony about the process and timeline for developing a multicancer screening test because he has no experience developing

such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)).

Dr. Cote is not a credible witness, so his opinion does not deserve any weight. Dr. Cote offered opinion testimony in this matter that spans multiple disparate subjects and exceeds his expertise; his trial testimony also contained unsupported claims about his experience related to MCED test development that exceed the information disclosed in his report in violation of this Court's order; and his previous prediction of upstream entry was wrong casting doubt on similar analysis in this case. (*See* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects)).

In addition to Dr. Cote being unqualified and not credible, his opinion about the process and timeline for commercializing an MCED test is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. Therefore, this Court should disregard the proposed finding.

313.1 [redacted]

Response to Finding No. 313.1

[redacted]

[redacted]

313.2 The American Cancer Society "rel[ies] on published results of those clinical trials to help it establish screening guidelines for MCED tests" (PX7086 (Cance (ACS) Dep. at 36) and "multi-cancer detection tests need more data and validation in order to assist with cancer diagnosis determinations." (PX7086 (Cance (ACS) Dep. at 50); RX3869 (Cote Expert Report) ¶ 108, n.109.)

Response to Finding No. 313.2

[redacted]

[redacted]

[redacted]

314. A test developer may conduct any one of several types of clinical trials in order to launch an LDT test conducted by a CLIA-certified laboratory,. (RX3869 (Cote Expert Report) ¶ 109; *see also* Cote Tr. 3783–85, 3806–07.)

Response to Finding No. 314

Complaint Counsel objects to the proposed finding because it is vague, unsupported, and misleading, it improperly cites expert testimony, Dr. Cote is not qualified to provide opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is unreliable.

The proposed finding is vague regarding what is meant by "any one of several types of clinical trials."

The proposed finding is unsupported because the sources cited do not say anything about the type(s) of clinical trials a developer purportedly may conduct "in order to launch an LDT."

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted nearly verbatim from Dr. Cote's report and represents his opinion rather than market realities.

This Court ordered that experts shall not be cited to "support factual propositions that

should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only support for the purported facts in the proposed finding in contravention of this Court's Order. This Court should disregard this evidence.

Dr. Cote is not qualified to provide expert opinion testimony about the process and timeline for developing a multicancer screening test because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)).

Dr. Cote is not a credible witness, so his opinion does not deserve any weight. Dr. Cote offered opinion testimony in this matter that spans multiple disparate subjects and exceeds his expertise; his trial testimony also contained unsupported claims about his experience related to MCED test development that exceed the information disclosed in his report in violation of this Court's order; and his previous prediction of upstream entry was wrong casting doubt on similar analysis in this case. (*See* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects)).

In addition to Dr. Cote being unqualified and not credible, his opinion about the process and timeline for commercializing an MCED test is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. Therefore, this Court should disregard the proposed finding.

> 314.1 The Centers for Medicare & Medicaid Services (CMS) regulates all laboratory testing (except research) performed on humans in the U.S. through the Clinical Laboratory Improvement Amendments (CLIA) passed by Congress in 1988, which established quality standards for all laboratory testing to ensure the accuracy, reliability and timeliness of patient test results regardless of where the test was performed. (RX3141 (CMS) at 1.)

Response to Finding No. 314.1

Complaint Counsel objects to the proposed finding because it is unsupported and misleading. The source cited (RX3141) does not indicate that CLIA quality standards ensure the "accuracy reliability, and timeliness" of patient test results.

The proposed finding is misleading because Respondents fail to identify Dr. Cote's report as the source from which the proposed finding was copied and pasted verbatim. (RX3869 (Cote Report) ¶ 109 n. 111). Therefore, this Court should disregard the proposed finding.

314.2 Before a clinical laboratory can apply for state licensure to operate, it must first obtain CLIA certification from the CMS and become a CLIA-certified laboratory. (RX3869 (Cote Expert Report) ¶ 109, n.111; *see also* RX3141 (CMS) at 1; RX3912 (CMS).)

Response to Finding No. 314.2

Complaint Counsel objects to the proposed finding because it is confusing and it improperly cites expert testimony.

The proposed finding is confusing regarding what difference if any there is between "obtain[ing] CLIA certification from the CMS" and "become a CLIA-certified laboratory."

The proposed finding is vague because it does not specify how a clinical laboratory would obtain CLIA certification from the CMS.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as support for purported facts in the proposed finding in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

315. Retrospective, case-control study. The simplest of the types of clinical trials is known as a "case-control study." (Cote Tr. 3783–85; PX7086 (Cance (ACS) Dep. at 60–61); RX3869 (Cote Expert Report) ¶ 110.) In the case of the development of a cancer screening test, a study that analyzes specimens (*e.g.*, blood) collected from patients for whom the cancer status

is already known (positive or negative) is "retrospective" because it is backward-looking. (RX3869 (Cote Expert Report) ¶ 110.)

Response to Finding No. 315

Complaint Counsel objects to the proposed finding because it is misleading and against the weight of the evidence, it improperly cites expert testimony, Dr. Cote is not qualified to provide opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is unreliable.

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted nearly verbatim from Dr. Cote's report and represents his opinion rather than market realities.

The proposed finding is also misleading to the extent it suggests that all MCED test developers conduct an identical retrospective case-control study that does not overlap with other test development activities or that all MCED test developers must in general follow an identical, one-size-fits-all, artificial development and commercialization roadmap and timeline that Dr. Cote invented in his flawed analysis.

[redacted]

[redacted]

[redacted]

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only support for purported facts in the proposed finding in contravention of this Court's Order. This Court should disregard this evidence.

Dr. Cote is not qualified to provide expert opinion testimony about the process and timeline for developing a multicancer screening test because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)).

Dr. Cote is not a credible witness, so his opinion does not deserve any weight. Dr. Cote offered opinion testimony in this matter that spans multiple disparate subjects and exceeds his expertise; his trial testimony also contained unsupported claims about his experience related to MCED test development that exceed the information disclosed in his report in violation of this Court's order; and his previous prediction of upstream entry was wrong casting doubt on similar analysis in this case. (*See* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects)).

In addition to Dr. Cote being unqualified and not credible, his opinion about the process and timeline for commercializing an MCED test is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. Therefore, this Court should disregard the proposed finding.

> 315.1 A retrospective, case-controlled cohort study uses pre-collected samples from at least two cohorts of individuals: one with samples from patients diagnosed with the target cancer or cancers, and another with samples from healthy donors who have been "matched" by age or other parameters to the cohort of cancer patient. (PX7086 (Cance (ACS) Dep. at 60–61); RX3869 (Cote Expert Report) ¶ 110.)

Response to Finding No. 315.1

Complaint Counsel objects to the proposed finding because it is misleading, it improperly cites expert testimony, Dr. Cote is not qualified to provide opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is unreliable.

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted verbatim from Dr. Cote's report and represents his opinion rather than market realities.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the support for purported facts in the proposed finding in contravention of this Court's Order. This Court should disregard this evidence.

Dr. Cote is not qualified to provide expert opinion testimony about the process and timeline for developing a multicancer screening test because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)).

Dr. Cote is not a credible witness, so his opinion does not deserve any weight. Dr. Cote

offered opinion testimony in this matter that spans multiple disparate subjects and exceeds his expertise; his trial testimony also contained unsupported claims about his experience related to MCED test development that exceed the information disclosed in his report in violation of this Court's order; and his previous prediction of upstream entry was wrong casting doubt on similar analysis in this case. (*See* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects)).

In addition to Dr. Cote being unqualified and not credible, his opinion about the process and timeline for commercializing an MCED test is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. Therefore, this Court should disregard the proposed finding.

315.2 A case-control study may also have a third cohort of samples from patients diagnosed with non-malignant diseases of the same organ or organs for the relevant cancer types. (RX3869 (Cote Expert Report) ¶ 110.)

Response to Finding No. 315.2

Complaint Counsel objects to the proposed finding because it is misleading, it improperly cites expert testimony, Dr. Cote is not qualified to provide opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is unreliable.

The proposed finding is vague because it refers to a "third cohort" of samples without specifying what the first two cohorts are.

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted verbatim from Dr. Cote's report and represents his opinion rather than market realities.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3.

Here Respondents cite Dr. Cote as the only support for the purported facts in the proposed finding in contravention of this Court's Order. This Court should disregard this evidence.

Dr. Cote is not qualified to provide expert opinion testimony about the process and timeline for developing a multicancer screening test because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)).

Dr. Cote is not a credible witness, so his opinion does not deserve any weight. Dr. Cote offered opinion testimony in this matter that spans multiple disparate subjects and exceeds his expertise; his trial testimony also contained unsupported claims about his experience related to MCED test development that exceed the information disclosed in his report in violation of this Court's order; and his previous prediction of upstream entry was wrong casting doubt on similar analysis in this case. (*See* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects)).

In addition to Dr. Cote being unqualified and not credible, his opinion about the process and timeline for commercializing an MCED test is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. Therefore, this Court should disregard the proposed finding.

> 315.3 There are no specific sample size requirements for such case-control studies. (RX3869 (Cote Expert Report) ¶ 111.) Such studies vary from fewer than 100 samples in each cohort to several thousands of samples in larger studies. (RX3869 (Cote Expert Report) ¶ 111.) Case-control studies range in cost and time from a few months at a cost of less than a million dollars up to a few years at a cost of tens of million dollars. (Cote Tr. 3786; RX3869 (Cote Expert Report) ¶ 111.)

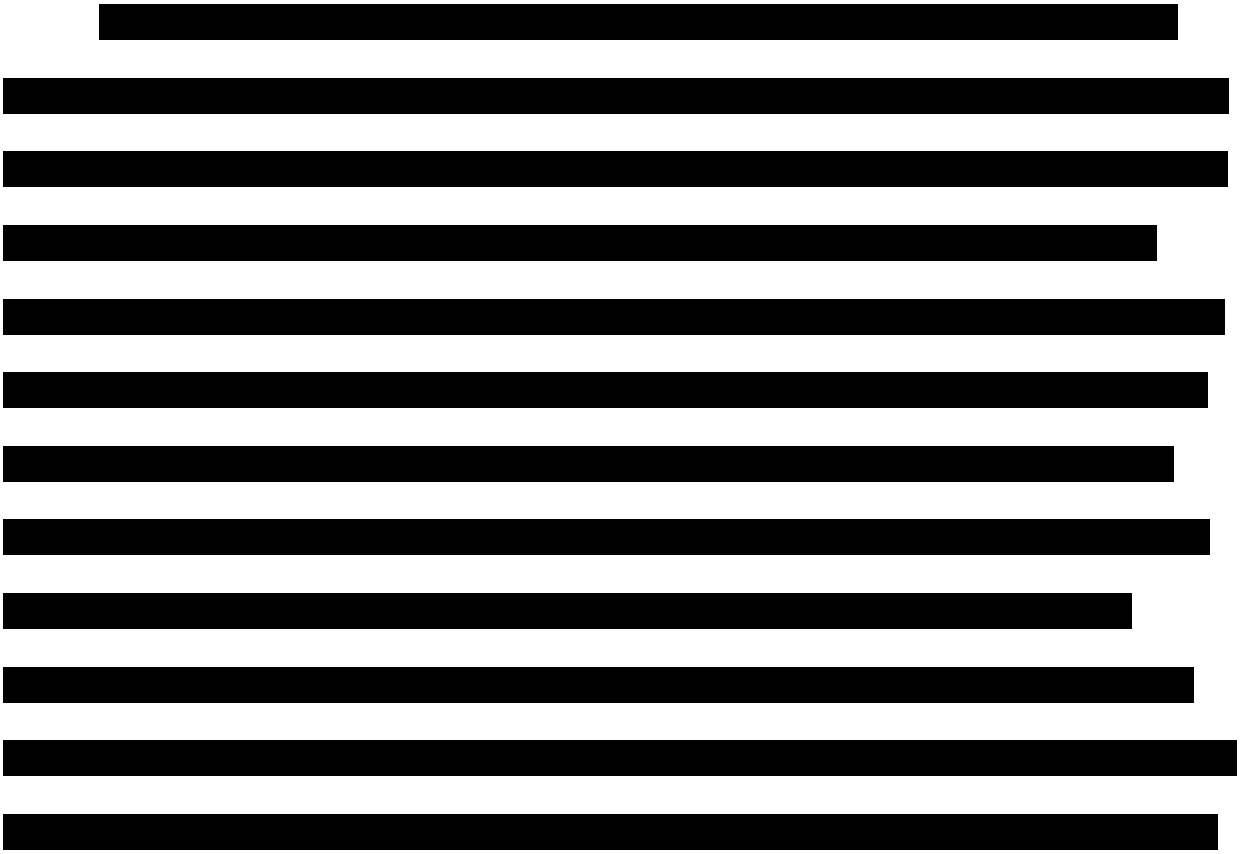
Response to Finding No. 315.3

Complaint Counsel objects to the proposed finding because it is misleading and against

the weight of the evidence, it improperly cites expert testimony, Dr. Cote is not qualified to provide opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is unreliable.

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted verbatim from Dr. Cote's report and represents his opinion rather than market realities.

The proposed finding is also misleading to the extent it suggests that all MCED test developers conduct an identical retrospective case-control study that does not overlap with other test development activities or that all MCED test developers must in general follow an identical, one-size-fits-all, artificial development and commercialization roadmap and timeline that Dr. Cote invented in his flawed analysis.



[redacted]

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only support for the purported facts in the proposed finding in contravention of this Court's Order. This Court should disregard this evidence.

Dr. Cote is not qualified to provide expert opinion testimony about the process and timeline for developing a multicancer screening test because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)).

Dr. Cote is not a credible witness, so his opinion does not deserve any weight. Dr. Cote offered opinion testimony in this matter that spans multiple disparate subjects and exceeds his expertise; his trial testimony also contained unsupported claims about his experience related to MCED test development that exceed the information disclosed in his report in violation of this Court's order; and his previous prediction of upstream entry was wrong casting doubt on similar analysis in this case. (*See* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects)).

In addition to Dr. Cote being unqualified and not credible, his opinion about the process and timeline for commercializing an MCED test is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-

known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. Therefore, this Court should disregard the proposed finding.

315.4 [redacted]

Response to Finding No. 315.4

[redacted]

[redacted]

315.5 A validation study is used to observe, document, and understand variation in the data generated under specific laboratory conditions. (Cote Tr. 3783–85; RX3869 (Cote Expert Report) ¶111, n.115.) Validation helps define the scope or range of conditions under which reliable results may be obtained. (Cote Tr. 3783–85; PX7086 (Cance (ACS) Dep. at 50); [redacted]; RX3869 (Cote Expert Report) ¶111, n.115.)

Response to Finding No. 315.5

[redacted]

[redacted]

[redacted]

316. Prospective, observational study. In contrast to a retrospective study, a study which collects blood from patients who are asymptomatic, and thus have no signs of cancer, and then follows these patients for a period of time to see who develops cancer, is "prospective" or forward-looking. (PX7086 (Cance (ACS) Dep.) at 61–62; Cote Tr. 3783–85.) Participants in a prospective study are enrolled into the study before they develop or are diagnosed with the disease or outcome in question—in the case of cancer screening tests, cancer. (RX3869 (Cote Expert Report) ¶ 112.)

Response to Finding No. 316

Complaint Counsel objects to the proposed finding because it is misleading and against the weight of the evidence, it improperly cites expert testimony, Dr. Cote is not qualified to provide opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is unreliable.

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted nearly verbatim from Dr. Cote's report and represents his opinion rather than market realities.

The proposed finding is also misleading to the extent it suggests that all MCED test developers conduct an identical prospective observational study that does not overlap with other test development activities or that all MCED test developers must in general follow an identical, one-size-fits-all, artificial development and commercialization roadmap and timeline that Dr. Cote invented in his flawed analysis.

[redacted]

[redacted]

[redacted]

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as support for purported facts in the proposed finding in contravention of this Court's Order. This Court should disregard this evidence.

Dr. Cote is not qualified to provide expert opinion testimony about the process and timeline for developing a multicancer screening test because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)).

Dr. Cote is not a credible witness, so his opinion does not deserve any weight. Dr. Cote offered opinion testimony in this matter that spans multiple disparate subjects and exceeds his expertise; his trial testimony also contained unsupported claims about his experience related to MCED test development that exceed the information disclosed in his report in violation of this Court's order; and his previous prediction of upstream entry was wrong casting doubt on similar analysis in this case. (*See* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects)).

In addition to Dr. Cote being unqualified and not credible, his opinion about the process and timeline for commercializing an MCED test is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. Therefore, this Court should disregard the proposed finding.

> 316.1 A study is "observational," where the investigator will not act upon study participants, but instead will observe natural relationships between factors and outcomes. (Cote Tr. 3827–28, 3832; RX3869 (Cote Expert Report) ¶ 113.) In an observational study, the physician overseeing the patient will not be informed of any test results at least until after the study is over. (RX3869 (Cote Expert Report) ¶ 113.)

Response to Finding No. 316.1

Complaint Counsel objects to the proposed finding because it is misleading, it improperly cites expert testimony, Dr. Cote is not qualified to provide opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is unreliable.

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted verbatim from Dr. Cote's report and represents his opinion rather than market realities.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3.

Here Respondents cite Dr. Cote as the only support for the purported facts in the proposed finding in contravention of this Court's Order. This Court should disregard this evidence.

Dr. Cote is not qualified to provide expert opinion testimony about the process and timeline for developing a multicancer screening test because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)).

Dr. Cote is not a credible witness, so his opinion does not deserve any weight. Dr. Cote offered opinion testimony in this matter that spans multiple disparate subjects and exceeds his expertise; his trial testimony also contained unsupported claims about his experience related to MCED test development that exceed the information disclosed in his report in violation of this Court's order; and his previous prediction of upstream entry was wrong casting doubt on similar analysis in this case. (*See* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects)).

In addition to Dr. Cote being unqualified and not credible, his opinion about the process and timeline for commercializing an MCED test is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. Therefore, this Court should disregard the proposed finding.

316.2 In contrast to a retrospective case-control study, [redacted] estimated that a prospective observational study of a potential cancer screening test would require samples from at least 5,000 patients over three years of sample acquisition, from both inside [redacted] and from blood banks, at a cost of about $100 million. {([redacted]

Response to Finding No. 316.2

[redacted]

316.3 However, many prospective observational studies for cancer screening tests have been even bigger. (RX3869 (Cote Expert Report) ¶ 114.)

Response to Finding No. 316.3

[redacted]

[redacted]

316.4 Prospective studies for tests that will analyze multiple cancer types simultaneously are likely to require more samples and more funding correspondingly. (Cote Tr. 3806; RX3869 (Cote Expert Report) ¶ 114.)

Response to Finding No. 316.4

Complaint Counsel objects to the proposed finding because it is vague, misleading, and against the weight of the evidence, it improperly cites expert testimony, Dr. Cote is not qualified to provide opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is unreliable.

The proposed finding is vague because it does not explain the meaning of "more samples and more funding correspondingly."

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted verbatim from Dr. Cote's report and represents his opinion rather than market realities.

The proposed finding is also misleading to the extent it suggests that MCED test developers are in any way behind or not making progress on developing their MCED tests.

[redacted]

- [redacted]
- [redacted]
- [redacted]

- [redacted]
- [redacted]

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only support for the purported fact in the proposed finding in contravention of this Court's Order. This Court should disregard this evidence.

Dr. Cote is not qualified to provide expert opinion testimony about the process and timeline for developing a multicancer screening test because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)).

Dr. Cote is not a credible witness, so his opinion does not deserve any weight. Dr. Cote offered opinion testimony in this matter that spans multiple disparate subjects and exceeds his

expertise; his trial testimony also contained unsupported claims about his experience related to MCED test development that exceed the information disclosed in his report in violation of this Court's order; and his previous prediction of upstream entry was wrong casting doubt on similar analysis in this case. (*See* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects)).

In addition to Dr. Cote being unqualified and not credible, his opinion about the process and timeline for commercializing an MCED test is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. Therefore, this Court should disregard the proposed finding.

317. Prospective, interventional study. A study is "interventional" where the investigator intercedes as part of the study design. (RX3869 (Cote Expert Report) ¶ 115.) In other words, upon a positive finding in a cancer screening study, the physician overseeing the patient will be informed, and is likely to order follow-up tests to rule in or out cancer, and then corresponding treatments if the patient is diagnosed with cancer. (RX3869 (Cote Expert Report) ¶ 115.) The cost of prospective interventional studies is higher than the cost of a prospective observational study. [redacted] 3783–85, 3793–94, [redacted]; RX3869 (Cote Expert Report) ¶ 115.)

Response to Finding No. 317

[redacted]

[redacted]

- [redacted]

- [redacted]

[redacted]

- [redacted]
- [redacted]
- [redacted]

[redacted]

[redacted]

317.1 A study may be called a "longitudinal" study where subjects are followed over time with continuous or repeated monitoring of risk factors or health outcomes, or both. (Gao (Singlera) Tr. 2877–78; RX3869 (Cote Expert Report) ¶ 119, n.123).

Response to Finding No. 317.1

The proposed finding is vague because the terms "over time," "risk factors," and "health

outcomes" are ambiguous. Therefore, this Court should disregard the proposed finding.

> 317.2 A "registrational" trial is where the study is intended (as of the time the first patient is enrolled) to obtain sufficient data and results to support the filing of an application for regulatory approval. (Lengauer (Exact/Thrive) Tr. 170; RX3869 (Cote Expert Report) ¶ 120, n.124.) Depending on the product being tested, a registrational trial is often a randomized, controlled trial, or a prospective, interventional trial. (RX3869 (Cote Expert Report) ¶ 120, n.124.)

Response to Finding No. 317.2

The proposed finding is improper, unreliable, and vague. The second sentence of the proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from a footnote of Dr. Cote's expert report, and Respondents cite no other source to support this portion of the proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 120 n.124; *see* Order on Post-Trial Findings at 3). This Court should disregard the second sentence of Respondents' proposed finding.

Dr. Cote is not qualified to provide expert opinion testimony about the process and timeline for developing a multicancer screening test because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)). In addition, Dr. Cote is not credible (*see* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects), and his opinion about the process and timeline for commercializing an MCED test is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

The proposed finding is vague because the terms "sufficient data and results" and "regulatory approval" are ambiguous. Therefore, this Court should disregard the proposed finding.

> 317.3 For any prospective study, the study size should be big enough to provide sufficient statistical power (with considerations of the associated variabilities) to answer the questions posed by the pre-specified endpoints under investigation, and not too big to avoid exposing participants of unnecessary procedures and treatments and to reduce unnecessary cost. (PX7086 (Cance (ACS) Dep. at 60); Cote Tr. 3806; RX3869 (Cote Expert Report) ¶ 116.)

Response to Finding No. 317.3

The proposed finding is misleading, improper, and vague. Respondents' citation to PX7086, Dr. Cance's deposition, is misleading because Dr. Cance does not provide an opinion on the study size for a prospective study; he specifically states, "that would be a determination between epidemiologists and biostatisticians." (PX7086 (Cance (ACS) Dep. at 60). Dr. Cance does not mention statistical power, associated variabilities, pre-specified endpoints, unnecessary procedures and treatments, or unnecessary cost in the cited testimony.

The only other source that Respondents cite for the proposed finding is Dr. Cote's trial testimony and expert report. Thus, the proposed finding is improper because Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report and his trial testimony to support this proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 116; *see* Order on Post-Trial Findings at 3). And, moreover, the quoted portion of Dr. Cote's report—i.e., the entire proposed finding—does not contain any factual citation at all, as it originally appeared in Dr. Cote's report. (RX3869 (Cote Report) ¶ 116). Respondents improperly rely on Dr. Cote's expert opinions to support this proposed

finding, in contravention of this Court's Order, and otherwise have never provided any evidence to support this proposed finding, either here or in Dr. Cote's report, and therefore this Court should disregard Respondents' proposed finding.

Dr. Cote is not qualified to provide expert opinion testimony about the process and timeline for developing a multicancer screening test because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)). This Court should not accord Dr. Cote's opinion any weight.

The proposed finding is vague because the terms "big enough," "sufficient statistical power," "associated variabilities," and "too big" are ambiguous. Additionally, the term "pre-specific endpoints" is undefined.

318. FDA's requirements for obtaining premarket approval from the FDA may be more stringent than for a test developer to commercialize an LDT: an LDT can be launched by demonstrating results of a case-control study. (Cote Tr. 3824.) FDA is likely to only consider results from well-controlled clinical studies in "a significant portion of the target population" that will demonstrate that the test "will provide clinically significant results." (RX3220 (FDA) at 3; 21 CFR § 860.7.)

Response to Finding No. 318

Complaint Counsel objects to the proposed finding because it is incorrect, unsupported, vague, confusing, misleading, and improperly cites expert testimony.

The proposed finding is incorrect and unsupported because it says the "FDA is likely to only consider results from well-controlled clinical studies in 'a significant portion of the target population." But the FDA publication cited (RX3220) does not say clinical studies must be conducted ***in*** a significant portion of the target population. The publication says there must be "valid scientific evidence, that in a significant portion of the target population, the use of the device … will provide clinically significant results." (RX3220 at 3).

The proposed finding is vague in stating that "an LDT can be launched by demonstrating results of a case-control study" because it does not indicate to whom those results purportedly must be demonstrated.

The proposed finding is confusing and misleading because it suggests some form of FDA approval is required for a test developer to launch an LDT.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as support for purported facts in the proposed finding in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

> 318.1 Specifically, for the FDA to approve a cancer screening test it is likely that the developer of a potential cancer screening test would need to conduct a large, prospective, interventional study in asymptomatic patients. (Cote Tr. 3783–85; [redacted] RX3869 (Cote Expert Report) ¶ 117.)

Response to Finding No. 318.1

[redacted]

319. The FDA has said that "[t]here is reasonable assurance that a device is effective when it can be determined, based upon valid scientific evidence, that in a significant portion of the target population, the use of the device for its intended uses and conditions of use, when accompanied by adequate directions for use and warnings against unsafe use, will provide clinically significant results. The valid scientific evidence used to determine the effectiveness of

a device shall consist principally of well-controlled investigations." (RX3220 (FDA) at 3; 21 CFR § 860.7; RX3869 (Cote Expert Report) ¶ 117, n.120.)

Response to Finding No. 319

Complaint Counsel objects to the proposed finding because it improperly cites expert testimony.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as support for purported facts in the proposed finding in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

320. In other words, for an early cancer screening test, whose target population comprises asymptomatic individuals who do not have a diagnosis of cancer, the clinical study cannot use samples from cancer patients, but will need to collect fresh samples prospectively from a large enough set of individuals to qualify as "a significant portion of the target population." (RX3220 (FDA) at 3; RX3869 (Cote Expert Report) ¶ 118.)

Response to Finding No. 320

Complaint Counsel objects to the proposed finding because it is vague, incorrect, unsupported, and improperly cites expert testimony.

The proposed finding is vague because it is not clear what "[i]n other words" refers to or what "the clinical study" refers to. It is also vague because it does not define "fresh samples."

The proposed finding is incorrect and unsupported because it says "the clinical study … will need to collect … samples … from a large enough set of individuals to qualify as "a significant portion of the target population." But the FDA publication cited (RX3220) does not say clinical studies must be conducted ***in*** a significant portion of the target population. The publication says there must be "valid scientific evidence, that in a significant portion of the target population, the use of the device … will provide clinically significant results." (RX3220 at 3).

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as support for purported facts in the proposed finding in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

321. Because the incidence of cancer in an asymptomatic population is only 4 in 1000 individuals, this means that any proposed study will need to include many thousands of such individuals to provide the opportunity to find diverse cancer types and to have enough patients who will be diagnosed with cancer to be statistically valid. (RX3501 (National Cancer Institute) at 2; RX3869 (Cote Expert Report) ¶ 118.)

Response to Finding No. 321

Complaint Counsel objects to the proposed finding because it is vague, unsupported, it improperly cites expert testimony, Dr. Cote is not qualified to offer expert testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is unreliable.

The proposed finding is vague as to what "any proposed study" refers to, the meaning of "many thousands," and the meaning of "diverse cancer types."

The proposed finding is unsupported because the source cited (RX3501) does not contain any information about clinical studies.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as support for purported facts in the proposed finding in contravention of this Court's Order. This Court should disregard this evidence.

Dr. Cote is not qualified to provide expert opinion testimony about the process and timeline for developing a multicancer screening test because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)).

Dr. Cote is not a credible witness, so his opinion does not deserve any weight. Dr. Cote offered opinion testimony in this matter that spans multiple disparate subjects and exceeds his expertise; his trial testimony also contained unsupported claims about his experience related to MCED test development that exceed the information disclosed in his report in violation of this Court's order; and his previous prediction of upstream entry was wrong casting doubt on similar analysis in this case. (*See* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects)).

In addition to Dr. Cote being unqualified and not credible, his opinion about the process and timeline for commercializing an MCED test is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. Therefore, this Court should disregard the proposed finding

322. Further, the study must be interventional to evaluate whether the early cancer screening test can provide clinically significant results. (Cote Tr. 3783–85, 3793–94, 3804–05; RX3869 (Cote Expert Report) ¶ 118.)

Response to Finding No. 322

Complaint Counsel objects to the proposed finding because it improperly cites expert testimony, Dr. Cote is not qualified to offer expert testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is unreliable.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only source of support for purported facts in the proposed finding in contravention of this Court's Order. This Court should disregard this evidence.

Dr. Cote is not qualified to provide expert opinion testimony about the process and timeline for developing a multicancer screening test because he has no experience developing

such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)).

Dr. Cote is not a credible witness, so his opinion does not deserve any weight. Dr. Cote offered opinion testimony in this matter that spans multiple disparate subjects and exceeds his expertise; his trial testimony also contained unsupported claims about his experience related to MCED test development that exceed the information disclosed in his report in violation of this Court's order; and his previous prediction of upstream entry was wrong casting doubt on similar analysis in this case. (*See* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects)).

In addition to Dr. Cote being unqualified and not credible, his opinion about the process and timeline for commercializing an MCED test is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. Therefore, this Court should disregard the proposed finding

323. In this case, "clinically significant results" will likely include a determination that a higher than expected proportion of the diagnosed cancers are detected at early, potentially curable stage, and may even require follow-up of these patients to determine if early diagnosis and intervention did indeed result in higher than expected cure rates. (RX3869 (Cote Expert Report) ¶ 119).

Response to Finding No. 323

Complaint Counsel objects to the proposed finding because it is vague, it improperly cites expert testimony, Dr. Cote is not qualified to offer expert testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is unreliable.

The proposed finding is vague because it does not define "higher than expected" or explain what that term stands in relation to.

This Court ordered that experts shall not be cited to "support factual propositions that

should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only source of support for purported facts in the proposed finding in contravention of this Court's Order. This Court should disregard this evidence, leaving the proposed finding unsupported.

Dr. Cote is not qualified to provide expert opinion testimony about the process and timeline for developing a multicancer screening test because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)).

Dr. Cote is not a credible witness, so his opinion does not deserve any weight. Dr. Cote offered opinion testimony in this matter that spans multiple disparate subjects and exceeds his expertise; his trial testimony also contained unsupported claims about his experience related to MCED test development that exceed the information disclosed in his report in violation of this Court's order; and his previous prediction of upstream entry was wrong casting doubt on similar analysis in this case. (*See* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects)).

In addition to Dr. Cote being unqualified and not credible, his opinion about the process and timeline for commercializing an MCED test is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. Therefore, this Court should disregard the proposed finding

324. Such clinical studies will take months of planning, one or more years of recruiting participants at multiple sites, testing and analysis of samples, diagnostic follow-up to rule in or out cancer, further therapeutic intervention for those that are diagnosed with cancer, multiple years of follow-ups, and at least multiple hundreds of millions of dollars in cost over a minimum of 5-7 years. (Cote Tr. 3783–85, 3793–94, 3804–05; RX3869 (Cote Expert Report) ¶ 119.)

Response to Finding No. 324

Complaint Counsel objects to the proposed finding because it is misleading and against the weight of the evidence, it improperly cites expert testimony, Dr. Cote is not qualified to offer expert testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is unreliable.

The proposed finding is misleading to the extent it suggests that MCED test developers are in any way behind or not making progress on developing their MCED tests.

325. As a result, completion of successful clinical studies in a population covering the intended use of a cancer screening product is one of the biggest hurdles for an early cancer screening test. (Cote Tr. 3783–85, 3793–94; RX3869 (Cote Expert Report) ¶ 120.)

Response to Finding No. 325

Complaint Counsel objects to the proposed finding because it is vague, misleading, and against the weight of the evidence, it improperly cites expert testimony, Dr. Cote is not qualified to offer expert testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is unreliable.

The proposed finding is vague because it is not clear what "[a]s a result" refers to, and the meaning of "in a population covering" is not clear.

The proposed finding is misleading to the extent it suggests [redacted]

326. Further, the results from a clinical study of a screening test for a single specific cancer cannot be used to support a screening test for a different cancer type or multiple cancer types. (RX3869 (Cote Expert Report) ¶ 121.)

Response to Finding No. 326

Complaint Counsel objects to the proposed finding because it is vague and against the weight of the evidence, and it improperly cites expert testimony, Dr. Cote is not qualified to offer

expert testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is unreliable.

The proposed finding is vague because it begins with "Further." It is also vague because it does not identify the "screening test for a single specific cancer" or the "screening test for a different cancer type or multiple cancer types."

[redacted]

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3.

Here Respondents cite Dr. Cote as the only support for the purported facts in the proposed finding in contravention of this Court's Order. This Court should disregard this evidence.

[redacted]

Dr. Cote is not a credible witness, so his opinion does not deserve any weight. [redacted]

In addition to Dr. Cote being unqualified and not credible, his opinion about the process and timeline for commercializing an MCED test is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. Therefore, this Court should disregard the proposed finding.

> 326.1 For a retrospective, case-control study, only the healthy samples may be re-used to evaluate the efficacy of the new test, because samples from the cancer cohort would not have the new cancer or cancers under investigation. (RX3869 (Cote Expert Report) ¶ 121.)

Response to Finding No. 326.1

Complaint Counsel objects to the proposed finding because it is vague and against the weight of the evidence, and it improperly cites expert testimony, Dr. Cote is not qualified to offer

expert testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is unreliable.

The proposed finding is vague regarding what is meant by "the healthy samples," "re-used," and "the new test." It also does not identify or specify the "new cancer or cancers under investigation."

[redacted]

[redacted]

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3.

Here Respondents cite Dr. Cote as the only support for the purported facts in the proposed finding in contravention of this Court's Order. This Court should disregard this evidence.

[redacted]

Dr. Cote is not a credible witness, so his opinion does not deserve any weight. [redacted]

In addition to Dr. Cote being unqualified and not credible, his opinion about the process and timeline for commercializing an MCED test is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. Therefore, this Court should disregard the proposed finding

> 326.2 As for a prospective, interventional study, the results of an earlier trial on a single cancer cannot be used because the intervention being analyzed for the new cancer types covered by the new screening test will be different from the intervention in the original study. (Cote Tr. 3787; RX3869 (Cote Expert Report) ¶ 121.)

Response to Finding No. 326.2

Complaint Counsel objects to the proposed finding because it is confusing, vague, misleading, and against the weight of the evidence, and it improperly cites expert testimony, Dr.

Cote is not qualified to offer expert testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is unreliable.

The proposed finding is confusing because it begins with "As for a prospective, interventional study."

The proposed finding is vague because does not define what type of "results" it is referring to.

The proposed finding is misleading to the extent it suggests that test developers will be unable to conduct prospective interventional clinical trials on multiple cancers at once. Moreover, it is against the weight of the evidence that, for example, Thrive completed a large interventional study of CancerSEEK involving the multi-cancer screening of 10,000 women called DETECT-A. (Lengauer (Third Rock Ventures) Tr. 163-65; Conroy (Exact) Tr. 1704). DETECT-A was an exploratory prospective interventional study. (Conroy (Exact) Tr. 1703).

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only support for the purported facts in the proposed finding in contravention of this Court's Order. This Court should disregard this evidence.

[redacted]

Dr. Cote is not a credible witness, so his opinion does not deserve any weight. [redacted]

[redacted]

In addition to Dr. Cote being unqualified and not credible, his opinion about the process and timeline for commercializing an MCED test is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. Therefore, this Court should disregard the proposed finding 327. [redacted]

Response to Finding No. 327.1

[redacted]

[redacted]

3. **Addition of a New Cancer to An Existing Test**

328. Even once you have an existing cancer screening test, it does not become easier to add additional cancers. (Cote Tr. 3787; RX3869 (Cote Expert Report) ¶ 123.)

Response to Finding No. 328

Complaint Counsel objects to the proposed finding because it is unsupported, vague, and against the weight of the evidence, and it improperly cites expert testimony, Dr. Cote is not qualified to offer expert testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is unreliable.

The proposed finding is unsupported because the source cited [redacted]

The proposed finding is vague regarding what "even once you have" and "easier" mean.

The proposed finding's claim that "even once you have an existing cancer screening test, it does not become easier to add additional cancers" is against the weight of the evidence. [redacted]

[redacted]

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as support for purported facts in the proposed finding in contravention of this Court's Order. Dr. Cote has no personal knowledge regarding any validation phase Freenome incorporates into its MCED development. This Court should disregard this evidence.

[redacted]

Dr. Cote is not a credible witness, so his opinion does not deserve any weight. [redacted].

In addition to Dr. Cote being unqualified and not credible, his opinion about the process and timeline for commercializing an MCED test is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-

known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. Therefore, this Court should disregard the proposed finding.

328.1 As Dr. Cote testified, going through the majority of the development steps for a single-cancer screening test does not put a cancer screening test developer in a position where they're ahead in developing a cancer screening test for a different cancer:

> The development of biomarkers for a particular cancer will not be adequate for other cancers. While there may be overlap, one still needs to go through all of the [development] steps. If . . . the test developer has made the decision that they've already undergone biomarker discovery with the assay that they have, they still need to go through the case-control verification to determine whether or not the assay has the performance characteristics needed . . . for the new target cancer, and then has to go through a prospective trial depending on which cancer is being targeted.
>
> (Cote Tr. 3787.)

Response to Finding No. 328.1

Complaint Counsel objects to the proposed finding because it is vague, misleading, and against the weight of the evidence, and it improperly cites expert testimony, Dr. Cote is not qualified to offer expert testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is unreliable.

The proposed finding is vague regarding what "the majority of the development steps" and "a position where they're ahead" mean.

The proposed finding is misleading to the extent it suggests that developing a single cancer screening test does not provide a platform on which to efficiently develop a multi-cancer screening test.

The proposed finding is against the weight of the evidence that MCED developers are efficiently developing muti-cancer screening tests in parallel with or building on single-cancer screening tests. [redacted]

[redacted] **a** [redacted]

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3.

Here Respondents cite Dr. Cote as the only support for the purported facts in the proposed finding in contravention of this Court's Order. Dr. Cote has no personal knowledge regarding developing an MCED test in parallel with or building from a single-cancer screening test. This Court should disregard this evidence.

[redacted]

Dr. Cote is not a credible witness, so his opinion does not deserve any weight. [redacted]

In addition to Dr. Cote being unqualified and not credible, his opinion about the process and timeline for commercializing an MCED test is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. Therefore, this Court should disregard the proposed finding

> 328.2 Should the FDA adopt a relaxed approach to additional cancers, it would be a significant retreat from its longstanding practice to only consider studies of "a significant portion of the target population" that will demonstrate that the test "will provide clinically significant results." (RX3220 (FDA) at 3; 21 CFR § 860.7; RX3869 (Cote Expert Report) ¶ 123).

Response to Finding No. 328.2

Complaint Counsel objects to the proposed finding because it is vague, incorrect, unsupported, misleading, and against the weight of the evidence, and it improperly cites expert testimony, Dr. Cote is not qualified to offer expert testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is unreliable.

The proposed finding is vague regarding what "a relaxed approach" means.

The proposed finding is incorrect and unsupported because it says the "FDA is likely to only consider results from well-controlled clinical studies in 'a significant portion of the target population." But the FDA publication cited (RX3220) does not say clinical studies must be conducted ***in*** a significant portion of the target population. The publication says there must be "valid scientific evidence, that in a significant portion of the target population, the use of the device … will provide clinically significant results." (RX3220 at 3).

The proposed finding is misleading to the extent it suggests that developing a single cancer screening test does not provide a platform on which to efficiently develop a multi-cancer screening test.

The proposed finding is against the weight of the evidence that MCED developers are efficiently developing muti-cancer screening tests in parallel with or building on single-cancer screening tests. [redacted]

[redacted]

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only support for the purported facts in the proposed finding in contravention of this Court's Order. Dr. Cote has no personal knowledge regarding developing an MCED test in parallel with or building from a single-cancer screening test. This Court should disregard this evidence.

[redacted]

[redacted]

Dr. Cote is not a credible witness, so his opinion does not deserve any weight. [redacted]

In addition to Dr. Cote being unqualified and not credible, his opinion about the process and timeline for commercializing an MCED test is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. Therefore, this Court should disregard the proposed finding.

329. It would take much longer for a prospective, interventional clinical study to demonstrate the efficacy of the cancer screening test in asymptomatic population, and then for the FDA to approve the LDT test as an IVD test (whether as a single-site or as a distributable kit). (RX3869 (Cote Expert Report) ¶ 124.) The whole process will likely take seven to ten years, at minimum. (RX3869 (Cote Expert Report) ¶ 124).

Response to Finding No. 329

Complaint Counsel objects to the proposed finding because it is confusing, vague, misleading, and against the weight of the evidence, and it improperly cites expert testimony, Dr. Cote is not qualified to offer expert testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is unreliable

The proposed finding is confusing because it says "[i]t would take much longer" but does

not explain longer than what.

The proposed finding is vague as to what "the cancer screening test," "the LDT," and "the whole process" refer to.

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted verbatim from Dr. Cote's report and represents his opinion rather than market realities.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only support for the purported facts in the proposed finding in contravention of this Court's Order. Dr. Cote has no personal knowledge regarding developing an MCED test in parallel with or building from a single-cancer screening test. This Court should disregard this evidence.

[redacted]

Dr. Cote is not a credible witness, so his opinion does not deserve any weight. [redacted]

In addition to Dr. Cote being unqualified and not credible, his opinion about the process and timeline for commercializing an MCED test is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. Therefore, this Court should disregard the proposed finding

H. Exemplary Clinical Oncology Testing Workflow

330. To the extent that a cancer screening test developer uses Illumina's NGS product, the sequencing step is only one part of a multi-step workflow. (Aravanis (Illumina) Tr. 1829–33; Berry (Illumina) Tr. 814–21; RX3869 (Cote Expert Report) ¶ 125.)

Response to Finding No. 330

The proposed finding is misleading, unsupported, vague, and it improperly cites expert testimony, Dr. Cote is not qualified to provide expert opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

The proposed finding is misleading to the extent it implies that NGS sequencing—and in particular Illumina NGS—is not a critical step in MCED testing, upon which other steps are dependent. The proposed finding is against the weight of significant evidence showing that Illumina NGS is a critical upstream input to MCED testing. (*See* CCFF ¶¶ 1019-1211). The proposed finding is also misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted verbatim from Dr. Cote's report and represents his opinion rather than market realities.

The proposed finding is unsupported to the extent that it purports to speak for the workflow of all MCED test developers while relying on the self-serving testimony of Illumina executives Alex Aravanis and Nicole Berry.

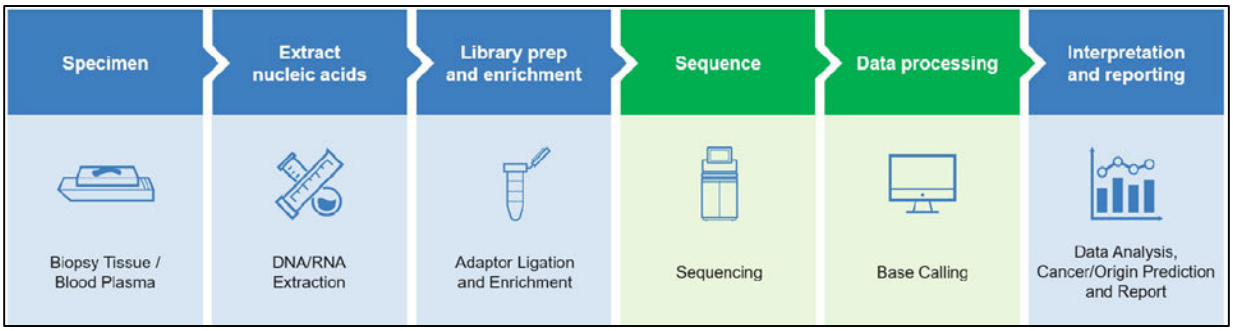
The proposed finding is vague because the term "multi-step workflow" is ambiguous and undefined.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as support for purported facts in the proposed finding in contravention of this Court's Order. Dr. Cote has no personal knowledge regarding developing an MCED test in parallel with or building from a single-cancer screening test. This Court should disregard this evidence.

The proposed finding is unreliable because [redacted] In addition, Dr. Cote is not credible ([redacted]), and his opinion about the workflow for multicancer screening tests is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight. Therefore, this Court should disregard the proposed finding.

331. As shown in the below figure, sequencing comprises only one step in the overall testing workflow. (RX3860 (Cote Expert Report) ¶ 125, Figure 3.)

Figure 4: Testing Workflow



Response to Finding No. 331

The proposed finding is misleading, against the weight of the evidence, improper, unreliable, and vague.

The proposed finding is misleading to the extent it implies that NGS sequencing—and in particular Illumina NGS—is not a critical step in MCED testing, upon which other steps are dependent. The proposed finding is against the weight of significant evidence showing that Illumina NGS is a critical upstream input to MCED testing. (*See* CCFF ¶¶ 1019-1211).

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report to support this proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 126; *see* Order on Post-Trial Findings at 3). And, moreover, the quoted portion of Dr. Cote's report—i.e., the entire proposed finding—does not contain any factual citation at all, as it originally appeared in Dr. Cote's report. (RX3869 (Cote Report) ¶ 126). Respondents improperly rely on Dr. Cote's expert opinions to support this proposed factual finding, in contravention of this Court's Order, . This Court should disregard Respondents' proposed finding.

The proposed finding is unreliable because [redacted]

[redacted] In addition, Dr. Cote is not credible ([redacted]), and his opinion about the workflow for multicancer screening tests is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

The proposed finding is vague because the term "overall testing workflow" is ambiguous and undefined.

332. The steps are (i) specimen collection, (ii) sample preparation (nucleic acid extraction), (iii) library preparation, all of which are involved in preparing the sample, (iv) sequencing, (v) data processing and (vi) data interpretation/reporting. (Aravanis (Illumina) Tr. 1829–1833; Berry (Illumina) Tr. 814–21; RX3869 (Cote Expert Report) ¶ 126.)

Response to Finding No. 332

The proposed finding is misleading, against the weight of the evidence, unsupported, unreliable, and vague.

The proposed finding is misleading to the extent it implies that NGS sequencing—and in particular Illumina NGS—is not a critical step in MCED testing, upon which other steps are dependent. The proposed finding is against the weight of significant evidence showing that Illumina NGS is a critical upstream input to MCED testing. (*See* CCFF ¶¶ 1019-1211).

The proposed finding is unsupported to the extent that it purports to speak for the workflow of all MCED test developers while relying on the self-serving testimony of Illumina executives Alex Aravanis and Nicole Berry.

The only other source that the proposed finding relies on is Dr. Cote's report, from which the entire finding has been copied and pasted verbatim. (RX3869 (Cote Report) ¶ 126). Yet Dr. Cote is not qualified to provide expert opinion testimony [redacted] In addition, Dr. Cote is not credible ([redacted]), and his opinion about the workflow for multicancer screening tests is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

The proposed finding is vague because the terms "specimen collection," "sample preparation," "nucleic acid extraction," and "library preparation" are undefined. Additionally, it is not clear what "the steps" refers to. Therefore, this Court should disregard the proposed finding

333. For any test that uses NGS sequencing, only two of these six steps involve NGS instruments. (RX3869 (Cote Expert Report) ¶ 126; Aravanis (Illumina) Tr. 1829–33; Berry (Illumina) Tr. 814–21.)

Response to Finding No. 333

The proposed finding is misleading, unsupported, vague, and it improperly cites expert testimony, Dr. Cote is not qualified to provide expert opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

The proposed finding is misleading to the extent it implies that NGS sequencing—and in particular Illumina NGS—is not a critical step in MCED testing, upon which other steps are dependent. The proposed finding is against the weight of significant evidence showing that

Illumina NGS is a critical upstream input to MCED testing. (*See* CCFF ¶¶ 1019-1211). The proposed finding is also misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted verbatim from Dr. Cote's report and represents his opinion rather than market realities.

The proposed finding is unsupported to the extent that it purports to speak for the workflow of all MCED test developers while relying on the self-serving testimony of Illumina executives Alex Aravanis and Nicole Berry.

The proposed finding is vague because the term "any test" is ambiguous and undefined.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as support for purported facts in the proposed finding in contravention of this Court's Order. Dr. Cote has no personal knowledge regarding developing an MCED test in parallel with or building from a single-cancer screening test. This Court should disregard this evidence.

The proposed finding is unreliable because Dr. Cote is not qualified to provide expert opinion testimony [redacted] In addition, Dr. Cote is not credible ([redacted]), and his opinion about the workflow for multicancer screening tests is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court

should not accord Dr. Cote's opinion any weight and should disregard the proposed finding

334. *First*, an appropriate sample specimen is collected, such as a tissue biopsy sample, or blood sample for liquid biopsy. (Aravanis (Illumina) Tr. 1829–30; Berry (Illumina) Tr. 814; RX3869 (Cote Expert Report) ¶ 127.)

Response to Finding No. 334

The proposed finding is unsupported, unreliable, vague, and confusing. The proposed finding is unsupported to the extent that it purports to speak for the workflow of all MCED test developers while relying on the self-serving testimony of Illumina executives Alex Aravanis and Nicole Berry.

The only other source that the proposed finding relies on is Dr. Cote's report, from which the entire finding has been copied and pasted verbatim. (RX3869 (Cote Report) ¶ 127). Yet Dr. Cote is not qualified to provide expert opinion testimony about [redacted]. In addition, Dr. Cote is not credible ([redacted]), and his opinion about the workflow for multicancer screening tests is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

The proposed finding is vague because the term "tissue biopsy" is undefined and the term "appropriate sample specimen" is ambiguous.

The proposed finding is confusing because it begins with "[f]irst" but it is not clear what process it is referring to. Therefore, this Court should disregard the proposed finding

334.1 A blood sample is collected by a phlebotomist. (Aravanis (Illumina) Tr. 1829–30; Berry (Illumina) Tr. 814; RX3869 (Cote Expert Report) ¶ 127.) The samples are stored at low temperature and the relevant portion of the sample, such as the abnormal tissue or blood plasma, is separated for further use. (Aravanis (Illumina) Tr. 1829–30; Berry (Illumina) Tr. 814–20; [redacted]

Response to Finding No. 334.1

[redacted]

[redacted]

335. [redacted]

Aravanis (Illumina) Tr. 1829–30; Berry (Illumina) Tr. 814–20; RX3869 (Cote Expert Report) ¶ 128.)

Response to Finding No. 335

[redacted]

Response to Finding No. 335.1

[redacted]

335.2 This step is commonly referred to as sample preparation, or "sample prep," which is performed by a trained lab technician, and takes about 1 to 2 hours. [redacted] Aravanis (Illumina) Tr. 1829–30; Berry (Illumina) Tr. 814.)

Response to Finding No. 335.2

[redacted]

[redacted]

336. *Third*, the purified nucleic acids undergo library preparation. (Aravanis (Illumina) Tr. 1830–31; Berry (Illumina) Tr. 815–25; RX3869 (Cote Expert Report) ¶ 129.) Library preparation processes are proprietary to assay developers and are used to transform the purified nucleic acids into a library of DNA/RNA fragments that is capable of being sequenced using a sequencing instrument. (RX3869 (Cote Expert Report) ¶ 129; Aravanis (Illumina) Tr. 1830–31; Berry (Illumina) Tr. 815–25).

Response to Finding No. 336

The proposed finding is unsupported, unreliable, misleading, and vague. The proposed finding is unsupported to the extent that it purports to speak for the workflow of all MCED test developers while relying on the self-serving testimony of Illumina executives Alex Aravanis and Nicole Berry.

The only other source that the proposed finding relies on is Dr. Cote's expert report, from which the entire finding has been copied and pasted verbatim. (RX3869 (Cote Report) ¶ 129). Yet Dr. Cote is not qualified to provide expert opinion testimony about [redacted]. In addition, Dr. Cote is not credible ([redacted]), and his opinion about the workflow for multicancer screening tests is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by

any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

The proposed finding is misleading to the extent that it suggests MCED test developers all must follow a uniform library preparation workflow. As Illumina executive Nicole Berry testified at trial, library preparation "is very unique and specific to the particular test provider's sort of approach or methodology to how they actually look at the DNA or RNA and then derive information from it, and so in the context of a multicancer screening assay, you know, GRAIL's approach would follow one particular library preparation method or approach and another player in the space would probably use a totally different one." (Berry (Illumina) Tr. 815).

The proposed finding is vague because the terms "purified nucleic acids" and "assay developers" are undefined. Therefore, this Court should disregard the proposed finding.

> 336.1 For short-read sequencers, the DNA/RNA is first fragmented into pieces comprising a length that is suitable for the read-length of the sequencer. (Aravanis (Illumina) Tr. 1830–31; RX3869 (Cote Expert Report) ¶ 129; Berry (Illumina) Tr. 815–25.)

Response to Finding No. 336.1

The proposed finding is misleading, against the weight of the evidence, unsupported, unreliable, and vague.

The proposed finding is misleading to the extent it suggests that MCED testing can be performed on long-read next generation sequencers. The proposed finding is against the weight of significant evidence showing that long-read next generation sequencers are not an option for MCED testing. (*See* CCFF ¶¶ 1346-98).

The proposed finding is also misleading to the extent that it suggests MCED test developers all must follow a uniform library preparation workflow. As Illumina executive

Nicole Berry testified at trial, library preparation "is very unique and specific to the particular test provider's sort of approach or methodology to how they actually look at the DNA or RNA and then derive information from it, and so in the context of a multicancer screening assay, you know, GRAIL's approach would follow one particular library preparation method or approach and another player in the space would probably use a totally different one." (Berry (Illumina) Tr. 815).

The proposed finding is unsupported to the extent that it purports to speak for the workflow of all MCED test developers while relying on the self-serving testimony of Illumina executives Alex Aravanis and Nicole Berry.

The only other source that the proposed finding relies on is Dr. Cote's expert report, from which the entire finding has been copied and pasted verbatim. (RX3869 (Cote Report) ¶ 129). Yet Dr. Cote is not qualified to provide expert opinion testimony about [redacted] In addition, Dr. Cote is not credible ([redacted]), and his opinion about the workflow for multicancer screening tests is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

The proposed finding is vague because the terms "short-read sequencers" and "read-length" are undefined. Therefore, this Court should disregard the proposed finding.

336.2 Then adaptors suitable for the NGS sequencer, which are either included as part of the proprietary library preparation kit or purchased from one of many providers, are added (*i.e.*, ligated) to the end of the fragmented DNA. (Aravanis (Illumina) Tr. 1830–1831; RX3869 (Cote Expert Report) ¶ 129; Berry (Illumina) Tr. 815–25; PX0091 (Illumina) at 14.)

Response to Finding No. 336.2

The proposed finding is misleading, unsupported, vague and it improperly cites expert testimony, Dr. Cote is not qualified to offer opinion testimony on this subject, and Dr. Cote's opinion is not reliable.

The proposed finding is misleading to the extent that it suggests MCED test developers all must follow a uniform library preparation workflow. As Illumina executive Nicole Berry testified at trial, library preparation "is very unique and specific to the particular test provider's sort of approach or methodology to how they actually look at the DNA or RNA and then derive information from it, and so in the context of a multicancer screening assay, you know, GRAIL's approach would follow one particular library preparation method or approach and another player in the space would probably use a totally different one." (Berry (Illumina) Tr. 815).

The proposed finding is unsupported to the extent that it purports to speak for the workflow of all MCED test developers while relying on the self-serving testimony of Illumina executives Alex Aravanis and Nicole Berry.

The proposed finding is vague because it does not define "adaptors" or explain what "suitable for the NGS sequencer" means.

The only other source that the proposed finding relies on is Dr. Cote's expert report, from which the entire finding has been copied and pasted verbatim. (RX3869 (Cote Report) ¶ 129). This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as support for purported facts in the proposed finding in contravention

of this Court's Order. Dr. Cote has no personal knowledge regarding the workflow of any MCED test. This Court should disregard this evidence.

Moreover, Dr. Cote is not qualified to provide expert opinion testimony about [redacted] In addition, Dr. Cote is not credible ([redacted]), and his opinion about the workflow for multicancer screening tests is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight and should disregard the proposed finding.

> 336.3 For short-read sequencers, the ligated DNA is typically amplified using PCR, using the adaptor sequence as primers. (RX3869 (Cote Expert Report) ¶ 129; Cote Tr. 3743–3756; Aravanis (Illumina) Tr. 1830–31; Berry (Illumina) Tr. 815–25.)

Response to Finding No. 336.3

The proposed finding is misleading and unsupported, and it improperly cites expert testimony, Dr. Cote is not qualified to offer opinion testimony on this subject, and Dr. Cote's opinion is not reliable.

The proposed finding is misleading to the extent it suggests that MCED testing can be performed on long-read next generation sequencers. The proposed finding is against the weight of significant evidence showing that long-read next generation sequencers are not an option for MCED testing. (*See* CCFF ¶¶ 1346-98).

The proposed finding is also misleading to the extent that it suggests MCED test developers all must follow a uniform library preparation workflow. As Illumina executive

Nicole Berry testified at trial, library preparation "is very unique and specific to the particular test provider's sort of approach or methodology to how they actually look at the DNA or RNA and then derive information from it, and so in the context of a multicancer screening assay, you know, GRAIL's approach would follow one particular library preparation method or approach and another player in the space would probably use a totally different one." (Berry (Illumina) Tr. 815).

The proposed finding is unsupported to the extent that it purports to speak for the workflow of all MCED test developers while relying on the self-serving testimony of Illumina executives Alex Aravanis and Nicole Berry.

The only other source that the proposed finding relies on is Dr. Cote's expert report, from which the entire finding has been copied and pasted verbatim. (RX3869 (Cote Report) ¶ 129). This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as support for purported facts in the proposed finding in contravention of this Court's Order. Dr. Cote has no personal knowledge regarding the workflow of any MCED test. This Court should disregard this evidence.

Moreover, Dr. Cote is not qualified to provide expert opinion testimony about [redacted]). In addition, Dr. Cote is not credible ([redacted]), and his opinion about the workflow for multicancer screening tests is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed

publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight and should disregard the proposed finding.

> 336.4 The adaptor-ligated (and amplified for short-read sequencers) samples are called sequence "libraries." (PX0091 (Illumina) at 14; RX3869 (Cote Expert Report) ¶ 129.)

Response to Finding No. 336.4

The proposed finding is misleading and vague. It is misleading to the extent that it suggests MCED test developers all must follow a uniform library preparation workflow. As Illumina executive Nicole Berry testified at trial, library preparation "is very unique and specific to the particular test provider's sort of approach or methodology to how they actually look at the DNA or RNA and then derive information from it, and so in the context of a multicancer screening assay, you know, GRAIL's approach would follow one particular library preparation method or approach and another player in the space would probably use a totally different one." (Berry (Illumina) Tr. 815).

The proposed finding is vague because the term "adaptor-ligated" is undefined and the term "amplified" is ambiguous. Therefore, this Court should disregard the proposed finding.

> 336.5 This step is commonly referred to as library preparation, or "library prep," which is performed by a trained lab technician and takes about 2.5 hours for DNA library prep and about 5.5 hours for RNA library prep. (RX3869 (Cote Expert Report) ¶ 129; Aravanis (Illumina) Tr. 1830–31; Berry (Illumina) Tr. 815–25; PX0091 (Illumina) at 14.)

Response to Finding No. 336.5

The proposed finding is unsupported, unreliable, misleading, and vague. PX0091 and the trial testimony of Mr. Aravanis and Ms. Berry no support for the claim that library preparation is performed by a trained lab technician and takes about 2.5 hours for DNA and about 5.5 hours for RNA. PX0091, Mr. Aravanis, and Ms. Berry to do not identify who performs the library

preparation step or how long this step takes. The source that Respondents rely on for this information is Dr. Cote's expert report, from which the entire finding has been copied and pasted verbatim. (RX3869 (Cote Report) ¶ 129).

Dr. Cote is not qualified to provide expert opinion testimony about [redacted] In addition, Dr. Cote is not credible ([redacted]), and his opinion about the workflow for multicancer screening tests is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

The proposed finding is misleading to the extent that it suggests MCED test developers all must follow a uniform library preparation workflow. As Illumina executive Nicole Berry testified at trial, library preparation "is very unique and specific to the particular test provider's sort of approach or methodology to how they actually look at the DNA or RNA and then derive information from it, and so in the context of a multicancer screening assay, you know, GRAIL's approach would follow one particular library preparation method or approach and another player in the space would probably use a totally different one." (Berry (Illumina) Tr. 815).

The proposed finding is vague because the opening phrase "this step" is ambiguous. Therefore, this Court should disregard the proposed finding.

337. *Fourth*, the DNA libraries are sequenced using the NGS sequencers. (RX3869 (Cote Expert Report) ¶ 130; PX0091 (Illumina) at 14; Aravanis (Illumina) Tr. 1831.) This

sequencing step is commonly automated by the sequencer and the sequencing time varies significantly between sequencers. (RX3869 (Cote Expert Report) ¶ 130; Aravanis (Illumina) Tr. 1831.)

Response to Finding No. 337

The proposed finding is unsupported, unreliable, and vague. The second sentence of proposed finding is unsupported to the extent that it purports to speak for the workflow of all MCED test developers while relying on the self-serving testimony of Illumina executive Alex Aravanis.

The only other source that Respondents rely on for this portion of the proposed finding is Dr. Cote's expert report, from which the entire finding has been copied and pasted verbatim. (RX3869 (Cote Report) ¶ 130). Yet Dr. Cote is not qualified to provide expert opinion testimony about [redacted] In addition, Dr. Cote is not credible ([redacted]), and his opinion about the workflow for multicancer screening tests is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

The proposed finding is vague because the phrase "varies significantly" is ambiguous. It is also vague in that "the NGS sequencers" are not identified. Therefore, this Court should disregard the proposed finding.

337.1 For example, Thermo Fisher's Ion GeneStudioTM S5 sequencer with Ion 550TM Chip takes about 8.5–11.5 hours, whereas Illumina's NovaSeq 6000 with S4 flow cells takes about 45 hours. (RX3869 (Cote Expert Report) ¶ 130; RX3357 (Illumina) at 6–7; RX3587 (Thermo Fisher) at 1.)

Response to Finding No. 337.1

The proposed finding is misleading, and it improperly cites expert testimony, Dr. Cote is not qualified to offer opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

The proposed finding is misleading because it compares only the run times between the Thermo Fisher Ion Torrent sequencers and Illumina NextSeq and NovaSeq sequencers, divorced from the number of reads, accuracy, and cost of the respective runs. [redacted]

The proposed finding is also misleading to the extent that it suggests MCED test developers all must follow a uniform library preparation workflow. As Illumina executive Nicole Berry testified at trial, library preparation "is very unique and specific to the particular test provider's sort of approach or methodology to how they actually look at the DNA or RNA and then derive information from it, and so in the context of a multicancer screening assay, you know, GRAIL's approach would follow one particular library preparation method or approach and another player in the space would probably use a totally different one." (Berry (Illumina) Tr. 815).

The proposed finding is also misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted verbatim from Dr. Cote's report and represents his opinion rather than market realities.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as support for purported facts in the proposed finding in contravention of this Court's Order. Dr. Cote has no personal knowledge regarding the workflow of any MCED test. This Court should disregard this evidence.

Moreover, Dr. Cote is not qualified to provide expert opinion testimony about [redacted] In addition, Dr. Cote is not credible ([redacted]), and his opinion about the workflow for multicancer screening tests is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight and should disregard the proposed finding.

338. *Fifth*, the data generated by the sequencer (which varies depending on the type of sequencer) is converted into DNA base sequences, *i.e.*, A, G, C, T, and U for bisulfite converted methylated C. (Berry (Illumina) Tr. 816–17; RX3869 (Cote Expert Report) ¶ 131; Aravanis (Illumina) Tr. 1831–33.) This step is called data processing, and is often conducted at the same time or soon after the sequencing step. (RX3869 (Cote Expert Report) ¶ 131; Aravanis (Illumina) Tr. 1831–33; Berry (Illumina) Tr. 816–17).

Response to Finding No. 338

The proposed finding is confusing, unsupported, unreliable, and vague.

The proposed finding is confusing regarding what it means for "data" to be "converted into" DNA base sequences.

The proposed finding is unsupported to the extent that it purports to speak for the

workflow of all MCED test developers while relying on the self-serving testimony of Illumina executives Alex Aravanis and Nicole Berry.

The only other source that Respondents rely on for the proposed finding is Dr. Cote's expert report, from which the entire finding has been copied and pasted verbatim. (RX3869 (Cote Report) ¶ 131). Yet Dr. Cote is not qualified to provide expert opinion testimony about the workflow for multicancer screening tests because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)). In addition, Dr. Cote is not credible (*see* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects), and his opinion about the workflow for multicancer screening tests is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

The proposed finding is vague because the term "bisulfite converted methylated C" is undefined. Therefore, this Court should disregard the proposed finding.

> 338.1 For example, the data may be image information generated by the fluorescent tags or electrical current information generated by the DNA strand passing through the nanopore. (RX3869 (Cote Expert Report) ¶ 131, n.137; Berry (Illumina) Tr. 819–22.)

Response to Finding No. 338.1

The proposed finding is unsupported, unreliable, and vague. The proposed finding is unsupported to the extent that it purports to speak for the workflow of all MCED test developers while relying on the self-serving testimony of Illumina executive Nicole Berry.

The only other source that Respondents rely on for the proposed finding is Dr. Cote's

expert report, from which the entire finding has been copied and pasted verbatim. (RX3869 (Cote Report) ¶ 131 n. 137). Yet Dr. Cote is not qualified to provide expert opinion testimony about the workflow for multicancer screening tests because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)). In addition, Dr. Cote is not credible (*see* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects), and his opinion about the workflow for multicancer screening tests is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

The proposed finding is vague because the opening phrase "for example" is ambiguous. It is unclear what the proposed finding is being provided as an example of. Additionally, the terms "image information," "fluorescent tag," "electrical current information," and "nanopore" are undefined. Therefore, this Court should disregard the proposed finding.

> 338.2 Oxford Nanopore's long-read sequencers can directly detect methylated C and other base modifications because its base-detection sensor is sensitive to such modifications. (RX3869 (Cote Expert Report) ¶ 131, n.138; Cote Tr. 3753; RX3537 (Oxford Nanopore) at 2.)

Response to Finding No. 338.2

The proposed finding is misleading, and it improperly cites expert testimony, Dr. Cote is not qualified to offer opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

[redacted]

[redacted]

The proposed finding is also misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted verbatim from Dr. Cote's report and represents his opinion rather than market realities.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as support for purported facts in the proposed finding in contravention of this Court's Order. Dr. Cote has no personal knowledge regarding the workflow of any MCED test or the use of Oxford Nanopore sequencing. This Court should disregard this evidence.

Moreover, Dr. Cote is not qualified to provide expert opinion testimony about the workflow for multicancer screening tests or how NGS fits into that workflow because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)). In addition, Dr. Cote is not credible (*see* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects), and his opinion about the workflow for multicancer screening tests is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight and should disregard the proposed finding.

339. *Last*, the sequence data is analyzed and interpreted by the software proprietary to the test developer, often driven by artificial intelligence, to classify the samples with genomic changes, epigenomic modifications, chromosomal changes, and RNA fusions, and a report is

generated showing ultimate results of the test. (RX3869 (Cote Expert Report) ¶ 132; Aravanis (Illumina) Tr. 1831–33, 1837; Berry (Illumina) Tr. 817–18.)

Response to Finding No. 339

The proposed finding is vague and misleading, and it improperly cites expert testimony, Dr. Cote is not qualified to offer opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

The proposed finding is vague because it begins with "Last" with no explanation of what that means. The proposed finding is also vague because it does not explain what "software proprietary to the test developer" means. It is also vague because it does not define "genomic changes," "epigentic modifications," "chromosomal changes," or "RNA fusions."

The proposed finding is misleading to the extent that it suggests MCED test developers all must follow a uniform library preparation workflow. As Illumina executive Nicole Berry testified at trial, library preparation "is very unique and specific to the particular test provider's sort of approach or methodology to how they actually look at the DNA or RNA and then derive information from it, and so in the context of a multicancer screening assay, you know, GRAIL's approach would follow one particular library preparation method or approach and another player in the space would probably use a totally different one." (Berry (Illumina) Tr. 815).

The proposed finding is unsupported to the extent that it purports to speak for the workflow of all MCED test developers while relying on the self-serving testimony of Illumina executives Alex Aravanis and Nicole Berry.

The proposed finding is also misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted verbatim from Dr. Cote's report and represents his opinion rather than market realities.

This Court ordered that experts shall not be cited to "support factual propositions that

should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as support for purported facts in the proposed finding in contravention of this Court's Order. Dr. Cote has no personal knowledge regarding the workflow or data analysis of any MCED test. This Court should disregard this evidence.

Moreover, Dr. Cote is not qualified to provide expert opinion testimony about the workflow for multicancer screening tests or how NGS fits into that workflow because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)). In addition, Dr. Cote is not credible (*see* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects), and his opinion about the workflow for multicancer screening tests is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight and should disregard the proposed finding.

> 339.1 This step is called data interpretation and reporting and can take anywhere from an hour to much longer, depending on the application. (RX3869 (Cote Expert Report) ¶ 132; Aravanis (Illumina) Tr. 1831–33, 1837; Berry (Illumina) Tr. 817–18.)

Response to Finding No. 339.1

The proposed finding is unsupported, unreliable, and vague. The proposed finding is unsupported to the extent that it purports to speak for the workflow of all MCED test developers while relying on the self-serving testimony of Illumina executives Alex Aravanis and Nicole Berry.

The only other source that Respondents rely on for the proposed finding is Dr. Cote's expert report, from which the entire finding has been copied and pasted verbatim. (RX3869 (Cote Report) ¶ 132). Yet Dr. Cote is not qualified to provide expert opinion testimony about the

workflow for multicancer screening tests because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)). In addition, Dr. Cote is not credible (*see* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects), and his opinion about the workflow for multicancer screening tests is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

The proposed finding is vague because the phrases "data interpretation and reporting," "this step," and "much longer" are ambiguous. Therefore, this Court should disregard the proposed finding.

III. THE ONCOLOGY TESTING SPACE

A. GRAIL's Galleri Test

1. Overview of GRAIL's Galleri Test

340. GRAIL has developed a multi-cancer screening test, Galleri, that simultaneously screens for over 50 different types of cancers from a single blood sample. (Bishop (GRAIL) Tr. 1373–74; RX0744 (GRAIL) slide 22, 100; RX3869 (Cote Expert Report) ¶ 133.)

Response to Finding No. 340

The proposed finding is incomplete and misleading. There is no clinical evidence that Galleri can provide early detection of over 50 cancers in an asymptomatic population. Nor is there clinical evidence that Galleri can provide early detection of 20 cancers in an asymptomatic population, or ten, or even eight. As of trial, Galleri had been clinically shown to detect only seven types of early stage cancer in an asymptomatic screening population – a fact conceded by Respondents' own expert. ((Cote Tr. 4000-4001) ("Q. So as of today, Galleri has been clinically

shown to detect seven types of stage one through three cancer in an asymptomatic screening population, correct? A. That's correct."); [redacted]).

Respondents seek to conflate the detection of cancer signals among previously diagnosed cancer patients (including many with Stage IV cancer) with the clinically relevant issue of an MCED test's capability to identify early-stage cancers in an asymptomatic screening population. Galleri is being developed (1) as a multi-cancer early detection test (2) for use in screening an asymptomatic population. (*See, e.g.,* RPFF ¶ 342 (stating that Galleri "is designed to detect cancer . . . before a patient ever shows symptoms")). The fact that Galleri can detect signals for certain cancers once those cancers reach Stage IV does not support Galleri's ability to detect those cancers early. (*See, e.g.,* CCFF ¶ 6233). Respondents' own expert conceded that Stage IV cancer "is almost always incurable and will eventually result in the death of the patient." (RX3869 (Cote Rebuttal Report) ¶ 31). Likewise, the fact that Galleri can detect signals for certain cancers among individuals who have already been diagnosed with cancer does not support Galleri's ability to detect those cancers in an asymptomatic screening population. Grail has released results from two clinical studies of Galleri: the CCGA study and the PATHFINDER study. (Aravanis (Illumina) Tr. 1891-92; Cote, Tr. 3993). The CCGA study did not involve a real-world population but rather was a case-control study that assessed Galleri's ability to detect cancer signals in individuals who had already been diagnosed with cancer. (*See* CCFF ¶¶ 6238-6241). Grail's Chief Medical Officer, Dr. Ofman, conceded at trial that the CCGA study did not involve the intended use population for Galleri. (Ofman (Grail) Tr. 3294-95). The authors of the CCGA-3 sub-study – which Respondents rely upon for their 50-cancer

claims – make this point explicitly in their article, cautioning that "CCGA is a case-control study, and as such, is not reflective of performance in a screening population." (RX3409 at 010 (E.A. Klein, et al., Clinical Validation of a Targeted Methylation-Based Multi-Cancer Early Detection Test Using an Independent Validation Set, 9 Annals of Oncology 1167 (2021)). The authors of the CCGA-2 sub-study provide the same caveat about CCGA, stating: "to understand [Galleri's] performance in an asymptomatic screening population will require additional studies" beyond CCGA. (RX3430 at 10 (M.C. Liu, et al., Sensitive and Specific Multi-Cancer Detection and Localization Using Methylation Signatures in Cell-Free DNA, 6 Annals of Oncology 745 (2020)). The only other study of Galleri for which interim results have been released, PATHFINDER, likewise fails to support the notion that Galleri can provide early detection of 50+ cancers in an asymptomatic population. Grail's Chief Medical Officer, Dr. Ofman, acknowledged the challenges associated with generating the clinical evidence necessary to actually support a 50-cancer early screening claim when he admitted: "To find all 50 cancer types in a real-world population would require hundreds of thousands of people, and PATHFINDER was not designed to do that." (RPFF ¶ 398.4 (quoting Ofman (Grail) Tr. 3298). Based on the PATHFINDER study, the Galleri test has been shown to detect seven types of Stage I-III cancer in an asymptomatic screening population. (Cote Tr. 4000-01; RX3041 at 005 (Tomasz Beer, Interim Results of Pathfinder, a Clinical Use Study Using a Methylation-Based Multi-Cancer Early Detection Test, June 4, 2021). Therefore, this Court should disregard the proposed finding.

341. Galleri is the first blood-based multi-cancer early screening test to be offered to asymptomatic patients with no history of cancer and was launched in June 2021 as an LDT. (Bishop (GRAIL) Tr. 1322.)

Response to Finding No. 341

The proposed finding is vague and unsupported. The proposed finding is vague because

the terms "offered" and "launched" are undefined and provided without context. The proposed finding is unsupported because the cited source does not mention anything about Galleri being "the first" blood-based multi-cancer early screening test to be offered to asymptomatic patients with no history of cancer. With respect to Galleri's launch date, Respondents cite only to the testimony of a Grail executive that is uncorroborated by any ordinary course documents or analysis. Complaint Counsel notes that Grail has made multiple, conflicting, statements about when Galleri was launched as an LDT, including [redacted] May 2021 (Della Porta (Grail) Tr. 460), and June 2021 (Ofman (Grail) Tr. 1322). Therefore, this Court should disregard the proposed finding.

342. Galleri is designed to detect cancer through epigenomic analysis of a single blood draw before a patient ever shows symptoms (*e.g.*, lesions, lumps, or other signs of cancer). (RX3869 (Cote Expert Report) ¶ 133; Bishop (GRAIL) Tr. 1319–21; RX3254 (GRAIL).)

Response to Finding No. 342

Complaint Counsel does not disagree that Galleri is designed to detect cancer before a patient is symptomatic or that the Galleri test itself is based on a single blood draw. The proposed finding is incomplete and misleading, however, to the extent it suggests that no further diagnostic work (beyond a "single blood draw") would be necessary to determine the accuracy of a positive cancer signal reported by Galleri. When assessed in a screening setting involving asymptomatic normal-risk participants, 70 percent of positive Galleri results were falsely positive, meaning the test "detected" a signal for cancer among participants who did not have cancer. *See* CCFF ¶ 6292. Additional diagnostic work is necessary for patients with false positive results to confirm that they did not have cancer. Additional diagnostic work is also necessary for patients for whom Galleri returns a true positive. When asked whether Galleri

could "identify the cancer signal of origin just through the blood," Grail's CEO, Hans Bishop clarified that "the appropriate workup associated with that cancer signal of origin" would be required for confirmation, including the use of ultrasound and biopsy. (Bishop (Grail) Tr. 1387). Mr. Bishop testified at trial that some patients may need to undergo a body scan to identify the cancer tissue of origin. (Bishop (Grail) Tr. 1387). [redacted] Respondents' expert, Dr. Richard Cote, testified at trial that a physician may need to perform a targeted follow-up screening test on individuals who take the Galleri test. (Cote Tr. 3802-3803).

343. In clinical studies, Galleri has detected over 50 types of cancers, of which 45 do not currently have a recommended screening procedure in the US. (Bishop (GRAIL) Tr. 1373, 1391; RX3285 (GRAIL) at 1; RX3286 (GRAIL) at 2; RX3287 (GRAIL) at 1)

Response to Finding No. 343

The proposed finding is incomplete and misleading. There is no clinical evidence that Galleri can provide early detection of 50+ cancers in an asymptomatic screening population. Nor is there clinical evidence that Galleri can provide early detection of 20 cancers in an asymptomatic population, or ten, or even eight. As of trial, Galleri had been clinically shown to detect only seven types of early-stage cancer in an asymptomatic screening population – a fact conceded by Respondents' own expert. ((Cote Tr. 4000-4001) ("Q. So as of today, Galleri has been clinically shown to detect seven types of stage one through three cancer in an asymptomatic screening population, correct? A. That's correct."); [redacted]).

Respondents seek to conflate the detection of cancer signals among previously diagnosed cancer patients (including many with Stage IV cancer) with the clinically relevant issue of an MCED test's capability to identify early-stage cancers in an asymptomatic screening population. Galleri is being developed (1) as a multi-cancer early detection test (2) for use in screening an asymptomatic population. (*See, e.g.,* RPFF ¶ 342 (stating that Galleri "is designed to detect cancer . . . before a patient ever shows symptoms")). The proposed finding itself uses the term "screening procedure," confirming that the relevant metric is Galleri's ability to screen for cancers in asymptomatic patients. The fact that Galleri can detect signals for certain cancers once those cancers reach Stage IV does not support Galleri's ability to detect those cancers early. (*See, e.g.,* CCFF ¶ 6233). Respondents' own expert conceded that Stage IV cancer "is almost always incurable and will eventually result in the death of the patient." (RX3869 (Cote Rebuttal Report) ¶ 31). Likewise, the fact that Galleri can detect signals for certain cancers among individuals who have already been diagnosed with cancer does not support Galleri's ability to detect those cancers in an asymptomatic screening population.

Grail has released results from two clinical studies of Galleri: the CCGA study and the PATHFINDER study. (Aravanis (Illumina) Tr. 1891-92; Cote, Tr. 3993). The CCGA study did not involve a real-world population but rather was a case-control study that assessed Galleri's ability to detect cancer signals in individuals who had already been diagnosed with cancer. (*See* CCFF ¶¶ 6238-6241). Grail's Chief Medical Officer, Dr. Ofman, conceded at trial that the CCGA study did not involve the intended use population for Galleri. (Ofman (Grail) Tr. 3294-95). The authors of the CCGA-3 sub-study – which Respondents rely upon for their 50-cancer claims – make this point explicitly in their article, cautioning that "CCGA is a case-control study, and as such, is not reflective of performance in a screening population." (RX3409 at 010

(E.A. Klein, et al., Clinical Validation of a Targeted Methylation-Based Multi-Cancer Early Detection Test Using an Independent Validation Set, 9 Annals of Oncology 1167 (2021)). The authors of the CCGA-2 sub-study provide the same caveat about CCGA, stating: "to understand [Galleri's] performance in an asymptomatic screening population will require additional studies" beyond CCGA. (RX3430 at 10 (M.C. Liu, et al., Sensitive and Specific Multi-Cancer Detection and Localization Using Methylation Signatures in Cell-Free DNA, 6 Annals of Oncology 745 (2020)). The only other study of Galleri for which interim results have been released, PATHFINDER, likewise fails to support the notion that Galleri can provide early detection of 50+ cancers in an asymptomatic population. Grail's Chief Medical Officer, Dr. Ofman, acknowledged the challenges associated with generating the clinical evidence necessary to actually support a 50-cancer early screening claim when he admitted: "To find all 50 cancer types in a real-world population would require hundreds of thousands of people, and PATHFINDER was not designed to do that." (RPFF ¶ 398.4 (quoting Ofman (Grail) Tr. 3298). Based on the PATHFINDER study, the Galleri test has been shown to detect seven types of Stage I-III cancer in an asymptomatic screening population. (Cote Tr. 4000-01; RX3041 at 005 (Tomasz Beer, Interim Results of Pathfinder, a Clinical Use Study Using a Methylation-Based Multi-Cancer Early Detection Test, June 4, 2021).

Finally, Complaint Counsel notes that the proposed finding is unreliable because Respondents cite only the self-serving testimony of a Grail executive and three Grail press releases (RX3285, RX3286, and RX3287) for the proposed finding, rather than the "clinical studies" themselves. Therefore, this Court should disregard the proposed finding.

344. Notably, Galleri has high sensitivity and specificity for forms of cancer that have no routine screening options, are usually detected at late stage and thus are often lethal. (Cote Tr. 3795–96; 3799–3801, RX3114 (Chen et al., 2021 at 1); RX0744 (GRAIL) at slide 60.)

Response to Finding No. 344

The proposed finding is vague and unsupported. The proposed finding is vague because the terms "high sensitivity and specificity," and "usually" are undefined. The proposed finding is unsupported because nowhere in the cited testimony of Dr. Cote does he characterize the sensitivity or specificity of Galleri as "high." RX3114 fails to support the proposed finding. RX3114 is an article by Chen et. al, which references the CCGA study (Liu et al), but is not the actual study reporting results. RX3114 refers vaguely to the specificity and of "targeted methylation analysis" of "multiple [undisclosed] cancer types" in the CCGA study. RX3114 does not characterize the "sensitivity" of Galleri as high; there is no discussion of sensitivity whatsoever in the cited material. The citation to RX0744 also fails to support the proposed finding. The cited slide, part of an internal Grail slide deck, has no discernable connection to proposed finding: the slide does not so much as mention "sensitivity," "specificity," "routine screening options," cancer staging, or lethality rates. Complaint Counsel does not dispute that cancers detected at late stage are frequently lethal.

Grail cannot say today what the sensitivity of its MCED test will be in Galleri's intended use population (*i.e.* in an asymptomatic screening population). The authors of the CCGA-3 sub-study – which Respondents rely upon for their 50-cancer claims – make this point explicitly in their article, cautioning that "CCGA is a case-control study, and as such, is not reflective of performance in a screening population." (RX3409 at 010 (E.A. Klein, et al., Clinical Validation of a Targeted Methylation-Based Multi-Cancer Early Detection Test Using an Independent Validation Set, 9 Annals of Oncology 1167 (2021)). The authors of the CCGA-2 sub-study provide the same caveat about CCGA, stating: "to understand [Galleri's] performance in an asymptomatic screening population will require additional studies" beyond CCGA. (RX3430 at

10 (M.C. Liu, et al., Sensitive and Specific Multi-Cancer Detection and Localization Using Methylation Signatures in Cell-Free DNA, 6 Annals of Oncology 745 (2020)). Grail admits as much itself. [redacted]

345. Unlike certain other cancer screening test developers, who are taking a mutational approach to detecting cancer (including as one type of biomarker in a multiomics approach) (Cote Tr. 3810, 3844, 3852, 3870–71), the Galleri test detects cfDNA shed by cancer cells using a targeted methylation assay. (Bishop (GRAIL) Tr. 1319–21; (Ofman (GRAIL) Tr. 3286–87; [redacted] Specifically, GRAIL looks at regions of the genome for clusters of CpG sites that are methylated or unmethylated. (Bishop (GRAIL) Tr. 1320; RX0744 (GRAIL) at slides 30–40; [redacted]

Response to Finding No. 345

The proposed finding is incorrect, misleading, and against the weight of the evidence to the extent that it implies that Grail "discovered" MCED testing. [redacted]

[redacted] Therefore, this Court should disregard the proposed finding.

345.1 Methylation is a form of epigenomic change: rather than change the code of a DNA molecule, methylation occurs when methyl groups attach to DNA and "affect which genes are turned on and off", which in turn "affects what the cell becomes and how it behaves". (Aravanis (Illumina) Tr. 1882.) Methylation is considered "a hallmark of cancer because they tend to turn tumor suppressor genes off and they tend to turn tumor promoter genes on." (Ofman (GRAIL) Tr. 3286.)

Response to Finding No. 345.1

Complaint Counsel has no specific response to the proposed finding.

345.1.1 As Dr. Alex Aravanis explained, "if you think, for example, of a lung cell versus a liver cell, they have the same DNA in them. That's not different. What's different is the methylation patterns, so the places in the DNA that are methylated or unmethylated, which is this chemical change, is very different even though the underlying DNA is the same. And so this fingerprint really determines . . . what a cell is and what a tissue [is]. There [are] about 30 million methylation sites . . . in the human genome." (Aravanis (Illumina) Tr. 1882.)

Response to Finding No. 345.1.1

Complaint Counsel has no specific response to this proposed finding.

346. GRAIL developed a machine learning algorithm that differentiates abnormal tumor cfDNA methylation patterns from normal cfDNA methylation patterns. (RX3083 (Bryce et al., 2021) at 1; [redacted]

Response to Finding No. 346

Complaint Counsel has no specific response to the proposed finding.

346.1 As Dr. Josh Ofman explained: "[Galleri] looks at over a million of these methylation sites in over a hundred thousand regions of the genome. And so then you take these patterns, and [subjected them] across cancer types and across cancer stages to train a machine learning algorithm to discriminate what is a cancer signal from what is a

noncancer signal. And we made sure that the control group had lots of confounding indications and diseases to create a lot of biological noise so that our classifier was effectively trained and we didn't have models that were overfit. So once you subject these patterns to the machine learning algorithm, it will classify the pattern as either a cancer-like signal or a noncancer signal. And then if a cancer signal gets detected, the patterns then get subjected to a second step, which is another classifier, which looks and weights different features from these patterns to predict the tissue of origin or where this cancer signal came from in the body, so we call it a cancer signal origin or a tissue of origin." (Ofman (GRAIL) Tr. 3287.)

Response to Finding No. 346.1

Complaint Counsel has no specific response to this proposed finding.

347. [redacted]

Response to Finding No. 347

[redacted]

348. To date, GRAIL has developed three versions of Galleri. (Ofman (GRAIL) Tr. 3291–94.)

Response to Finding No. 348

The proposed finding is incorrect and misstates the testimony of Dr. Ofman. Nowhere in the cited record does Dr. Ofman testify that Grail has developed three versions of Galleri. Moreover, this proposed finding is inconsistent with Respondents' Proposed Finding No. 351, which states that Grail "is currently developing a third version of Galleri." (*see* RCPFF ¶ 351). Therefore, this Court should disregard the proposed finding.

349. Version 1 ("v1") of Galleri was used in GRAIL's Circulating Cell-Free Genome Atlas substudy (CCGA2) and the PATHFINDER Study. (Ofman (GRAIL) Tr. 3291–94.)

Response to Finding No. 349

Complaint Counsel does not disagree with the proposed finding.

350. [redacted] RX3869 (Cote Expert Report) ¶ 135.) GRAIL launched v2 of the Galleri test as an LDT in June 2021. (Bishop (GRAIL) Tr. 1322; RX3869 (Cote Expert Report) ¶ 135.)

Response to Finding No. 350

The proposed finding is vague and unsupported.

The second sentence of the proposed finding is vague because the term "launched" is undefined and provided without context. With respect to Galleri's launch date, Respondents cite only to the testimony of a Grail executive and Dr. Cote's report, uncorroborated by any ordinary course documents or analysis. Complaint Counsel notes that Grail has made multiple statements about when Galleri was launched as an LDT, including [redacted] May 2021 (Della Porta (Grail) Tr. 460), and June 2021 (Ofman (Grail) Tr. 1322). In fact, Mr. Bishop testified that there were

practices that had access to Galleri prior to June of 2021. (Bishop (GRAIL) Tr. 1322).

Therefore, this Court should disregard the proposed finding.

351. GRAIL is currently developing a third version of Galleri, which GRAIL intends to submit for FDA approval. (PX7083 (Bishop (GRAIL) Dep. at 204–05); Ofman (GRAIL) Tr. 3301–02.)

Response to Finding No. 351

Complaint Counsel does not disagree with the proposed finding.

351.1 The changes in the third version are geared toward reducing the amount of sequencing that needs to be done in order to lower costs; all of the same biomarkers are being interrogated as in v2, (Ofman (GRAIL) Tr. 3301–02.)

Response to Finding No. 351.1

Complaint Counsel does not disagree with the proposed finding.

352. [redacted] at 14; RX3869 (Cote Expert Report) ¶ 135.)

Response to Finding No. 352

[redacted]

[redacted]

353. [redacted] RX3869 (Cote Expert Report) ¶ 135.)

Response to Finding No. 353

Complaint Counsel does not disagree with the proposed finding.

354. Depending on the type of cancer, Galleri v1 can detect Stage I and Stage II cancers (i.e., its sensitivity) between 18–43% of the time overall, and a sensitivity of 43.9% for all cancer types, at 99.3% specificity. (RX3430 (Liu et al., 2020) at 1; RX0744 (GRAIL) at 54; [redacted] RX3869 (Cote Expert Report) ¶ 136.)

Response to Finding No. 354

The proposed finding is vague, incorrect, and misleading. The proposed finding is vague because the terms "[d]epending on the type of cancer," "can detect," "of the time overall," and "all cancer types" are undefined.

The proposed finding cites to data from Grail's CCGA-2 substudy. The proposed finding is misleading and incorrect to the extent it suggests that reported sensitivities from the CCGA-2 substudy are indicative of how Galleri would actually perform when used in its intended use population (i.e. in an asymptomatic screening population). CCGA did not involve a real-world

population but rather was a case-control study that assessed Galleri's ability to detect cancer signals in individuals who had already been diagnosed with cancer. (*See* CCFF ¶¶ 6238-6241). The authors of the CCGA-2 substudy themselves acknowledge: "to understand [Galleri's] performance in an asymptomatic screening population will require additional studies" beyond CCGA. (RX3430 at 10 (Liu, et al., 2020)). Grail admits as much itself. [redacted]

The proposed finding is also incorrect to the extent it suggests that "sensitivity of 43.9% for all cancer types, at 99.3 specificity" references the sensitivity and specificity of Galleri for Stage I and II cancers specifically in the CCGA-2 substudy. In fact, the 43.9 percent sensitivity number referenced is the reported sensitivity for Stage I-III cancers in the CCGA-2 substudy (not Stages I and II) and the 99.3 percent specificity number referenced is the reported specificity across all cancer stages (not Stages I and II specifically). (*See* RX3430 at 1 (Liu et al., 2020) at 1). Neither RX0744 [redacted] provides specific numbers related to the reported Stage I and II sensitivities or specificities in the CCGA-2 substudy.

Finally, this Court ordered that experts shall not be cited to "support factual propositions

that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote to support factual propositions in contravention of this Court's Order. This Court should disregard the citation to Dr. Cote and the proposed finding.

355. Galleri's current sensitivity rate for v2 of its test (which is the version that is available as an LDT) is 51.5% for all cancer types across stages. (RX3408 (Klein et al., 2021) at 10; RX3869 (Cote Expert Report) ¶ 136.) This includes cancers that have no screening test today, are usually only found at an advanced stage and thus have a high mortality rate. (Cote Tr. 3795–96; 3799–3801; RX3869 (Cote Expert Report) ¶ 136.)

Response to Finding No. 355

The proposed finding is vague, incorrect, misleading, and relies in part on improper expert opinion. The proposed finding is vague because the terms "current," "sensitivity rate," "its test," "all cancer types," "across stages," "screening test," "advanced," and "high" are undefined.

The proposed finding cites to data from Grail's CCGA-3 substudy. The proposed finding is incorrect and misleading to the extent it suggests that reported sensitivities from the CCGA-3 substudy are indicative of the "current" sensitivity of Galleri as an actual "test" that is "available as an LDT." CCGA did not involve a real-world population but rather was a case-control study that assessed Galleri's ability to detect cancer signals in individuals who had already been diagnosed with cancer. (*See* CCFF ¶¶ 6238-6241). Results from CCGA-3 are thus not informative of Galleri's actual performance in its intended use population (i.e. in an asymptomatic screening population). The authors of the CCGA-3 substudy themselves acknowledge that "CCGA is a case-control study, and as such, is not reflective of performance in a screening population." (RX3409 at 010 (E.A. Klein, et al., 2021) (RX3409 is the actual paper by Klein et al on which RX3408 is based). Grail admits as much itself. [redacted]

[redacted]

The proposed finding is also misleading to the extent that, combined with RPFF ¶ 354, it suggests that Galleri's sensitivity at detecting Stage I-II cancers (in the non-representative, non-screening population involved in CCGA) improved from v1 to v2. For Stage I and Stage II cancers, the reported sensitivity of v2 of Galleri actually declined relative to v1 of Galleri. In CCGA-3 the reported sensitivity was 16.8 percent for Stage I cancer (vs. 18 percent for v1 in CCGA-2) and 40.4 percent for Stage II cancer (vs. 43 percent for v1 in CCGA-2). (Compare RX3409 at 009 (E.A. Klein, et al., 2021) with RX3430 at 001 (Liu et al., 2020)).

[redacted] This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote to support factual propositions in contravention of this Court's Order. This Court should disregard the citations to Dr. Cote and the proposed finding.

Complaint Counsel does not disagree that v2 of Galleri is the version that Grail has made available as an LDT.

356. These results suggest that the Galleri test as currently constructed has the ability to save lives by detecting dangerous cancers at an earlier, potentially curable stage. (RX3869 (Cote Expert Report) ¶ 136.)

Response to Finding No. 356

The proposed finding, which consists of language copied and pasted verbatim from Dr. Cote's report, is vague and unreliable. The proposed finding is vague because the terms "these results," "ability," "dangerous," and "earlier" are ambiguous and undefined.

The proposed finding is unreliable because Respondents cite only to the paid testimony of Dr. Cote for support. Dr. Cote is not a credible witness, so his opinion does not deserve any weight. Dr. Cote offered opinion testimony in this matter that spans multiple disparate subjects and exceeds his expertise; his trial testimony also contained unsupported claims about his experience related to MCED test development that exceed the information disclosed in his report in violation of this Court's order; and his previous prediction of upstream entry was wrong casting doubt on similar analysis in this case. (*See* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects)). In addition, Dr. Cote's opinion about the "ability" of the Galleri test "to save lives" is unreliable because Dr. Cote performed no actual analysis to support his opinion. Accordingly, his opinion has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This proposed finding of fact should be disregarded.

357. Galleri's specificity for v2 of its test is 99.5%. (RX3409 (Klein et al., 2021) at 5; RX3408 (Klein et al., 2021 AACR Presentation) at 10; RX0872 (GRAIL) at 9, 13; RX3869 (Cote Expert Report) ¶ 136.)

Response to Finding No. 357

The proposed finding is misleading to the extent it suggests that reported specificity from the CCGA-3 substudy is indicative of the specificity of Galleri as a screening "test" for asymptomatic individuals. CCGA did not involve a real-world population but rather was a case-control study that assessed Galleri's ability to detect cancer signals in individuals who had already been diagnosed with cancer. (*See* CCFF ¶¶ 6238-6241). Results from CCGA-3 are thus not informative of how Galleri would actually perform when used in its intended use population (i.e. in an asymptomatic screening population). The authors of the CCGA-3 substudy themselves acknowledge that "CCGA is a case-control study, and as such, is not reflective of performance in a screening population." (RX3409 at 010 (E.A. Klein, et al., 2021) (RX3409 is the actual paper by Klein et al on which RX3408 is based). Grail admits as much itself. [redacted].

358. At this time, Galleri is not meant as an alternative or replacement to standard cancer screening procedures, but rather as a complement to recommended screenings, designed to detect more cancers earlier while minimizing the harms that may come from a false positive result. (RX0744 (GRAIL) at 76–90; [redacted] RX0867 (Clinical Overview Deck) at 15; PX7086 (Cance (ACS) Dep. at 50–53); [redacted]; RX3869 (Cote Expert Report) ¶ 136.)

Response to Finding No. 358

The proposed finding is vague because the terms "meant" and "standard cancer screening procedures" are not defined and the terms "earlier" and "minimizing" are provided without context. Therefore, this Court should disregard the proposed finding.

359. Because the risk of cancer increases significantly after age 50, GRAIL expects the use of Galleri to be concentrated in an elevated risk population, for example, in individuals over the age of 50, when the risk of cancer increases significantly. (PX0043 (GRAIL) at 5, 110; *see also* PX7083 (Bishop (GRAIL) Dep. at 25); [redacted]

Response to Finding No. 359

The proposed finding is vague because the terms "concentrated" and "elevated risk population" and "significantly" are not defined. Therefore, this Court should disregard the proposed finding. Complaint Counsel does not dispute that the risk of cancer is greater for individuals above the age of 50 relative to individuals below the age of 50.

2. **Galleri Test Workflow**

360. To run the Galleri test, GRAIL's CLIA-certified laboratory follows a multi-step workflow that follows a standard procedure used for many NGS-based tests. (RX3025 (Alexander et al., 2021) at 4; [redacted]

[redacted]

(RX3025 (Alexander et al., 2021) at 4; [redacted]

Response to Finding No. 360

The proposed finding is vague because the terms "standard procedure" and "many NGS-based tests" are undefined. Therefore, this Court should disregard the proposed finding.

361. *First,* Galleri uses a blood biopsy specimen collected from participants. Blood plasma in the specimen is separated from blood cells. (RX3025 (Alexander et al., 2021) at 4; Bishop (GRAIL) Tr. 1375–76; [redacted]

Response to Finding No. 361

Complaint Counsel has no specific response to this proposed finding.

362. *Second*, cfDNA (*i.e.*, the nucleic acids) are isolated through sample preparation by GRAIL. (Bishop (GRAIL) Tr. 1379–80; [redacted]

Response to Finding No. 362

Complaint Counsel has no specific response to this proposed finding.

363. *Third*, the sample undergoes library preparation and enrichment by GRAIL. (Bishop (GRAIL) Tr. 1379–80; [redacted]

Response to Finding No. 363

Complaint Counsel has no specific response to this proposed finding.

363.1 GRAIL fragments the DNA samples into smaller pieces of DNA and adds specialized adapters to both ends of the DNA fragments, which allow the fragments to bind to a flow cell, a surface designed for those DNA fragments to attach to for the purpose of sequencing. (PX7104 (Aravanis (Illumina) Dep. at 117); [redacted]

Response to Finding No. 363.1

Complaint Counsel has no specific response to this proposed finding.

363.2 [redacted]

Response to Finding No. 363.2

Complaint Counsel has no specific response to this proposed finding.

363.3 Like other tests that rely on NGS sequencing, the proprietary steps for GRAIL's test occur in the library prep stage, where GRAIL prepares the samples so that the analytes it seeks to analyze are detected, and at the last phase where GRAIL uses its proprietary algorithm to interpret the base calls that the NGS sequencer has provided. [redacted] Aravanis (Illumina) Tr. 1832–33; [redacted]

Response to Finding No. 363.3

The proposed finding is vague because the terms "other tests that rely on NGS sequencing," "proprietary steps," "library prep stage," "last phase," and "base calls" are undefined and provided without context. Therefore, this Court should disregard the proposed finding.

364. *Fourth*, the prepared sample then is sequenced at GRAIL's laboratory. (Bishop (GRAIL) Tr. 1380; [redacted] GRAIL's laboratory currently uses the Illumina NovaSeq 6000 with an S4 flow cell to process the Galleri assay. (PX7103 (Jamshidi (GRAIL) Dep. at 31); PX7104 (Aravanis (Illumina) Dep. at 168–69); [redacted]

Response to Finding No. 364

Complaint Counsel has no specific response to this proposed finding.

364.1 At this step, the library is loaded onto a flow cell and placed on the sequencer. (Aravanis (Illumina) Tr. 1831; [redacted] The sequencer amplifies the DNA fragments from the sample through "cluster generation," which copies the fragments into millions of copies of single-stranded DNA. (RX0461 (Illumina) at 22–23); [redacted]

Response to Finding No. 364.1

Complaint Counsel has no specific response to this proposed finding.

365. *Fifth*, the sequencer then identifies the nucleotides in the fragments from the sample ("base calling") and gives the predicted accuracy of each base call. (Berry (Illumina) Tr. 819–22; [redacted]

Response to Finding No. 365

Complaint Counsel has no specific response to this proposed finding.

366. *Sixth*, GRAIL uses its proprietary algorithm (*i.e.*, the classifier) to analyze the raw data from the sequencer to identify the presence of cancer and the origin of the cancer signal.

[redacted] Bishop (GRAIL) Tr. 1380; [redacted] GRAIL also prepares a report for the physician to provide the results of the Galleri test. (Bishop (GRAIL) Tr. 1380–22; [redacted]

Response to Finding No. 366

The proposed finding is misleading to the extent it suggests that Galleri necessarily identifies the presence of cancer when cancer is present or necessarily correctly identifies the origin of the cancer signal. Grail cannot say today what the sensitivity of its MCED test will be in Galleri's intended use population (i.e. in an asymptomatic screening population). Similarly, reliable clinical data does not yet exist about how Grail's cancer signal of origin feature would perform in an asymptomatic screening population. Grail's CCGA study did not involve a real-world population, but rather was a case-control study that involved individuals who had already been diagnosed with cancer. (*See* CCFF ¶¶ 6238-6241). Grail's Chief Medical Officer, Dr. Ofman, conceded at trial that the CCGA study did not involve the intended use population for Galleri. (Ofman (Grail) Tr. 3294-95). The authors of the Grail's CCGA-2 and CCGA-3 sub-studies themselves acknowledge that CCGA is not reflective of performance in a screening population. RX3430 at 10 (M.C. Liu, et al., Sensitive and Specific Multi-Cancer Detection and Localization Using Methylation Signatures in Cell-Free DNA, 6 Annals of Oncology 745 (2020) [CCGA-2] ("[T]o understand [Galleri's] performance in an asymptomatic screening population will require additional studies" beyond CCGA.")); (RX3409 at 010 (E.A. Klein, et al., Clinical Validation of a Targeted Methylation-Based Multi-Cancer Early Detection Test Using an Independent Validation Set, 9 Annals of Oncology 1167 (2021) [CCGA-3] ("CCGA is a case-control study, and as such, is not reflective of performance in a screening population.")). Grail's PATHFINDER study was incomplete as of the time of trial and had released only "interim" results. (*See* RPFF ¶ 402; RX3041 at 1 (Grail) (Interim Results of Pathfinder, 2021)). Therefore, this Court should disregard the proposed finding.

367. GRAIL uses a number of suppliers for inputs used in performing the Galleri test. [redacted] RX3869 (Cote Expert Report), Appendix C.)

Response to Finding No. 367

The proposed finding is vague, incomplete, and misleading. The proposed finding is vague because it does not define the terms "a number of supplies" or "inputs." The proposed finding is incomplete and misleading to the extent it suggests that Grail does not rely on Illumina as its sole-source provider for necessary inputs used in performing the Galleri tests. In Grail's Form S-1 filed with the Securities and Exchange Commission, Grail detailed in the "Risk Factors" section, "[w]e rely on Illumina, Inc. as a sole supplier for our next-generation sequencers and associated reagents. . . ." (PX0043 at 011 (Grail 2020 Form S-1); *see also* Bishop (Grail) Tr. 1336). In its Form S-1, Grail also acknowledged, "Any disruption in Illumina's operations or breach of our supply-related agreements would impact our supply chain and laboratory operations as well as our ability to develop and commercialize our products, including Galleri and DAC." (PX5049 at 29 (Grail Form S-1, Sept. 9, 2020)). Therefore, this Court should disregard the proposed finding.

3. **Galleri's Clinical Studies**

368. Since 2016, GRAIL has undertaken four major clinical studies to validate its test, while another clinical study was enrolling participants at the time of trial. (Cote Tr. 3789–94; Ofman (GRAIL) Tr. 3291–94; RX0744 (GRAIL Core Slide Deck) at 46–47; RX3869 (Cote Expert Report) ¶ 138.)

Response to Finding No. 368

The proposed finding is vague because the terms "major," "validate," and "its test" are undefined. Therefore, this Court should disregard the proposed finding.

368.1 These four clinical studies involved combined total of nearly 140,000 participants in North America and the United Kingdom. (RX3430 (Liu et al., 2020) at 3; Ofman (GRAIL) Tr. 3293; RX0744 (GRAIL) at 71; (RX3291 (GRAIL) at 1.)

[redacted]

Response to Finding No. 368.1

The proposed finding is vague, unreliable, incomplete, and improper. The proposed finding is vague because "nearly" is undefined. The proposed finding is unreliable because, other than RX3430, Respondents cite to second-hand accounts for the number of participants in particular studies, rather than to the studies themselves or the actual tallies of participants registered at ClinicalTrials.gov. Complaint Counsel does not disagree that Grail has enrolled over 130,000 participants in clinical studies. (*See* CCFF ¶ 5309). The actual number of participants enrolled in CGA, STRIVE, SUMMIT, and PATHFINDER based on data from ClinicalTrials.gov, however, is less than 135,000. (*See* PX0390 ClinicalTrials.gov Search Results for "Grail," Sept. 23, 2021).

The proposed finding includes an improper demonstrative exhibit. This Court ordered that the parties "not cite to demonstrative exhibits as substantive evidence." *See* Order on Post-Trial Findings at 3. [redacted]

a. Circulating Cell-Free Genome Atlas Study

369. The Circulating Cell-Free Genome Atlas Study ("CCGA"), started in August 2016, is GRAIL's foundational study. (Ofman (GRAIL) Tr. 3291–92; RX3287 (GRAIL) at 2; RX0867 (GRAIL) at 3; [redacted] RX3869 (Cote Expert Report) ¶ 139.)

Response to Finding No. 369

The proposed finding is vague, unreliable, mischaracterizes the testimony of Dr. Ofman, and violates the Court's Order. The proposed finding is vague because the term "foundational" is undefined. The proposed finding mischaracterizes the testimony of Dr. Ofman because Dr. Ofman neither provides a date on which CCGA "started" nor characterizes CCGA as "foundational" in the portion of the transcript cited by Respondents.

The term "foundational" appears in RX3287, which appears to be a Grail press release printed off the internet. This source is unreliable in that it provides neither citation nor context for the claim that CCGA is "foundational." Slide 3 of RX0867, a Grail presentation of unknown purpose, depicts the letters "CCGA" on a timeline under the year 2016. No context is given for this depiction. The proposed source is unreliable.

[redacted]

Respondents mischaracterize RX0744 to the extent they suggest it supports any part of the proposed finding; the pages cited on RX0744 neither provide a date on which CCGA "started" nor characterize CCGA as "foundational."

The only remaining source cited for the proposed finding is the expert report of Dr. Cote. This Court ordered, however, that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote to support factual propositions in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

370. It is a prospective, multicenter (142 sites), case-control, observational study with longitudinal follow-up. (RX3430 (Liu et al., 2020) at 1; Ofman (GRAIL) Tr. 3291–95; [redacted] RX0744 (GRAIL) at 47–48.) It is believed to be the largest case-control study that's been for early detection.. (Ofman (GRAIL) Tr. 3291.)

Response to Finding No. 370

The proposed finding is vague, unreliable, mischaracterizes evidence cited, is misleading, and contravenes the Court's Order on Post-Trial Findings. The proposed finding is vague because the terms "it," "longitudinal," and "early detection" are undefined. The proposed finding is also vague because it fails to disclose who supposedly "believes" "it" to be "the largest case-control study that's been for early detection."

The proposed finding mischaracterizes the evidence cited. Respondents' primary citation for the proposed finding is page 1 of RX3430. To the extent the "it" in the proposed finding refers to the CCGA study, the cited material fails to support the assertion that the study was "multicenter," the number of "sites" associated with the study, the study's status as "observational," or anything to do with "longitudinal follow-up." The proposed finding also mischaracterizes the testimony of Dr. Ofman. To the extent the "it" in the proposed finding refers to the CCGA study, nowhere in the cited portion of the trial transcript does Dr. Ofman assert that the study was "multicenter," testify about the number of "sites" associated with the study, describe the study "observational," or mention anything about "longitudinal follow-up."

[redacted]

[redacted]

371. It involved the collection of de-identified biospecimens (blood and tissue samples) and clinical data from 142 clinical networks in the United States and Canada, involving the enrollment of 15,254 participants and a cost of about $30 million. (RX3430 (Liu et al., 2020) at 3; [redacted] RX3869 (Cote Expert Report) ¶ 139.) Of those participants, 44% did not have a known cancer diagnosis while 56% had a newly diagnosed cancer ranging early to late-stage (Stage I-IV). (RX3430 (Liu et al., 2020) at 3; RX3869 (Cote Expert Report) ¶ 139.)

Response to Finding No. 371

The proposed finding is vague, misleading, and mischaracterizes the cited evidence. The proposed finding is vague because the terms "it," "clinical networks," "involving," "about," and "newly-diagnosed" are undefined.

If "it" in the proposed finding refers to the CCGA study, the proposed finding is misleading to the extent it suggests that the 15,254 participants "enrolled" in CCGA were actually part of the analysis populations of the CCGA-2 and/or CCGA-3 studies. In fact, only 3,087 samples from CCGA enrollment made their way into the final training an analysis in CCGA-2. *See* RX3430 at 005, Figure 3 (Liu et al., 2020). Nephron Healthcare Investment Research explained that "A Significant Number of CCGA Samples Were Excluded from Analysis" in the CCGA-2 sub-study and "the magnitude" of the excluded samples was "surprising." (PX4178 (Grail) at 021 ("Nephron Healthcare Investment Research, Illumina – Downgrade to Sell: In the Search for the Holy GRAIL, We Think ILMN Chose Poorly," Nov. 9, 2020)). The analysis set for the CCGA-3 substudy involved 4,077 participants. *See* RX3409 at 004, Figure 2 (Klein et al., 2021).

The proposed finding mischaracterizes the evidence. The citation to RX3430 does not mention any cost for the study. [redacted]

[redacted] The only remaining source cited for the proposed finding is the expert report of Dr. Cote. This Court ordered, however, that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote to support factual propositions in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

> 371.1 "[F]or cancers where there is no existing screening methodology, those cancers tend to present very late stage in disease, so finding . . . patients with early-stage cancers is very hard and very rare." (Aravanis (Illumina) Tr. 1917–18.) In order to do so, GRAIL had to set up 142 trial sites to find rare examples of individuals with these unscreened cancers at early-stage disease. (Aravanis (Illumina) Tr. 1918.) It was "unprecedented in scale and complexity and cost to do that." (Aravanis (Illumina) Tr. 1918.) Because of this effort, Galleri is able to detect 45 cancer types which have no existing screening methodology. (Aravanis (Illumina) Tr. 1918.)

Response to Finding No. 371.1

Complaint Counsel does not disagree that it is more difficult to detect early-stage cancers than late-stage cancers in screening applications. The remainder of the proposed finding is vague, unreliable, and misleading. The proposed finding is vague because the phrases "very late," "early-stage," "unscreened," "unprecedented," and "because of this effort" are undefined. The proposed finding is unreliable because Respondents cite only to testimony of a party executive uncorroborated by ordinary course documents or analysis.

The proposed finding is unreliable because Dr. Aravanis does not have foundation to speak to the scale, complexity, and cost of the CCGA study relative to other studies conducted by other companies of which he lacks personal knowledge and for which he cites no factual basis.

The proposed finding is also misleading to the extent that it suggests that the cancer arm of the CCGA study was limited to "individuals with . . . early-stage disease." In fact, 44 percent of the participants in the cancer arm of the CCGA-2 study were cancer patients whose cancer had already progressed to Stages III-IV (23 percent of cancer participants had Stage IV cancer), (RX3430 (Grail) at 006-007 (Liu, et. al, 2020) and 42 percent of the participants in the cancer arm of the CCGA-3 study were cancer patients whose cancer had already progressed to Stages III-IV (22 percent of cancer participants had Stage IV cancer). (RX3409 (Grail) at 006, Table 1 (Klein et. al, 2021).

The proposed finding is also misleading to the extent it suggests that there has been any clinical demonstration that Galleri provides early detection of 45 cancer types "which have no existing screening methodology" in a screening setting. There is no clinical evidence that Galleri can provide early detection of 45 cancers in an asymptomatic population. Nor is there clinical evidence that Galleri can provide early detection of 20 cancers in an asymptomatic population, or ten, or even eight. As of trial, Galleri had been clinically shown to detect only seven types of early stage cancer in an asymptomatic screening population – a fact conceded by Respondents' own expert. ((Cote Tr. 4000-4001) ("Q. So as of today, Galleri has been clinically shown to detect seven types of stage one through three cancer in an asymptomatic screening population, correct? A. That's correct."); [redacted]).

Respondents seek to conflate the detection of cancer signals among previously diagnosed cancer patients (including many with Stage IV cancer) with the clinically relevant issue of an MCED test's capability to identify early-stage cancers in an asymptomatic screening population.

Galleri is being developed (1) as a multi-cancer early detection test (2) for use in screening an asymptomatic population. (*See, e.g.,* RPFF ¶ 342 (stating that Galleri "is designed to detect cancer . . . before a patient ever shows symptoms")). The fact that Galleri can detect signals for certain cancers once those cancers reach Stage IV does not support Galleri's ability to detect those cancers early. (*See, e.g.,* CCFF ¶ 6223). Respondents' own expert conceded that Stage IV cancer "is almost always incurable and will eventually result in the death of the patient." (RX3869 (Cote Rebuttal Report) ¶ 31). Likewise, the fact that Galleri can detect signals for certain cancers among individuals who have already been diagnosed with cancer does not support Galleri's ability to detect those cancers in an asymptomatic screening population.

Grail has released results from two clinical studies of Galleri: the CCGA study and the PATHFINDER study. (Aravanis (Illumina) Tr. 1891-92; Cote, Tr. 3993). The CCGA study did not involve a real-world population but rather was a case-control study that assessed Galleri's ability to detect cancer signals in individuals who had already been diagnosed with cancer. (*See* CCFF ¶¶ 6238-6241). Grail's Chief Medical Officer, Dr. Ofman, conceded at trial that the CCGA study did not involve the intended use population for Galleri. (Ofman (Grail) Tr. 3294-95). The authors of the CCGA-3 sub-study – which Respondents rely upon for their 50-cancer claims – make this point explicitly in their article, cautioning that "CCGA is a case-control study, and as such, is not reflective of performance in a screening population." (RX3409 at 010 (E.A. Klein, et al., Clinical Validation of a Targeted Methylation-Based Multi-Cancer Early Detection Test Using an Independent Validation Set, 9 Annals of Oncology 1167 (2021)). The authors of the CCGA-2 sub-study provide the same caveat about CCGA, stating: "to understand [Galleri's] performance in an asymptomatic screening population will require additional studies" beyond CCGA. (RX3430 at 10 (M.C. Liu, et al., Sensitive and Specific Multi-Cancer Detection

and Localization Using Methylation Signatures in Cell-Free DNA, 6 Annals of Oncology 745 (2020)). The only other study of Galleri for which interim results have been released, PATHFINDER, likewise fails to support the notion that Galleri can provide early detection of 50+ cancers in an asymptomatic population. Grail's Chief Medical Officer, Dr. Ofman, acknowledged the challenges associated with generating the clinical evidence necessary to actually support a 50-cancer early screening claim when he admitted: "To find all 50 cancer types in a real-world population would require hundreds of thousands of people, and PATHFINDER was not designed to do that." (RPFF ¶ 398.4 (quoting Ofman (Grail) Tr. 3298). Based on the PATHFINDER study, the Galleri test has been shown to detect seven types of Stage I-III cancer in an asymptomatic screening population. (Cote Tr. 4000-01; RX3041 at 005 (Tomasz Beer, Interim Results of Pathfinder, a Clinical Use Study Using a Methylation-Based Multi-Cancer Early Detection Test, June 4, 2021). With the exception of the proposition that it is more difficult to detect early-stage cancers than late-stage cancers in screening applications, this Court should disregard the proposed finding.

> 371.2 The study was also unique because the samples were prospectively collected. As Dr. Cote explained: "[The] case-control trial was actually prospectively collected, and it was done under a strict protocol for the collection of all of these samples. That makes it unique in terms of the case-control study, and . . . it was designed that way to provide sample collection under circumstances that would be similar to an actual clinical collection of samples. (Cote Tr. 3794–95.)

Response to Finding No. 371.2

The proposed finding is vague, unreliable, incorrect, and misleading. The proposed finding is vague because the terms "unique," "prospectively collected," "strict protocol," "all these samples," and "similar to an actual clinical collection of samples are undefined."

The proposed finding is unreliable because Dr. Aravanis does not have foundation to speak to the uniqueness of the CCGA study procedures relative to other studies conducted by

other companies of which he lacks personal knowledge and for which he cites no factual basis. Indeed, the proposed finding is incorrect to the extent it suggests that the prospective "collection" of samples makes CCGA "unique." [redacted] According to Grail's intelligence, Burning Rock initiated a 14,000-patient prospective clinical study in China for a pan-cancer early detection test. (PX4139 (Grail) at 001 (Email from A. Tosti, Grail, to E. Mann, Grail, May 28, 2020)).

The proposed finding is also misleading to the extent that the reference to the prospective "collection" of samples in CCGA is intended to suggest that CCGA was a true prospective study and/or an interventional study. It was not. As explained in a November 2020 investment research produced from Grail's files, "None of GRAIL's studies represent a truly prospective, real-world study." (PX4178 (Grail) at 025, Nephron Healthcare Investment Research, "Illumina – Downgrade to Sell: In the Search for the Holy GRAIL, We Think ILMN Chose Poorly," Nov. 9, 2020). [redacted] CCGA assessed the ability of Galleri to detect cancer signals in patients who had already been diagnosed with cancer previously. (*See* CCFF ¶¶ 6238-6245). Therefore, this Court should

disregard the proposed finding.

372. GRAIL collected up to 80 mL of blood from each participant, while also collecting tissue samples of the individuals with a known cancer diagnosis. (RX3430 (Liu et al., 2020) at 3; RX3869 (Cote Expert Report) ¶ 139.)

Response to Finding No. 372

Complaint Counsel has no specific response to the proposed finding, but adds for completeness, that tissue samples of individuals with cancer were submitted "when available." (RX3430 at 003 (Liu et al., 2020)).

373. In the CCGA study, GRAIL followed up with its participants for a period of 5 years. (RX0744 (GRAIL) at 48; RX3869 (Cote Expert Report) ¶ 139.)

Response to Finding No. 373

The proposed finding is vague, misleading, and mischaracterizes the evidence. The proposed finding is vague because the term "followed up" is undefined. The proposed finding is misleading because the use of the past tense in the term "followed up" suggests that the follow-up period of the CCGA study has been completed. The citation to Slide 48 of RX0744 as supportive of this notion mischaracterizes the evidence. Slide 48 of RX0744 merely states that the "Study Design" for CCGA involves "Follow-up for 5 years," not that such follow up has been completed. The only other source cited for the proposed finding is the expert report of Dr. Cote. This Court ordered, however, that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote to support factual propositions in contravention of this Court's Order. The Court should disregard this evidence. Indeed, Dr. Cote's only proposed support for his statement appears to be the same underlying document Respondents also cite, which as noted above fails to support the proposed finding. Therefore, this Court should disregard the proposed finding.

374. GRAIL designed the CCGA study to determine if cfDNA sequencing, in combination with machine learning, would be able to (1) detect a large number of cancers at a high enough specificity to be used as an early cancer screening test for the general population, and (2) determine the tissue of origin of detected cancers (an essential tool in determining next-steps once cancer has been detected in a patient). (RX3430 (Liu et al.,. 2020) at 3; Ofman (GRAIL) Tr. 3291–95; [redacted] RX0744 (GRAIL) at 47–48; RX3869 (Cote Expert Report) ¶ 139.)

Response to Finding No. 374

The proposed finding, which consists of language copied and pasted verbatim from Dr. Cote's report, is vague, misleading, mischaracterizes the cited evidence, and contravenes the Court's Order on Post-Trial Findings. The proposed finding is vague because the term "tool" is undefined and its relation to "determin[ing] the tissue of origin of detected cancers" is unclear.

Additionally, Respondents cite the authors of the CCGA-2 study (Liu et al, 2020) for the proposition that the CCGA study was designed to determine if cfDNA sequencing, in combination with machine learning, would be able to (1) detect a large number of cancers at a high enough specificity to be used as an early cancer screening test for the general population." (emphasis added). This statement is misleading and mischaracterizes the evidence. In fact, Liu et al, 2020 state that the CCGA study was designed to determine whether genome-wide cfDNA sequencing in combination with machine learning could detect and localize a large number of cancer types at sufficiently high specificity to be considered for a general population-based cancer screening program." (RX3430 at 3 (emphasis added). Indeed, the authors of the CCGA-2 sub-study explicitly state that: "to understand [Galleri's] performance in an asymptomatic screening population will require additional studies" beyond CCGA. (RX3430 at 10 (M.C. Liu, et al., Sensitive and Specific Multi-Cancer Detection and Localization Using Methylation Signatures in Cell-Free DNA, 6 Annals of Oncology 745 (2020)).

The proposed finding is also misleading and mischaracterizes the evidence to the extent it attributes the vague statement about tissue of origin determination being "an essential tool" to the

authors of the CCGA-2 study. The material cited in RX3430 does not support such a characterization. The proposed finding also mischaracterizes the testimony of Dr. Ofman. Nothing in his cited testimony supports the specific factual propositions in the proposed finding. The proposed finding also mischaracterizes RX0744. The slides cited in RX0744 do not support the specific language of the proposed finding.

[redacted]

The only other source cited for the proposed finding is the actual source from which the proposed finding was copied and pasted verbatim – namely, the expert report of Dr. Cote (Respondents miscite the paragraph as ¶ 139 rather than ¶ 140). This Court ordered, however, that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote to support factual propositions in contravention of this Court's Order. The Court should disregard this evidence and the proposed finding.

375. CCGA is expected to be completed in March 2024; in total, CCGA study will have spanned nearly eight years. (RX0744 (GRAIL) at 47; RX3869 (Cote Expert Report) ¶ 140.)

Response to Finding No. 375

The proposed finding, which consists of language copied and pasted verbatim from Dr. Cote's report, is unsupported to the extent it relies solely on improper expert opinion. Slide 47 of RX0744 states merely that the "expected completion" of CCGA is March 2024. The cited

slide does not mention any study start date or study duration.

The only other source cited for the proposed finding is the expert report of Dr. Cote. This Court ordered, however, that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote to support factual propositions in contravention of this Court's Order. The Court should disregard this evidence and the proposed finding.

Complaint Counsel has no specific response to Respondents' assertion that CCGA is expected to be completed in March 2024.

376. The design of CCGA involves three sub-studies. (Ofman (GRAIL) Tr. 3291–95; RX3869 (Cote Expert Report) ¶ 140.)

Response to Finding No. 376

Complaint Counsel does not disagree with the proposed finding.

377. The first sub-study was designed to discover and differentiate cancer biomarkers, to determine the most effective way to identify multiple cancers and their signal of origin, and train GRAIL's machine learning algorithms to detect those biomarkers. (Ofman (GRAIL) Tr. 3291–94.); RX3410 (Liu et al., 2018) at 1; RX3869 (Cote Expert Report) ¶ 140.)

Response to Finding No. 377

The proposed finding, which consists of language copied and pasted verbatim from Dr. Cote's report, is unsupported, misleading, and mischaracterizes the cited evidence. Dr. Ofman says nothing about cancer signal of origin in the pages of the trial transcript cited. Respondents' attribution of such a statement to him mischaracterizes his testimony and is therefore misleading. RX3410 also fails to support the proposed finding; the source does not state that the first sub-study was designed to determine "the most effective way" to identify multiple cancers and cancer localization. Respondents' citation to RX3410 is thus misleading and mischaracterizes the evidence.

The only other source cited for the proposed finding is the actual source from which the

proposed finding was copied and pasted verbatim – namely, the expert report of Dr. Cote. This Court ordered, however, that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote to support factual propositions in contravention of this Court's Order. The Court should disregard this evidence and the proposed finding.

378. GRAIL then proceeded to "development" in CCGA2, which was designed to perform further analysis, training, and validation of v1 of the Galleri test: specifically, to discover methylation patterns of identified cancer biomarkers associated with known cancer types, and then train and validate a machine-learning classifier to differentiate methylation patterns associated with cancer vs. non-cancer as well as predict the origin of the cancer signal. (Ofman (GRAIL) Tr. 3292; RX3430 (Liu et al., 2020) at 3; RX3869 (Cote Expert Report) ¶ 141.)

Response to Finding No. 378

The proposed finding, which consists of language copied and pasted verbatim from Dr. Cote's report, is vague, unsupported, misleading, and mischaracterizes the stated evidence. The proposed finding is vague because the terms "development," "validation" and "known cancer types" are undefined. The proposed finding mischaracterizes the testimony of Dr. Ofman and is therefore misleading. Nowhere in the portion of the transcript cited does Dr. Ofman state that Grail "proceeded to 'development'" of Galleri in CCGA-2, or anything similar. The proposed finding also mischaracterizes RX3430. On the page cited, the CCGA-2 authors (Liu et al.,) state that "a methylation-based assay was selected for further development in this second sub-study." (RX3430 at 3 (emphasis added)). The proposed finding is unsupported and misleading to the extent it suggests that the CCGA-1 study was not also related to "development." [redacted]

The only other source cited for the proposed finding is the actual source from which the proposed finding was copied and pasted verbatim – namely, the expert report of Dr. Cote. This Court ordered, however, that experts shall not be cited to "support factual propositions that

should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote to support factual propositions in contravention of this Court's Order. The Court should disregard this evidence and the proposed finding.

> 378.1 This training and validation was to demonstrate the feasibility of detecting cancer and predicting signal of origin with minimal false positives. (RX3430 (Liu et al., 2020) at 3; RX0744 (GRAIL) at slide 46; RX3869 (Cote Expert Report) ¶ 141.)

Response to Finding No. 378.1

The proposed finding is vague and mischaracterizes cited evidence. The proposed finding is vague because the term "minimal false positives" and "validation" are not defined. The proposed finding mischaracterizes RX3430, which does not mention "minimal false positives," but instead states merely that CCGA was "designed to determine whether genome-wide cfDNA sequencing in combination with machine learning could detect and localize a large number of cancer types at sufficiently high specificity to be considered for a general population-based cancer screening program." (RX3430 at 3 (emphasis added)).

The proposed finding is also misleading because — like numerous of Respondents' other proposed findings — it is copied and pasted verbatim from Dr. Cote's report, even though Respondents do not quote Dr. Cote, and it represents only his opinion rather than market realities. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote to support factual propositions in contravention of this Court's Order. The Court should disregard this evidence and the proposed finding.

> 379. The third sub-study was designed to further validate the assay for multi-cancer detection and the identification of the cancer signal of origin. (Ofman (GRAIL) Tr. 3292–93; RX3408 (Klein et al., 2021) at 6; RX3869 (Cote Expert Report) ¶ 141.)

Response to Finding No. 379

The proposed finding is vague and incomplete. The proposed finding is vague because

the terms "further validate" and "the assay" are undefined. The proposed finding is incomplete because it omits that the third substudy, CCGA-3, [redacted] Therefore, this Court should disregard the proposed finding.

(i) CCGA1

380. In CCGA1, GRAIL investigated a variety of approaches to determine which approach performed the best for purposes of an early cancer detection test. (Ofman (GRAIL) Tr. 3291–92; RX3869 (Cote Expert Report) ¶ 142.)

Response to Finding No. 380

The proposed finding is vague, unreliable, misleading, against the weight of evidence, and mischaracterizes the testimony of Dr. Ofman. The proposed finding is vague because the terms "investigated," "variety of approaches," "performed the best" and "early cancer detection test" are undefined and provided without context. For example, it is not clear if Respondents are referring to MCED tests specifically or to all cancer detection tests.

The proposed finding mischaracterizes the testimony of Dr. Ofman. Dr. Ofman testified that Grail determined, based on CCGA-1 that methylation patterns were "the strongest and most robust way to detect cancer signals in the blood," not that Grail conducted an investigation to determine the best "approach" to "early cancer detection" generally. (Ofman (Grail) Tr. 3292 (emphasis added)). The proposed finding is also misleading and against the weight of evidence to the extent it suggests that Grail's current methylation-only approach to multi-cancer early detection is superior to approaches by other MCED developers that combine methylation with other approaches, such as proteomics. Grail's decision that methylation was a stronger "approach," on its own, compared to other "approaches" on their own does not imply that methylation is superior to a combination of methylation and other approaches. Indeed, the proposed finding is against the weight of evidence because [redacted]

[redacted]

The proposed finding is also misleading because — like numerous of Respondents' other proposed findings — it is copied and pasted verbatim from Dr. Cote's report, even though Respondents do not quote Dr. Cote, and it represents only his opinion rather than market realities. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote to support factual propositions in contravention of this Court's Order. The Court should disregard this evidence and the proposed finding.

381. CCGA1 focused exclusively on a single analyte, blood, and investigated multiple types of biomarkers, including cancer-derived mutations (single nucleotide variants and small variants), chromosome alterations (copy number and fragment features such as length and endpoint analysis through whole-genome sequencing), and methylation patterns (through whole genome bisulfite sequencing). (Ofman (GRAIL) Tr. 3291–92; RX3430 (Liu et al., 2020) at 1–3; RX3869 (Cote Expert Report) ¶ 142.)

Response to Finding No. 381

Complaint Counsel has no specific response to the proposed finding.

382. Through the CCGA1 sub-study, GRAIL concluded that interrogating genome-wide methylation patterns using bisulfite sequencing outperformed targeted sequencing and whole-genome sequencing approaches to detect cancer-derived mutations or chromosome alterations. (Ofman (GRAIL) Tr. 3291–92; RX3430 (Liu et al., 2020) at 3, 9; RX3410 (Liu et al., 2018) at 1.)

Response to Finding No. 382

The proposed finding, which consists of language copied and pasted verbatim from Dr. Cote's report, is vague and misleading. The proposed finding is vague because the term "outperformed" is undefined. The proposed finding is also misleading to the extent it suggests that Grail's current methylation-only approach to multi-cancer early detection is superior to approaches by other MCED developers that combine methylation with other approaches, such as proteomics. Grail's internal conclusion that interrogating genome-wide methylation patterns using bisulfite sequencing, on its own, "outperformed" other approaches, on their own, does not imply that methylation is superior to a combination of methylation and other approaches. [redacted]

382.1 In other words, GRAIL concluded through the CCGA1 sub-study that interrogating methylation was the best approach for detecting cancer signals and that some regions of the genome and their methylation status were more informative than others with regards to cancer signals. (Ofman (GRAIL) Tr. 3291–92; PX7103 (Jamshidi (GRAIL) Dep. at 60–67; RX3869 (Cote Expert Report) ¶ 142.)

Response to Finding No. 382.1

The proposed finding, which consists of language copied and pasted verbatim from Dr. Cote's report, is vague, unreliable, misleading, against the weight of evidence, mischaracterizes

the testimony of Dr. Ofman, and relies on improper expert opinion. The proposed finding is vague because the terms "best approach" and "detecting cancer signals" are undefined and provided without context. The proposed finding mischaracterizes the testimony of Dr. Ofman. Dr. Ofman testified that Grail determined, based on CCGA-1 that methylation patterns were "the strongest and most robust way to detect cancer signals in the blood," not that Grail conducted an investigation to determine the "best approach" to "early cancer detection" generally. (Ofman (Grail) Tr. 3292 (emphasis added)). The proposed finding is also misleading and against the weight of evidence to the extent it suggests that Grail's current methylation-only approach to multi-cancer early detection is superior to approaches by other MCED developers that combine methylation with other approaches, such as proteomics. Grail's decision that methylation was a stronger "approach," on its own, compared to other "approaches" on their own does not imply that methylation is superior to a combination of methylation and other approaches. Indeed, the proposed finding is against the weight of evidence because [redacted]

This Court ordered experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here,

Respondents not only cite, but directly quote Dr. Cote to support supposedly factual propositions about what "Grail concluded" in contravention of this Court's Order. Dr. Cote has no personal knowledge of what "Grail concluded." This Court should disregard this evidence and the proposed finding.

383. Also, GRAIL found that methylation patterns are highly effective at identifying the origin of the cancer signals. (Ofman (GRAIL) Tr. 3291–92; RX3550 (Oxnard et al., 2019) at 1; RX3429 (Liu et al., 2019) at 2; RX3869 (Cote Expert Report) ¶ 142.)

Response to Finding No. 383

The proposed finding, which consists of language copied and pasted verbatim from Dr. Cote's report, is vague, unreliable, mischaracterizes the evidence, and relies on improper expert opinion. The proposed finding is vague because the term "highly effective," "the origin," and "the cancer signals" are undefined and provided without context. The proposed finding mischaracterizes the testimony of Dr. Ofman. Nowhere in the cited portion of the trial transcript does Dr. Ofman state that methylation patterns are "highly effective" at identifying the origin or cancer signals. Indeed, Dr. Ofman says nothing at all about cancer signal origin on the pages cited. RX3550 is a half-page abstract and not a complete article by Oxnard et al. As such, it is unreliable. The source does not state that methylation patterns are "highly effective" at identifying the origin of cancer signals, but rather comments on the "accuracy" of "TOO localization" in a particular early study. The proposed finding mischaracterizes RX3429. RX3429 states that "[i]ncorporating data from a large methylation database improved TOO performance in multiple cancer types," but does not state that methylation patterns are "highly effective" at identify the origin of cancer signals.

This Court ordered experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents not only cite, but directly paste in Dr. Cote's report language to support supposedly

factual propositions about what "Grail found" in contravention of this Court's Order. Dr. Cote has no personal knowledge of what "Grail found." This Court should disregard this evidence and the proposed finding.

384. GRAIL selected a targeted methylation-based assay (Galleri v1) for further development in CCGA2. (Ofman (GRAIL) Tr. 3291–92; RX3869 (Cote Expert Report) ¶ 142.)

Response to Finding No. 384

Complaint Counsel does not disagree with the proposed finding.

385. In total, CCGA1 took two years (though GRAIL had already commenced research and biomarker discovery before commencing CCGA1). (Ofman (GRAIL) Tr. 3294; RX3869 (Cote Expert Report) ¶ 142.)

Response to Finding No. 385

The proposed finding, which consists of language copied and pasted verbatim from Dr. Cote's report, mischaracterizes the testimony of Dr. Ofman and relies on improper expert opinion. The proposed finding mischaracterizes the testimony of Dr. Ofman. Nowhere on page 3294 of the trial transcript does Dr. Ofman state that CCGA1 "took two years," nor does he mention anything about Grail having "commenced research and biomarker development discovery before commencing CCGA1."

The only other source cited for the proposed finding is the actual source from which the proposed finding was copied and pasted verbatim – namely, the report of Dr. Cote. This Court ordered experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents not only cite, but directly paste in Dr. Cote's report language to support supposedly factual propositions about the timeline of Grail's research in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

(ii) CCGA2

386. The second CCGA sub-study, CCGA2, was designed to perform analysis, training, and validation of the Galleri v1 test, using the Galleri v1 assay developed using the findings from CCGA1. (Ofman (GRAIL) Tr. 3291–92; RX3430 (Liu et al., 2020) at 3; RX3869 (Cote Expert Report) ¶ 143.)

Response to Finding No. 386

Complaint Counsel does not disagree with the proposed finding.

387. CCGA2 included 6,689 participants, which were divided into a training set of 4,720 participants and an independent validation set of 1,969 participants, of which 4,316 participants (training: 3052; validation: 1264) were ultimately included in the final analysis population. (RX3430 (Liu et al., 2020) at 6–7; RX3869 (Cote Expert Report) ¶ 143.)

Response to Finding No. 387

The proposed finding, which consists of language copied and pasted verbatim from Dr. Cote's report, is incorrect, misleading, and mischaracterizes RX3430 (Lie et al, 2020) to the extent it suggests that the 4,316 participants included the final analysis population were from CCGA-2 enrollment. In fact, only 3,087 samples from CCGA enrollment made their way into the final training and analysis in CCGA-2; these samples were supplemented by 1,229 samples from the separate STRIVE study. (*See* RX3430 at 005, Figure 3 (Liu et al., 2020) (disclosing that of the 3052 samples in the final analysis "training" population, 892 were taken from STRIVE, and of the 1264 validation sample in the final analysis "validation" population, 337 were taken from STRIVE (4316 – 892 – 337 = 3,087)). As Nephron Healthcare Investment Research explained, "A Significant Number of CCGA Samples Were Excluded from Analysis" in the CCGA-2 sub-study and "the magnitude" of the excluded samples was "surprising." (PX4178 (Grail) at 021 ("Nephron Healthcare Investment Research, Illumina – Downgrade to Sell: In the Search for the Holy GRAIL, We Think ILMN Chose Poorly," Nov. 9, 2020) (further explaining that"CCGA-2 started with 4,841 samples – of which 3,087 made their way into the final training and analysis" and that "[i]nterestingly, to increase the overall sample size, GRAIL included 2,202 samples from the STRIVE study [and] [o]f these, 1,220 samples made their way

into the final analysis and validation.")). Therefore, this Court should disregard the proposed finding.

388. The results of the CCGA2 study, published in Annals of Oncology in March 2020, showed that Galleri was capable of detecting more than 50 cancer types at a specificity of 99.3% and a false-positive rate of less than 1% across the more than 50 cancer types. (RX3430 (Liu et al., 2020) at 1, 10.)

Response to Finding No. 388

The proposed finding, which consists of language copied and pasted verbatim from Dr. Cote's report, is vague, incomplete, and misleading. The proposed finding is vague because the terms "Galleri," "capable of detecting," and "false-positive rate" are undefined and provided without context. The proposed finding is incomplete and misleading to the extent it suggests that CCGA-2 provides evidence of how Galleri would perform when used as intended (*i.e.* use as a screening test in an asymptomatic population). There is no clinical evidence that Galleri can provide early detection of 50+ cancers in an asymptomatic population. Nor is there clinical evidence that Galleri can provide early detection of 20 cancers in an asymptomatic population, or ten, or even eight. As of trial, Galleri had been clinically shown to detect only seven types of early-stage cancer in an asymptomatic screening population – a fact conceded by Respondents' own expert. ((Cote Tr. 4000-4001) ("Q. So as of today, Galleri has been clinically shown to detect seven types of stage one through three cancer in an asymptomatic screening population, correct? A. That's correct."); [redacted].

[redacted] Respondents' own expert conceded that Stage IV cancer "is almost always incurable and will eventually result in the death of the patient." (RX3869 (Cote Rebuttal Report) ¶ 31). Likewise, the fact that Galleri can detect signals for certain cancers among individuals who have already been diagnosed with cancer does not support Galleri's ability to detect those cancers in an asymptomatic screening population.

[redacted] Indeed, 24 percent of participants in the cancer arm of the CCGA2 study were Stage IV cancer patients (RX3430 at 6). Grail's Chief Medical Officer, Dr. Ofman, conceded at trial that the CCGA study did not involve the intended use population for Galleri. (Ofman (Grail) Tr. 3294-95). The authors of the cited CCGA-2 substudy – which Respondents rely upon for their 50-cancer claim – make this point explicitly in their article, cautioning that: "to understand [Galleri's] performance in an asymptomatic screening population will require additional studies" beyond CCGA. (RX3430 at 10 (M.C. Liu, et al., Sensitive and Specific Multi-Cancer Detection and Localization Using Methylation Signatures in Cell-Free DNA, 6 Annals of Oncology 745 (2020)).

For similar reasons, Grail cannot say today what the performance of its MCED test will be in Galleri's intended use population (i.e. in an asymptomatic screening population). Grail admits as much itself. [redacted]

[redacted]

The proposed finding is also misleading in its use of the term "false positive rate" to the extent it suggests that 99 percent of cancer predictions were accurate in the CCGA-2 substudy. (*See* PX4178 (Grail) at 023 ("Nephron Healthcare Investment Research, Illumina – Downgrade to Sell: In the Search for the Holy GRAIL, We Think ILMN Chose Poorly," Nov. 9, 2020) (noting that the CCGA-2 authors used "false positive" to mean "the proportion of false-positive results among persons thought to be cancer-free (0.7%), whereas the data actually shows that the fraction of positive tests shown to be falsely positive is 49%" and, further, that the CCGA-2 authors' "chosen incidence of cancer influenced the false positive rate, which would be higher than 49%.")). [redacted] Therefore, this Court should disregard the proposed finding.

389. Galleri v1 achieved a sensitivity of 43.9% for all cancer types. (RX3430 (Liu et al., 2020) at 1,10; RX0744 (GRAIL) at 70; RX3869 (Cote Expert Report) ¶ 143.) Galleri v1 demonstrated a cancer signal of origin prediction accuracy of 93%. (RX3430 (Liu et al., 2020) at 1, 9; RX0744 (GRAIL) at 68; RX3869 (Cote Expert Report) ¶ 143.)

Response to Finding No. 389

The proposed finding is vague, incomplete, and misleading. The proposed finding is vague because the terms "achieved," "for all cancer types" and "cancer signal of origin prediction accuracy" are undefined and provided without context. The proposed finding is incomplete and misleading to the extent it suggests that CCGA-2 provides evidence of how

Galleri would perform when used as intended (*i.e.* use as a screening test in an asymptomatic population). Grail cannot say today what the sensitivity of its MCED test will be in Galleri's intended use population (i.e. in an asymptomatic screening population) or how accurate Galleri's predictions will be at localizing cancer in the intended use population.

[redacted] Indeed, 24 percent of participants in the cancer arm of the CCGA2 study were Stage IV cancer patients (RX3430 at 6). Grail's Chief Medical Officer, Dr. Ofman, conceded at trial that the CCGA study did not involve the intended use population for Galleri. (Ofman (Grail) Tr. 3294-95). [redacted] Grail admits as much itself. [redacted]

[redacted]

Respondents' own expert conceded that Stage IV cancer "is almost always incurable and will eventually result in the death of the patient." (RX3869 (Cote Rebuttal Report) ¶ 31.

[redacted]

Additionally, the proposed finding is incomplete because it omits to mention that

Galleri's reported tissue of origin accuracy was worse for Stage I-II cancers than for Stage III-IV cancers in CCGA (*See* RX3430 at 6, Figure 4 (M.C. Liu, et al., Sensitive and Specific Multi-Cancer Detection and Localization Using Methylation Signatures in Cell-Free DNA, 6 Annals of Oncology 745 (2020) [CCGA-2]). This fact further suggests that Galleri's CSO performance will be worse in an asymptomatic screening population that does not include previously diagnosed Stage III and Stage IV cancer patients, as the CCGA study did. Also, the denominator for Galleri's tissue of origin accuracy in CCGA-2 is artificially limited to just those cases in which the original cancer prediction was correct (excluding false positives) and, of those, just those cases in which Galleri actually made a tissue of origin prediction. (*See* RX3430 at 009). Therefore, this Court should disregard the proposed finding.

390. CCGA2 took another two years. (Ofman (GRAIL) Tr. 3294; RX3869 (Cote Expert Report) ¶ 143.)

Response to Finding No. 390

The proposed finding, which consists of language copied and pasted verbatim from Dr. Cote's report, is vague, mischaracterizes the testimony of Dr. Ofman, relies on improper expert opinion, and is therefore unsupported. The proposed finding is vague because the terms "took" and "another" are vague and provided without context. The proposed finding mischaracterizes the testimony of Dr. Ofman. Nowhere on page 3294 of the trial transcript does Dr. Ofman state that CCGA2 "took another two years."

The only other source cited for the proposed finding is the actual source from which the proposed finding was copied and pasted verbatim – namely, the expert report of Dr. Cote. This Court ordered, however, that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote to support factual propositions in contravention of this Court's

Order. The Court should disregard this evidence and the proposed finding.

(iii) CCGA3

391. CCGA3, the third CCGA sub-study, was designed to evaluate Galleri's performance by testing a large cohort of samples from participants with and without cancer and to validate Galleri v2 as a multi-cancer early detection test capable of population-wide testing. (Ofman (GRAIL) Tr. 3292; RX0744 (GRAIL) at 47–48; PX7069 Bishop (GRAIL), IHT at 80; RX3869 (Cote Expert Report) ¶ 144.)

Response to Finding No. 391

The proposed finding, which consists of language copied and pasted verbatim from Dr. Cote's report, is vague, mischaracterizes the evidence cited, relies on improper export opinion, and is incomplete. The proposed finding is vague because the terms "large," "with and without," "validate," "capable of," and "population-wide" are undefined and provided without context.

The proposed finding mischaracterizes the testimony of Dr. Ofman. Dr. Ofman did not testify that CCCA-3 was designed "to evaluate Galleri's performance," that CCGA-3 involved "a large cohort of samples," or that CCGA-3 was designed to validate Galleri "as a multi-cancer early detection test capable of population-wide testing" in the trial testimony cited. The proposed finding also mischaracterizes RX0744; the cited slides do not state that CCGA-3 was designed "to evaluate Galleri's performance," that CCGA-3 involved "a large cohort of samples," or that CCGA-3 was designed to validate Galleri "as a multi-cancer early detection test capable of population-wide testing." Indeed, the cited slides on RX0744 are not even about CCGA-3 specifically. The proposed finding also mischaracterizes the testimony of Mr. Bishop. Mr. Bishop did not testify that the CCGA-3 involved "a large cohort of samples," or that CCGA-3 was designed to validate Galleri "as a multi-cancer early detection test capable of population-wide testing."

The only other source cited for the proposed finding is the actual source from which the proposed finding was copied and pasted verbatim – namely, the expert report of Dr. Cote. This

Court ordered, however, that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote to support factual propositions in contravention of this Court's Order. Dr. Cote has no personal knowledge of what CCGA "was designed" to accomplish. The Court should disregard this evidence.

[redacted].

Complaint Counsel does not disagree that CCGA-3 was the third CCGA sub-study or that CCGA-3 was split into cancer and non-cancer arms. However, this Court should disregard the remainder of this proposed finding for the reasons stated above.

392. CCGA3 ultimately reported that GRAIL's Galleri v2 test achieved a specificity of 99.5% across more than 50 cancer types, a false-positive rate of 0.5%, sensitivity of 51.5% for all cancers, and a signal of origin prediction accuracy of 88.7%. (RX3408 (Klein et al., 2021) at 10; RX3869 (Cote Expert Report) ¶ 144.)

Response to Finding No. 392

The proposed finding, which consists of language copied and pasted verbatim from Dr. Cote's report, is vague, misleading, and incomplete. The terms "ultimately reported," "achieved," "across," "false-positive rate," "for all cancers," and "signal of origin prediction accuracy" are vague and undefined.

The proposed finding is incomplete and misleading to the extent it suggests that CCGA-3 provides evidence of Galleri's real-world performance (*i.e.* when use as a screening test in an asymptomatic population). There is no clinical evidence that Galleri can provide early detection

of 50+ cancers in an asymptomatic population. Nor is there clinical evidence that Galleri can provide early detection of 20 cancers in an asymptomatic population, or ten, or even eight. [redacted] Likewise, Grail cannot say today what the sensitivity, specificity, false positive rate, or tissue localization accuracy of its MCED test will be in Galleri's intended use population or how accurate Galleri's predictions will be at localizing cancer in the intended use population.

[redacted] Grail's Chief Medical Officer, Dr. Ofman, conceded at trial that the CCGA study did not involve the intended use population for Galleri. (Ofman (Grail) Tr. 3294-95). The authors of the CCGA-3 sub-study make this point explicitly in their article, cautioning that "CCGA is a case-control study, and as such, is not reflective of performance in a screening population." (RX3409 at 010 (E.A. Klein, et al., Clinical Validation of a Targeted Methylation-Based Multi-Cancer Early Detection Test Using an Independent Validation Set, 9 Annals of Oncology 1167 (2021)). Grail admits as much itself. [redacted]

[redacted]

The fact that Galleri can detect signals for certain cancers among individuals who have already been diagnosed with cancer does not support Galleri's ability to detect those cancers in an asymptomatic screening population. [redacted]

Respondents' own expert conceded that Stage IV cancer "is almost always incurable and will eventually result in the death of the patient." (RX3869 (Cote Rebuttal Report) ¶ 31.

[redacted] *see also* PX4178 (Grail) at

024 ("Nephron Healthcare Investment Research, Illumina – Downgrade to Sell: In the Search for the Holy GRAIL, We Think ILMN Chose Poorly," Nov. 9, 2020) (explaining that, in practice, the sensitivity for late stage cancers is irrelevant as they are likely detectable by symptoms)).

The suggestion that the reported 51.5% sensitivity number in CCGA-3 applies to "all cancers" is also misleading – even in the non-representative, non-screening setting in which Galleri was assessed. The sensitivity of Galleri varied by cancer type and cancer stage. Specifically, Galleri's overall sensitivity for Stage I cancers was just 16.8 percent in CCGA-3, and Galleri's overall sensitivity for Stage II cancers was just 40.4 percent. (RX3409 at 009).

[redacted]

Additionally, the cancer signal or origin ("CSO") accuracy numbers reported in CCGA-3 overstate the extent to which Galleri was able to correctly identify the location of cancer – even in the non-representative, non-screening setting in which Galleri was assessed. Specifically, the denominator for Galleri's reported CSO accuracy in CCGA-3 (which produced the 88.7% statistic) was artificially limited to just those cases in which the original cancer prediction was correct (excluding false positives). But a CSO prediction cannot be said to be "correct" or "accurate" in instances where a patient has no cancer at all.

Additionally, Grail counts Galleri's CSO predictions as being correct even in instances when Galleri does not actually identify the location of the underlying cancer. One of Galleri's cancer signal of origin categories is "Neuroendocrine Cells of Lung or Other Organs" (RX3409 at 10 (E.A. Klein, et al., Clinical Validation of a Targeted Methylation-Based Multi-Cancer Early Detection Test Using an Independent Validation Set, 9 Annals of Oncology 1167 (2021)

[CCGA-3]). The supplementary materials to the CCGA-3 study disclose that the "neuroendocrine" CSO label actually includes instances of cancer from twelve different CCGA cancer classes: pancreas, gallbladder, esophagus, stomach, bladder, urothelial tract, cervix, colon/rectum, head and neck, lung, prostate, and uterus (RX3773 at 31, Figure S1 (M.C. Liu, et al., Supplementary Information: Sensitive and Specific Multi-Cancer Detection and Localization Using Methylation Signatures in Cell-Free DNA, 2021)). These cancers are spread out across the entire human body; a "correct" CSO prediction of "neuroendocrine cells of lung or other organs" is thus not actually a specific tissue of origin prediction at all. The CCGA-3 substudy authors acknowledge this, stating that CSO predictions that fall into this catch-all category "may require a whole-body computed tomography (CT) or positron emission tomography (PET)-CT scan to localize the primary tumor." (RX3409 at 009 (E.A. Klein, et al., Clinical Validation of a Targeted Methylation-Based Multi-Cancer Early Detection Test Using an Independent Validation Set, 9 Annals of Oncology 1167 (2021)). Therefore, this Court should disregard the proposed finding.

393. Galleri v2 is the test currently being offered by GRAIL commercially as an LDT. (Ofman (GRAIL) Tr. 3317; RX3869 (Cote Expert Report) ¶ 144.)

Response to Finding No. 393

Complaint Counsel has no specific response to the proposed finding.

b. PATHFINDER

394. Starting in December 2019, GRAIL began enrolling participants for its prospective, interventional multi-center study PATHFINDER. (RX3044 (GRAIL) at 1–2 RX3869 (Cote Expert Report) ¶ 145.)

Response to Finding No. 394

Complaint Counsel has no specific response to the proposed finding.

395. PATHFINDER's primary goal is to assess the extent and types of diagnostic testing required to achieve a diagnostic resolution after a patient has received a cancer screening

test result that indicates "Signal Detected", meaning the potential presence of cancer, along with a predicted or indeterminate tissue of origin. (Ofman (GRAIL) Tr. 3295–98; RX0611 (GRAIL) at 9; RX3869 (Cote Expert Report) ¶ 145.)

Response to Finding No. 395

Complaint Counsel does not disagree with the proposed finding.

396. Another goal of PATHFINDER is to test the performance of Galleri's v1 assay and review patient experiences and satisfaction with the test. (Ofman (GRAIL) Tr. 3295–98, 3299–3300; RX0611 (GRAIL) at 9; RX3869 (Cote Expert Report) ¶ 145.)

Response to Finding No. 396

Complaint Counsel has no specific response to the proposed finding.

397. It is the first study in which Galleri results were returned to participants and their clinicians to allow them to undertake the necessary diagnostic steps necessary for a proper cancer diagnosis after receiving the results of a Galleri test. (Ofman (GRAIL) Tr. 3296–97 RX3869 (Cote Expert Report) ¶ 145.)

Response to Finding No. 397

Complaint Counsel does not disagree with the proposed finding but notes, for completeness, that PATHFINDER was the first *Grail* study to return results to participants and their clinicians. It was not the first study of an MCED test to return results to participants and their clinicians. Grail had not published the final results of PATHFINDER as of trial.

398. This study allowed GRAIL to evaluate the implementation of Galleri in clinical practice. (Ofman (GRAIL) Tr. 3296–97; RX3869 (Cote Expert Report) ¶ 145.)

Response to Finding No. 398

The proposed finding, which consists of language copied and pasted verbatim from Dr.

Cote's report, is vague and misleading. The proposed finding is vague because the terms "[t]his study," "implementation of Galleri," and "clinical practice" are undefined. The proposed finding is misleading because its use of the past tense ("allowed") suggests that the PATHFINDER study had been completed. [redacted] Therefore, this Court should disregard the proposed finding.

> 398.1 "The purpose of PATHFINDER was very clear. We needed to show -- after the clinical validation of our test, we needed to better understand how positive results were going to get worked up, how the test was actually going to get implemented in clinical practice. And we also wanted to understand whether the positive predictive value, which again is the key clinical measure, that we saw in the CCGA study, how that would translate into the real world, and so that was going to be a core aspect of PATHFINDER. PATHFINDER was not designed or powered to replicate the sensitivity of Galleri or to try to find, you know, all the cancers that Galleri can find, because that would require hundreds of thousands of people. So it was really a feasibility study about implementing Galleri into actual clinical practice." (Ofman (GRAIL) Tr. 3296–97.)

Response to Finding No. 398.1

The proposed finding is vague, misleading, and unreliable. The proposed finding is vague because the terms and phrases "clinical validation of our test," "worked up," "key clinical measure," and "that we saw," and "all the cancers that Galleri can find" are undefined. The proposed finding is unreliable as to positive predictive value being the "the key clinical measure" (whatever that means) because Respondents cite only to the self-serving testimony of a Grail executive that is uncorroborated by any ordinary course documents or analysis.

The proposed finding is also misleading because its use of the past tense ("was really a feasibility study") suggests that the PATHFINDER study had been completed. [redacted] Complaint Counsel does not dispute that, notwithstanding CCGA, Grail lacked understanding of how its test would actually be

implemented in clinical practice or how performance metrics from CCGA (which was a non-representative case-control study involving participants with previous cancer diagnoses) would "translate into the real world." Complaint Counsel also does not dispute Dr. Ofman's concession that it would potentially "require hundreds of thousands of people" to assess Galleri's ability to detect (or not detect) the cancers from the cancer arm of the CCGA study in an asymptomatic screening population.

> 398.2 The results of PATHFINDER so far have been promising:
>
> Q. And was GRAIL happy with the interim results of the PATHFINDER study?
>
> A. Yes. It was really remarkable that it performed pretty close to as we predicted it would, and the PPV that we've seen thus far on the interim seems to be very well-aligned with what we've seen in prior studies. And that's really important because in this field, you know, it's littered with companies that do these small, underpowered studies, case-control studies -- I have lots of examples -- where they put it into actual clinical care and the tests don't work. And so, you know, there's a lot of skepticism about that, and so it was really important for us to show that the robust CCGA study was able to replicate itself under real-world conditions. (Ofman (GRAIL) Tr. 3296–97.)

Response to Finding No. 398.2

The proposed finding is vague, unreliable, incomplete, and misleading. The proposed finding is vague because the terms "promising," "happy," "performed," "pretty close to as we predicted it would," "seems to be," "very well-aligned," "prior studies," "this field," "underpowered," "skepticism about that," "robust," and "replicate itself" are undefined and provided without context. The proposed finding is unreliable because Respondents cite only to the self-serving testimony of a Grail executive that is uncorroborated by any ordinary course documents or analysis.

The proposed finding is misleading because the term "promising" is an

argument/characterization by Respondents, not a factual statement made by the witness cited. The proposed finding is also misleading because Dr. Ofman's use of the past tense ("performed," "was able to replicate") suggests that the PATHFINDER study had been completed. [redacted]

The proposed finding is also misleading to the extent the citation to Dr. Ofman's testimony that Galleri "performed pretty close to as we predicted it would" in PATHFINDER suggests that Galleri's actual performance was similar to its performance in the CCGA study. [redacted] Dr. Ofman's statement that Galleri performed "pretty close" to Grail's expectations is thus vague, misleading, and proves little.

In fact, Galleri's interim "performance" in PATHFINDER for asymptomatic patients of normal (non-elevated) risk was substantially worse than Galleri's performance in CCGA. The reported interim PPV for normal-risk patients in PATHFINDER was 30. (RX3041 at 004) [redacted]

[redacted]

In addition, Galleri did not detect many early-stage cancers in PATHFINDER. According to the interim results of PATHFINDER, Galleri detected 9 total instances of Stage I-II cancer out of 6629 participants. (RX3041 at 005). Galleri also returned 36 false positive results. (RX3041 at 003). Nine participants wound up undergoing invasive procedures based on falsely positive Galleri results. (RX3041 at 003). [redacted] Thus, Galleri was four times as likely to falsely identify cancer as it was to correctly identify "early stage" cancer (as defined by Dr. Cote), and Galleri was as likely to lead to an unnecessary invasive procedure as it was to correctly identify "early stage" cancer.

Complaint Counsel does not disagree with Dr. Ofman's assessment that "small . . . case-control studies" are not sufficient to establish how clinical tests will perform under real-world conditions. [redacted] For those reasons, Dr. Ofman acknowledged at trial that it is therefore "really important" for Grail to demonstrate the Galleri test's performance "under real-world conditions." (Ofman (Grail) Tr. 3297). With the exception of the specific language noted with which Complaint Counsel does not disagree, this Court should disregard the proposed finding.

398.3 In PATHFINDER, Galleri has detected "13 different types of cancer, and some in their early stages. We found early pancreatic cancer. We found early liver cancer. We found early head and neck cancer. We found a lot of hematologic malignancies. So it was almost like you were standing on the street corner watching

healthy 50-year-olds walk by that had no idea they had cancer and seeing the cancers just light up as they walked by. It was really remarkable." (Ofman (GRAIL) Tr. 3297–98.)

Response to Finding No. 398.3

The proposed finding is vague, unreliable, incomplete, and misleading. The proposed finding is vague because the term "some cancers" is undefined and Dr. Ofman's entire extended simile about standing on a street corner lacks specificity and represents an imagined scenario rather than facts of which he has personal knowledge. The proposed finding is unreliable because Respondents cite only to the self-serving testimony of a Grail executive that is uncorroborated by any ordinary course documents or analysis.

The proposed finding is incomplete because it omits to mention the fact that only seven of the 13 types of cancer detected in PATHFINDER were Stage I-III cancers. (RX3041 at 005). At most, therefore, Galleri detected seven types early-stage cancers in PATHFINDER. (*See* RX3041 at 005; Cote Tr. 4000-4001 ("Q. So as of today, Galleri has been clinically shown to detect seven types of stage one through three cancer in an asymptomatic screening population, correct? A. That's correct."). [redacted] By his definition, Galleri detected only five types early-stage cancers in PATHFINDER. (RX3041 at 005)].

Complaint Counsel does not disagree that Galleri detected 13 different types of cancer in the PATHFINDER study, including "pancreatic cancer," "early liver cancer," "early head and neck cancer" and "hematologic malignancies." [redacted]

With the exception of the specific language noted with which Complaint Counsel does not

disagree, this Court should disregard the proposed finding.

> 398.4 There was no concern that Galleri found 13 different types of cancer rather than 50 in PATHFINDER. To find "all 50 cancers, you know, in a real-world population is going to require hundreds of thousands of people, so PATHFINDER was not designed to do that. PATHFINDER was really designed to understand the specificity of the test and its positive predictive value. So no, we were -- we were thrilled that there was such a diversity of cancers that were found in PATHFINDER." (Ofman (GRAIL) Tr. 3298.)

Response to Finding No. 398.4

The proposed finding is vague, unreliable, misleading, and against the weight of the evidence. The proposed finding is vague because the phrases "There was no concern," "Galleri found," "really designed," and "thrilled" are undefined. The proposed finding is unreliable because Respondents cite only to the self-serving testimony of a Grail executive that is uncorroborated by any ordinary course documents or analysis.

The proposed finding is incomplete because it omits to mention the fact that only seven of the 13 types of cancer detected in PATHFINDER were Stage I-III cancers. (RX3041 at 005; Cote Tr. 4000-4001 ("Q. So as of today, Galleri has been clinically shown to detect seven types of stage one through three cancer in an asymptomatic screening population, correct? A. That's correct."). [redacted] Respondents' own expert conceded that Stage IV cancer "is almost always incurable and will eventually result in the death of the patient." (RX3869 (Cote Rebuttal Report) ¶ 31).

The proposed finding is misleading and against the weight of the evidence to the extent it suggests that the primary goal of PATHFINDER was "to understand the specificity of the test

and its positive predictive value." [redacted] Therefore, this Court should disregard the proposed finding.

Complaint Counsel also does not dispute Dr. Ofman's concession that it would potentially "require hundreds of thousands of people" to assess Galleri's ability to detect (or not detect) the cancers from the cancer arm of the CCGA study in an asymptomatic screening population.

399. PATHFINDER recruited 6, 662 participants over the age of 50 and divided them into two different cohorts, a cohort with additional risk of a positive cancer result (3695; ~55% of total enrollment), and another cohort containing participants without any heightened risk (2934). (Ofman (GRAIL) Tr. 3293; RX0744 (GRAIL) at 73; RX3869 (Cote Expert Report) ¶ 146.)

Response to Finding No. 399

The proposed finding, which consists of language copied and pasted verbatim from Dr. Cote's report, mischaracterizes the evidence, relies on inappropriate expert opinion, and is unsupported and misleading. The proposed finding mischaracterizes Dr. Ofman's testimony. In the cited portion of the trial transcript, Dr. Ofman did not state that participants were over the age of 50, he did not state that participants were divided into different cohorts, and he did not attempt to describe the difference between cohorts. The proposed finding also mischaracterizes RX0744. Nowhere on the page cited does RX0744 state that participants were divided into different cohorts and, accordingly, no description of different cohorts is provided.

The only other source cited for the proposed finding is the actual source from which the proposed finding was copied and pasted verbatim – namely, the expert report of Dr. Cote. This Court ordered, however, that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3.

Here, Respondents cite Dr. Cote to support factual propositions in contravention of this Court's Order. Dr. Cote has no personal knowledge of PATHFINDER's recruitment process. The Court should disregard this evidence. Other than the fact that PATHFINDER involved 6,662 over the age of 50, the rest of the proposed finding is unsupported by any valid evidence in the record.

The proposed finding is also misleading and incorrect to the extent it suggests that participants were first recruited into PATHFINDER and subsequently divided into different risk cohorts. In fact, Grail specifically targeted elevated risk participants for the study "to enrich the study population for the number of cancer diagnoses." (*See* RX0611 (Grail) at 31 (PATHFINDER Clinical Study Protocol). Therefore, this Court should disregard the proposed finding.

399.1 Heightened cancer risk was based on a history of smoking, genetic cancer predisposition, or a personal history of malignancy more than 5 years previously. (RX0611 (GRAIL) at 30–31.) [redacted]

Response to Finding No. 399.1

[redacted]

[redacted]

400. In February 2021, GRAIL released interim PATHFINDER results that were positive and largely confirmed the previous studies. (Ofman (GRAIL) Tr. 3293; [redacted]

Response to Finding No. 400

[redacted]

[redacted]

[redacted]

[redacted]

401. [redacted]

Response to Finding No. 401

[redacted]

[redacted]

402. At the time of trial, GRAIL expected to complete the PATHFINDER study in January 2022. (RX3044 (GRAIL) at 2; RX3869 (Cote Expert Report) ¶ 147.)

Response to Finding No. 402

Complaint Counsel does not disagree with the proposed finding.

c. STRIVE

403. STRIVE is a prospective, observational, longitudinal, cohort study of approximately 100,000 women undergoing mammography for screening indications and associated medical care, whose samples were taken around the time of a screening mammogram

appointment. (Cote Tr. 3804; Ofman (GRAIL) Tr. 3293–95; RX0744 (GRAIL) at 71; RX3869 (Cote Expert Report) ¶ 148.)

Response to Finding No. 403

The proposed finding is vague and incomplete. The proposed finding is vague because the terms "approximately," "for screening indications," "associated medical care," and "around the time" are undefined. The actual number of participants enrolled in STRIVE based on data from ClinicalTrials.gov is less than 99,481. (*See* PX0390 ClinicalTrials.gov Search Results for "Grail," Sept. 23, 2021). Therefore, this Court should disregard the proposed finding.

404. The goals of the STRIVE study are to confirm the performance of Galleri in a population with no known active cancer diagnosis, validate Galleri's ability to detect breast cancer and to evaluate Galleri's test performance and sensitivity in the clinically meaningful subgroup of breast cancer patients. (Ofman (GRAIL) Tr. 3293–95; Cote Tr. 3804–05; RX0744 (GRAIL) at 71; RX3869 (Cote Expert Report) ¶ 148.)

Response to Finding No. 404

The proposed finding, which consists of language copied and pasted verbatim from Dr. Cote's report, is vague and confusing. The proposed finding is vague because the terms "[t]he goals," "confirm," "performance," "validate," "ability to detect," "test performance and sensitivity," "clinically meaningful subgroup," and "breast cancer patients" are undefined. The proposed finding is confusing because it references both a "population with no known active cancer diagnosis" and breast cancer "patients." It is unclear how an individual can both have no active cancer diagnosis and yet simultaneously be a cancer "patient," and so it is unclear whether Respondents (Dr. Cote) are referencing one or two different groups.

The proposed finding is misleading to the extent that the references to "confirm[ing]" Galleri's performance and "validat[ing]" Galleri's ability suggest that Grail has already demonstrated a clinically meaningfully ability to detect early-stage instances of breast cancer. Complaint Counsel notes, for completeness, that Galleri detected only 7 out of 265 instances of

Stage I breast cancer in the CCGA-3 substudy (2.6%), and 93 out of 446 instances of breast cancer across Stages I-II (20.9%). Therefore, this Court should disregard the proposed finding.

405. The STRIVE study took its first sample in February 2017 and finished enrollment in November 2018. (RX0744 (GRAIL) at slide 71; RX3869 (Cote Expert Report) ¶ 148.)

Response to Finding No. 405

Complaint Counsel has no specific response to this proposed finding.

406. The STRIVE study is actively following up on the participants from their first blood draw until the first documented invasive cancer diagnosis (assessed up to 30 months), collecting data on cancer diagnosis and treatment. (RX3134 (GRAIL) at 1–2; RX0744 (GRAIL) at 71; RX3869 (Cote Expert Report) ¶ 148.)

Response to Finding No. 406

The proposed finding, which consists of language copied and pasted verbatim from Dr. Cote's report, is vague, mischaracterizes the evidence, and relies on improper expert opinion. The proposed finding is thus also unsupported by valid record evidence. The proposed finding is vague because no timeline or reference is provided for the phrase "is actively." The proposed finding mischaracterizes RX3134. Nowhere on the cited pages does the source say that Grail (or "the STRIVE study") is "actively following up on the participants;" there is no mention of anything being "assessed up to 30 months," nor is there any mention of data collection related to "treatment" received by participants who receive a cancer diagnosis. The proposed finding also mischaracterizes RX0744. RX0744 summarizes "study objectives" and the "study design" of STRIVE, but does not comment in any way on the status of the study or suggest that Grail (or "the STRIVE study") is "actively following up on the participants."

The only other source cited for the proposed finding is the actual source from which the proposed finding was copied and pasted verbatim – namely, the expert report of Dr. Cote. This Court ordered, however, that experts shall not be cited to "support factual propositions that

should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote to support factual propositions in contravention of this Court's Order. Dr. Cote has no personal knowledge of the status of the STRIVE study. The Court should disregard this evidence and the proposed finding.

d. SUMMIT

407. SUMMIT is a prospective, observational, cohort study. (RX3291 (GRAIL) at 1; RX0744 (GRAIL) at 46–47, 72; RX3869 (Cote Expert Report) ¶ 149.)

Response to Finding No. 407

Complaint Counsel does not disagree with the proposed finding.

408. The primary objective of SUMMIT is to evaluate Galleri's performance in a smoking population, meaning those with a high risk of lung cancer, with no known active cancer diagnosis. (RX3135 (GRAIL) at 1–2; RX0744 (GRAIL) at slide 72; RX3869 (Cote Expert Report) ¶ 149.)

Response to Finding No. 408

Complaint Counsel does not disagree that one of the primary objectives of SUMMIT is to assess Galleri's performance in a smoking population. The proposed finding is incomplete and misleading, however, in that Grail lists two "primary" objectives for SUMMIT, including "to examine the performance and patient experience with [low-dose CT]." RX0744 (GRAIL) at slide 72. *See* RX3135 (GRAIL) at 1 for definition of LDCT.

409. SUMMIT enrolled approximately 13,000 participants between the ages of 50–77 with a substantial smoking history exclusively from the United Kingdom. (RX3291 (GRAIL) at 1; RX3135 (Clinicaltrials.gov) at 1–2; RX3869 (Cote Expert Report) ¶ 149.)

Response to Finding No. 409

Complaint Counsel has no specific response to the proposed finding.

410. SUMMIT enrolled its first patient in April of 2019 and completed enrollment in May 2021. (RX3135 (GRAIL) at 2; RX3291 (GRAIL) at 1; RX0744 (GRAIL) at 72; RX3869 (Cote Expert Report) ¶ 149.)

Response to Finding No. 410

The proposed finding, which consists of language copied and pasted verbatim from Dr. Cote's report, mischaracterizes the cited evidence, relies on improper expert opinion, and is therefore unsupported. Neither RX3135 at 2, RX3291 at 1, nor RX0744 at 72 state any information about completion of enrollment for SUMMIT.

The only other source cited for the proposed finding is the actual source from which the proposed finding was copied and pasted verbatim – namely, the expert report of Dr. Cote. This Court ordered, however, that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote to support factual propositions in contravention of this Court's Order. Dr. Cote has no personal knowledge of the status of the STRIVE study. The Court should disregard this evidence and the proposed finding.

411. Participants in SUMMIT will provide annual blood draws for three years, rather than a one-time blood draw. (RX3291 (GRAIL) at 1; RX0744 (GRAIL) at 72; RX3869 (Cote Expert Report) ¶ 149.)

Response to Finding No. 411

Complaint Counsel has no specific response to the proposed finding.

412. The study intends to follow up with each participant through medical records and the National Cancer Registry for a period of 10 years. (RX0744 (GRAIL) at 72; RX3869 (Cote Expert Report) ¶ 149).

Response to Finding No. 412

Complaint Counsel has no specific response to the proposed finding.

B. Other Test Developers Alleged by Complaint Counsel To Be in the Cancer Screening Space

413. Other companies, including Exact Sciences Corp. ('Exact'), Thrive Earlier Detection Corp. ('Thrive'), Guardant, Inc. ('Guardant'), Singlera Genomics, Inc. ('Singlera'), Freenome, Inc. ('Freenome'), Helio Health, Inc. ('Helio'), Natera, Inc. ('Natera'), and Foundation Medicine ('FMI'), are or purport to be developing cancer screening tests. These companies are all far behind GRAIL in the development of a multi-cancer screening test.

Response to Finding No. 413

The proposed finding is unsupported and vague because no evidence is cited. This Court should disregard the proposed finding. The proposed finding is also vague because the term "far behind" is undefined. Therefore, this Court should disregard the proposed finding.

1. Exact Sciences / Thrive Earlier Detection

414. Exact Sciences Corp. ("Exact") is a molecular diagnostics company based in Madison, Wisconsin. (RX3197 (Exact/Thrive) at 1, 4.) Thrive Earlier Detection Corp. ("Thrive"), now a part of Exact, is a molecular diagnostics company based in Cambridge, Massachusetts and Baltimore, Maryland. (RX2650 (Morgan Stanley) at 4.)

Response to Finding No. 414

Complaint Counsel does not disagree with the proposed finding.

415. Thrive was founded in 2019 by licensing technologies developed at the Johns Hopkins University by founding professors Bert Vogelstein, Kenneth W. Kinzler, and Nickolas Papadopoulos. (RX3398 (Johns Hopkins Technical Ventures) at 2; RX3869 (Cote Expert Report) ¶ 173.)

Response to Finding No. 415

Complaint Counsel does not disagree with the proposed finding.

416. While Thrive was founded in 2019, it builds on research from the Vogelstein group and from Vogelstein's efforts in his prior company, PapGene, which was founded in 2014. (PX7101 (Vogelstein (Johns Hopkins University) Dep. at 26–29); RX3869 (Cote Expert Report) at ¶ 173.)

Response to Finding No. 416

The proposed finding is vague because it does not define the terms "builds on research" or "efforts in his prior company." Additionally, the proposed finding is unsupported by the cited exhibits. To the extent the proposed finding is based on Dr. Cote's Expert Report, Dr. Cote is not a credible witness, so his opinion does not deserve any weight. [redacted]

[redacted]

[redacted] Therefore, this Court should disregard the proposed finding.

417. Exact/Thrive is currently developing a cancer screening test known as "CancerSEEK". (Lengauer (Exact/Thrive) Tr. 158.)

Response to Finding No. 417

Complaint Counsel does not disagree with the proposed finding.

418. Complaint Counsel has presented no evidence that the current version of CancerSEEK in development is capable of competing with the Galleri test unless significant changes are made to the assay. (Cote Tr. 3814–15, 3823; RX3869 (Cote Expert Report) ¶ 174.)

Response to Finding No. 418

This Court ordered that experts shall not be cited to "support factual proposition that should be established by fact witnesses or documents." Here, Respondents cite Dr. Cote as the only source of evidence supporting the proposed fact in contravention of this Court's Order. This Court should disregard this evidence.

[redacted]

[redacted]

[redacted] This Court should not accord Dr. Cote's opinion[s] any weight. Therefore, this Court should disregard the proposed finding.

419. Specifically, the CancerSEEK assay is only designed to detect 10 cancer types, not the over 50 types of cancers by Galleri. (RX3869 (Cote Expert Report) ¶ 174.) Also, the CancerSEEK assay does not identify the cancer signal of origin, which is why it is combined with a whole-body PET-CT. (RX3869 (Cote Expert Report) ¶ 174.)

Response to Finding No. 419

The proposed finding, which consists of language copied and pasted verbatim from Dr. Cote's report, is improper, unreliable, misleading, and against the weight of evidence. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report as support for both sentences, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 174; *see* Order on Post-Trial Findings at 3). Respondents improperly rely on Dr. Cote's expert opinions to support this portion of the proposed finding, in contravention of this Court's Order, and therefore this Court should disregard the Respondents' proposed finding.

The proposed finding is also misleading and against the weight of evidence to the extent that it suggests there is evidence that Galleri can provide early detection of more cancers than CancerSEEK in a screening population. Just the opposite is in fact the case. There is no clinical evidence that Galleri can provide early detection of 50+ cancers in an asymptomatic population.

[redacted]

[redacted]

Respondents' reference to "over 50 cancer types" is misleading because it seeks to conflate the detection of cancer signals among previously diagnosed cancer patients (including many with Stage IV cancer) with the clinically relevant issue of an MCED test's capability to identify early-stage cancers in an asymptomatic screening population. [redacted] Respondents' own expert conceded that Stage IV cancer "is almost always incurable and will eventually result in the death of the patient." (RX3869 (Cote Rebuttal Report) ¶ 31). Likewise, the fact that Galleri can detect signals for certain cancers among individuals who have already been diagnosed with cancer does not support Galleri's ability to detect those cancers in an asymptomatic screening population.

[redacted]

420. [redacted]

Response to Finding No. 420

[redacted]

[redacted]

[redacted]

[redacted]

421. [redacted]

Response to Finding No. 421

[redacted]

[redacted]

[redacted]

a. Exact/Thrive's CancerSEEK Test

422. CancerSEEK is a multiomics test. (RX3869 (Cote Expert Report) ¶ 174.) The reported version of CancerSEEK requires several steps. (RX3419 (Lennon et al., 2020); Lengauer (Exact/Thrive) Tr. 246–48, 260.)

[redacted]

Response to Finding No. 422

The proposed finding, which consists of language copied and pasted verbatim from Dr. Cote's report, is improper, unreliable, misleading, and vague. The proposed finding violates this Court's Post-Trial Order in three different ways: (1) it improperly cites expert opinion to support

a factual proposition, (2) it fails to provide any specific page reference to a cited source, and (3) it improperly includes (and cites by reference) a demonstrative not in evidence.

Respondents cite only to Dr. Cote's report to support the first sentence of the proposed finding. This is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Respondents' proposed citation thus contravenes this Court's Order. This Court should disregard this evidence.

Second, Respondents' fail to provide the page number for their proffered citation to RX3419. This Court ordered that "[w]hen citing to exhibits, the parties shall identify the document by the PX or RX number, followed by the name of the entity that produced the document, and the page number." (Order on Post-Trial Findings at 3). RX3419 is a 43-page document; Respondents fail to cite any specific page or page range in the document in contravention of the Court's Order. The Court should also disregard this proposed evidence.

Third, Respondents include an improper demonstrative in their proposed finding. This Court ordered that no Party shall cite to evidence that was determined at trial to be "disregarded" or "not considered" or otherwise not in evidence. *See* Order on Post-Trial Findings at 3. This Court should disregard this evidence. *See* Chicago Bridge & Iron Co., Dkt 9300. *See* 2003 FTC LEXIS 98 (June 12, 2003) (striking unadmitted exhibits cited in findings of fact). Here Respondents reproduce RDX0014-57 in contravention of this Court's Order. The material in RDX0014-57 is uncited, meaning the only citation provided by Respondents is the RDX number itself. The inclusion of this improper demonstrative is itself misleading because Respondents' use of the Thrive logo at the top of the document suggests that it is an actual Thrive document, when in fact it is a non-evidentiary demonstrative exhibit created by Respondents. The Court

should disregard this proposed evidence and thus the proposed finding.

423. The first iteration of the CancerSEEK blood test analyzed two types of biomarkers: 16 gene mutations and nine protein biomarkers (including 61 variant regions of interest within the genes, called "amplicons"). (Lengauer (Exact/Thrive) Tr. 210–11; RX3419 (Lennon et al., 2020) at 3.)

Response to Finding No. 423

Complaint Counsel does not disagree with the proposed finding.

424. In the DETECT-A clinical trial, two blood tests were performed in the Thrive workflow. (Lengauer (Exact/Thrive) Tr. 247; RX3419 (Lennon et al., 2020) at 3.)

Response to Finding No. 424

Complaint Counsel does not disagree with the proposed finding.

424.1 Initially, a baseline CancerSEEK test was performed and then an additional confirmatory blood test was performed on the individuals who tested positive for cancer to assess only the particular DNA or protein markers that were abnormal in the baseline, as well as to rule out the presence of clonal hematopiesis (CHiP), which is a blood mutation that might cause false positives in those DNA or protein markers. (Lengauer (Exact/Thrive) Tr. 247; [redacted]; RX3419 (Lennon et al., 2020) at 3).)

Response to Finding No. 424.1

Complaint Counsel does not disagree with the proposed finding.

425. Individuals remaining positive after the two blood tests were then scanned using full-body PET-CT imaging. (Lengauer (Exact/Thrive) Tr. 248; Cote Tr. 3811–12; [redacted] RX3419 (Lennon et al., 2020) at 3.)

Response to Finding No. 425

Complaint Counsel has no specific response to the proposed finding.

425.1 The CancerSEEK assay as it exists today is not a liquid biopsy-only test, and does not solely rely on NGS. (RX3869 (Cote Expert Report) ¶ 175.)

Response to Finding No. 425.1

The proposed finding, which consists of language copied and pasted verbatim from Dr. Cote's report, is improper, unreliable, vague, misleading, and against the weight of evidence.

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report and testimony in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 175; *see* Order on Post-Trial Findings at 3). This Court should disregard the Respondents' proposed finding.

The proposed finding is vague because the terms "CancerSEEK assay," "as it exists today" and "liquid biopsy-only test" are undefined. Respondents cite no documentary or testimonial evidence for the proposition that the CancerSEEK *assay* itself is "not a liquid biopsy-only test," whatever that term means.

The proposed finding is also misleading to the extent it suggests that Galleri is a "liquid biopsy-only test" in a way that CancerSEEK is not. [redacted] Grail's CEO, Hans Bishop, testified at trial that certain patients may have to undergo a body scan following a positive Galleri test to identify the cancer tissue of origin. (Bishop (Grail) Tr. 1387). The authors of Grail's CCGA-3 substudy also acknowledge that individuals who receive a positive Galleri result "may require a whole-body computed tomography (CT) or positron emission tomography (PET)-CT scan to localize the primary tumor." (RX3409 at 009 (E.A. Klein, et al., Clinical Validation of a Targeted Methylation-Based Multi-Cancer Early Detection Test Using an Independent Validation Set, 9 Annals of Oncology 1167 (2021)). [redacted]

[redacted] If Grail had already established the extent to which PET-CT and other types of diagnostic testing would be required to achieve diagnostic resolution when Galleri is used in a real-world setting, such a study would not be necessary. Interim results from PATHFINDER indicate that additional imaging testing was overwhelmingly required to achieve diagnostic resolution for patients who received positive Galleri results. According to the preliminary results of PATHFINDER, "[m]ost participants with diagnostic resolution had at least 1 imaging test (57/63; 90%)." RX3041 at 001 (Tomasz M. Beer, Interim Results of PATHFINDER, a Clinical Use Study Using a Methylation-Based Multi-Cancer Early Detection Test, 2021 ASCO Annual Meeting Presentation, June 4, 2021) (the presentation fails to disclose the share of imaging tests that were PET-CT tests). Over half of positive results in PATHFINDER were false positives; 25 percent of participants who received falsely positive Galleri results wound up undergoing at least one invasive procedure. RX3041 at 003 (Tomasz M. Beer, Interim Results of PATHFINDER, a Clinical Use Study Using a Methylation-Based Multi-Cancer Early Detection Test, 2021 ASCO Annual Meeting Presentation, June 4, 2021)). Therefore, this Court should disregard the

proposed finding.

426. [redacted]

Response to Finding No. 426

[redacted]

[redacted]

426.1 In the earlier case-control study conducted by Thrive's founders, CancerSEEK was able to localize the cancer signal of origin to two anatomic sites in a median of 83% of patients. (RX3142 (Cohen 2018) at 3.)

Response to Finding No. 426.1

[redacted]

426.2 However, this method was not used in the DETECT-A study, where Thrive opted for a full-body PET-CT instead. (Lengauer (Exact/Thrive) Tr. 248; RX3869 (Cote Expert Report) at n. 240.)

Response to Finding No. 426.2

The proposed finding is vague and confusing because the term "this method" is undefined. Therefore, this Court should disregard the proposed finding.

426.3 Of the 53 patients identified by PET-CT as having "imaging concerning for cancer," only 15 was determined to have cancer, with only a 28.3% detection rate. (RX3419 (Lennon et al., 2020) at 4, Fig. 2; Lengauer (Exact/Thrive) Tr. 255–56.)

Response to Finding No. 426.3

The proposed finding, which consists of language copied and pasted nearly verbatim from footnote 240 of Dr. Cote's report, is vague, unsupported, misleading, and unreliable. The proposed finding is vague because the term "identified by PET-CT" is vague and no context is given for how PET-CT was specifically used in the study design. The term "detection rate" is also vague, undefined, and appears nowhere in the material source. The proposed finding is unsupported because page 4 of RX3419 fails to support any of the statements in the proposed finding. To the extent Respondents intended to cite to Figure 2 on page 5 of RX3419, that figure also does not state that 15 of 53 patients identified by PET-CT as having imaging concern for cancer were determined to have cancer, or make any reference to a "28.3% detection rate."

The proposed finding is also misleading because—like numerous of Respondents' other proposed findings—it is copied and pasted nearly verbatim from Dr. Cote's report (RX3869 (Cote Report) ¶ 175 n.240), even though Respondents do not attribute it to Dr. Cote. Respondents copy-and-paste was only *nearly* verbatim. Respondents changed two of the numbers from n.240 of Dr. Cote's report. Dr. Cote refers to "the 54 patients identified by PET-CT" (versus "the 53 patients identified by PET-CT" referenced in this finding) and a "27.8% detection rate" (versus the "28.3% detection rate" referenced in this finding). The source of the

proposed finding appears to be a calculation of some sort performed by Dr. Cote using numbers derived from a source other than the specific page and Figure cited. Respondents themselves apparently believe that Dr. Cote used inaccurate numbers for that calculation because Respondents changed Dr. Cote's numbers for purposes of this finding. The finding is inherently unreliable and should be disregarded.

> 426.4 Full-body PET-CT is a fairly poor tool for cancer signal of origin determination, compared with the 88.7% accuracy of cancer signal of origin prediction achieved by GRAIL's Galleri v1 in the CCGA3 study. (RX3869 (Cote Expert Report) at n. 240.)

Response to Finding No. 426.4

The proposed finding, which consists of language copied and pasted verbatim from Dr. Cote's expert report, is vague, misleading, unsupported, and unreliable. The proposed finding is vague because the term "fairly poor" is undefined.

The proposed finding is also misleading because the actual sentence in Dr. Cote's report begins: "*Therefore*, full-body PET-CT is a fairly poor tool . . . ." (RX3869 (Cote Expert Report) at n. 240 (emphasis added)). Dr. Cote is referencing the previous sentence from footnote 240 of his report, which Respondents pasted in (nearly) verbatim as Proposed Finding No. 426.3. As noted in Complaint Counsel's response to Respondents' Proposed Finding No. 426.3, that finding is unsupported, misleading, and inherently unreliable because Respondents pasted Dr. Cote's language into the finding while changing the specific numbers from his report. Respondents then misleadingly attributed the (changed) calculation to the authors themselves (Lennon et al.) rather than to Dr. Cote. (*See* Response to RPFF ¶ 426.3 above).

No citation is provided for the "88.7% accuracy" number included in the proposed citation; that portion of the proposed finding is unsupported. [redacted]

[redacted]

[redacted] Any attempt to compare Galleri's CSO performance in CCGA against PET-CT's performance in a study that *did* involve an asymptomatic screening population, that *included* false positives when assessing PET-CT performance, and that *only* included predictions as correct when they were actually correct is inherently unreliable and misleading.

Moreover, even setting aside the numerous issues noted above, Dr. Cote is not even purporting to compare apples-to-apples. He is comparing a "detection rate" to an "accuracy" figure. Such a comparison is irrelevant and has no probative value. Certainly, it has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This finding should be accorded no weight by this court.

[redacted] Further, Dr. Cote is neither a board-certified medical oncologist nor a primary care physician, as such it is not within his job to order workup for patients who have tested positive for cancer. (Cote, Tr. 3978-79). [redacted]

427. To date, CancerSEEK has been studied in two trials: Cohen, a case-control study conducted by Thrive's founders at Johns Hopkins University involving 1817 participants (1005 cancer patients and 812 healthy individuals), and Lennon, the prospective, interventional DETECT-A (Detecting cancers Earlier Through Elective mutation-based blood Collection and Testing) study conducted by Thrive involving 10,006 female participants. (RX3142 (Cohen 2018) at 1; RX3419 (Lennon et al., 2020) at 2); [redacted]

Response to Finding No. 427

[redacted]

428. Although all cancer types (with some exclusions) were purportedly included in the DETECT-A study, in fact the nature of the assay (focusing on 16 genes and 9 protein biomarkers) was such that it was clearly designed to focus on only a few cancers that might be detected in a liquid biopsy screening test using those limited markers. (RX3419 (Lennon et al., 2020) at 2–4.)

Response to Finding No. 428

The proposed finding is vague, misleading, mischaracterizes the evidence, and is unsupported and improper. The proposed finding is vague because the terms "all cancer types (with some exclusions)," "nature of the assay," "clearly designed," and "only a few" are ambiguous and undefined.

[redacted]. Respondents mischaracterize RX3419. The authors of RX3419 say nothing about the assay being "clearly designed to focus on only a few cancers," "limited markers," or anything similar. The proposed finding is improper, unreliable, unsupported, and should be accorded no weight.

429. The study only detected cancers of 10 organs: lymphoma, colorectal, appendix, uterine, thyroid, kidney, lung, breast, ovary and cancer of unknown primary. (RX3419 (Lennon et al., 2020) at 4, 6–7, 9; Lengauer (Exact/Thrive) Tr. 243, 260–61.)

Response to Finding No. 429

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is copied and pasted verbatim from Dr. Cote's report (RX3869 (Cote Report) ¶ 177), even though Respondents do not attribute it to Dr. Cote.

[redacted]. In fact, the opposite is the case. Galleri has been shown to detect seven types of Stage I-III cancer in an asymptomatic screening population. (RX3041 at 005 (Tomasz Beer, Interim Results of Pathfinder, a Clinical Use Study Using a Methylation-Based Multi-Cancer Early Detection Test, June 4, 2021) (showing seven cancers as being detected in Stages I-III: head and neck, liver/bile duct, lung, lymphoma, ovary, pancreas, and small intestine); *see also* Cote Tr. 4000-01). By comparison, Thrive's CancerSEEK test has been shown to detect eight types of Stage I-III cancer in an asymptomatic screening population. (*See* RX3419 (Lennon et al., Feasibility of Blood Testing

Combined with PET-CT to Screen for Cancer and Guide Intervention, *Science* 369, 49 (2020) at 6-7, Table 1) (showing eight cancers as being detected in Stages I-III: ovary, lung, uterine, thyroid, colorectal, breast, lymphoma, and kidney). Therefore, this Court should disregard the proposed finding.

> 429.1 Based on these results and the assay design itself, the evidence does not support the proposition that CancerSEEK currently detects the same number of cancer types as GRAIL's Galleri test. (RX3869 (Cote Expert Report) ¶ 177.)

Response to Finding No. 429.1

The proposed finding is vague and misleading. The proposed finding is vague because the terms "these results," "the assay design itself," and "the evidence" are undefined and ambiguous.

The proposed finding is also misleading to the extent that it is meant to suggest that CancerSEEK is capable of detecting fewer cancers early in a screening setting than Grail. In fact, the opposite is the case. Galleri has been shown to detect seven types of Stage I-III cancer in an asymptomatic screening population. (RX3041 at 005 (Tomasz Beer, Interim Results of Pathfinder, a Clinical Use Study Using a Methylation-Based Multi-Cancer Early Detection Test, June 4, 2021) (showing seven cancers as being detected in Stages I-III: head and neck, liver/bile duct, lung, lymphoma, ovary, pancreas, and small intestine); *see also* Cote Tr. 4000-01). By comparison, Thrive's CancerSEEK test has been shown to detect eight types of Stage I-III cancer in an asymptomatic screening population. (*See* RX3419 (Lennon et al., Feasibility of Blood Testing Combined with PET-CT to Screen for Cancer and Guide Intervention, *Science* 369, 49 (2020) at 6-7, Table 1) (showing eight cancers as being detected in Stages I-III: ovary, lung, uterine, thyroid, colorectal, breast, lymphoma, and kidney).

Any attempt to compare the number of cancers "detected" in DETECT-A (an interventional study involving asymptomatic individuals) with CCGA (a case-control study

involving diagnosed cancer patients, including patients with Stage IV cancer) is misleading and unreliable. They are fundamentally different types of studies. Dr. Ofman of Grail conceded that "[t]o find all 50 cancer types in a real-world population would require hundreds of thousands of people[.]" (RPFF ¶ 398.4 (quoting Ofman (Grail) Tr. 3298). [redacted] (*See, e.g.,* RPFF ¶ 342 (stating that Galleri "is designed to detect cancer . . . before a patient ever shows symptoms"); CCFF ¶ 640 [redacted] The fact that Galleri can detect signals for certain cancers among individuals who have already been diagnosed with cancer does not support Galleri's ability to detect those cancers in an asymptomatic screening population. [redacted] In their own proposed findings of fact, Respondents admit that "for an early cancer screening test, whose target population comprises asymptomatic individuals who do not have a diagnosis of cancer, the clinical study cannot use samples from cancer patients" if it is to represent "valid scientific evidence used to determine the effectiveness of a device." (*See* RPFF ¶¶ 319-320). Therefore, this Court should disregard the proposed finding.

430. [redacted]

Response to Finding No. 430

[redacted]

[redacted]

430.1 CancerSEEK is unable to detect several cancers that Galleri has detected. (*Compare* RX3419 (Lennon et al., 2020) at 1, 6–7, 9 *with* (RX3409 (Klein et al., 2021) at 1, 5; Cote Tr. 3818–19.)

[redacted]

Response to Finding No. 430.1

The proposed finding is vague, misleading, unsupported, and violates the Court's Post-Trial Order. The proposed finding is vague because the phrases "unable to detect" and "has detected" are vague and undefined.

The proposed finding is misleading because any attempt to compare the number of cancers "detected" in DETECT-A (an interventional study involving asymptomatic individuals) with CCGA (a case-control study involving diagnosed cancer patients, including patients with Stage IV cancer) is misleading and unreliable. They are fundamentally different types of studies. Dr. Ofman of Grail conceded that "[t]o find all 50 cancer types in a real-world population would require hundreds of thousands of people[.]" (RPFF ¶ 398.4 (quoting Ofman (Grail) Tr. 3298).

[redacted]

(*See, e.g.,* RPFF ¶ 342 (stating that Galleri "is designed to detect cancer . . . before a patient ever shows symptoms"); [redacted] The fact that Galleri can detect signals for certain cancers among individuals who have already been diagnosed with cancer does not support Galleri's ability to detect those cancers in an asymptomatic screening population. [redacted]

[redacted]

[redacted] In their own proposed findings of fact, Respondents admit that "for an early cancer screening test, whose target population comprises asymptomatic individuals who do not have a diagnosis of cancer, the clinical study cannot use samples from cancer patients" if it is to represent "valid scientific evidence used to determine the effectiveness of a device." (*See* RPFF ¶¶ 319-320).

[redacted]

The proposed finding also includes an improper demonstrative. This Court ordered that no Party shall cite to evidence that was determined at trial to be "disregarded" or "not considered" or otherwise not in evidence. Here Respondents reproduce RDX0014-51 in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3. The specific image presented in the demonstrative does not appear in the sources cited, meaning the only citation provided by Respondents for the figure is the RDX number itself. This Court should disregard this evidence. *See* Chicago Bridge & Iron Co., Dkt 9300. *See* 2003 FTC LEXIS 98 (June 12, 2003) (striking unadmitted exhibits cited in findings of fact). The inclusion of the figure is itself misleading because it incorrectly suggests that the image presented is from the sources cited in the proposed finding. Therefore, this Court should disregard the proposed finding.

431. In the DETECT-A study, CancerSEEK obtained specificities of 95.3% in its baseline blood test (that is, with a single blood test), 98.9% with both baseline and confirmational blood tests (two blood tests) *without* PET-CT imaging, and 99.6% with both blood tests and PET-CT imaging, and sensitivity of 30.2% in its baseline blood test, 27.1% with

both baseline and confirmational blood tests *without* PET-CT imaging, and 15.6% with both blood tests and PET-CT imaging. (RX3419 (Lennon et al., 2020) at 8 & Table 2.)

Response to Finding No. 431

Complaint Counsel does not disagree with the proposed finding.

432. Assessed using another test benchmark, CancerSEEK obtained PPV (positive predictive value) of 5.9% with its single baseline blood test, 19.4% with baseline and confirmational blood tests *without* PET-CT imaging, and 28.3% with both blood tests and PET-CT imaging. (RX3419 (Lennon et al., 2020) at 8 & Table 2; Lengauer (Exact/Thrive) Tr. 257–59; RX3869 (Cote Expert Report) ¶ 178.)

Response to Finding No. 432

The proposed finding is vague because the term "another test benchmark" is vague and undefined. Complaint Counsel does not disagree that the factual statistics presented correspond with the statistics reported in Table 2 of RX3419.

433. [redacted]

Response to Finding No. 433

Complaint Counsel does not disagree with the proposed finding.

434. [redacted]

Response to Finding No. 434

The proposed finding is vague because it does not define the term "support the PMA application." Therefore, this Court should disregard the proposed finding.

434.1 [redacted]

[redacted]

Response to Finding No. 434.1

[redacted]

435. [redacted]

Response to Finding No. 435

The proposed finding is vague because it does not define the terms "under evaluation," "could be important," or "recognized." In addition, Dr. Cote is not a credible witness, so his opinion does not deserve any weight. Dr. Cote offered opinion testimony in this matter that spans multiple disparate subjects and exceeds his expertise; his trial testimony also contained unsupported claims about his experience related to MCED test development that exceed the information disclosed in his report in violation of this Court's order; and his previous prediction of upstream entry was wrong casting doubt on similar analysis in this case. (*See* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects)). Therefore, this Court should disregard the proposed finding.

436. [redacted]

[redacted]

Response to Finding No. 436

The proposed finding is confusing because it contains two separate, unrelated statements. The proposed finding is also vague because it does not define the term "committed." [redacted]

437. [redacted]

Response to Finding No. 437

Complaint Counsel does not disagree with the proposed finding.

438. [redacted]

Response to Finding No. 438

[redacted]

[redacted]

438.1 The inability of CancerSEEK to identify the cancer signal of origin through liquid biopsy alone is a key differentiator and means that if CancerSEEK were to launch today in its current form, it is unlikely to be a close substitute for GRAIL's Galleri test. (Cote Tr. 3814; PX6097 (Abrams Expert Report) ¶ 38.)

Response to Finding No. 438.1

The proposed finding is vague, mischaracterizes the cited evidence, is unsupported, relies on improper expert opinion, and is misleading and against the weight of evidence. The proposed finding is vague because the terms "cancer signal of origin" "key differentiator," and "close substitute" are undefined. The term "cancer signal of origin is not generally used by companies other than Grail.

The proposed finding mischaracterizes the cited evidence. Neither Dr. Cote nor Dr. Abrams refers to the presence or absence of "cancer signal of origin through liquid biopsy alone" as a "key differentiator" and neither opines on whether CancerSEEK would be a "close substitute" for Galleri in the citations referenced. The proposed finding is thus unsupported. Additionally, neither Drs Cote nor Abrams are qualified to provide expert opinion about whether other MCED tests will compete in the same market with the Galleri test because neither is an economist. (*See* Response to RPFF ¶ 1959, above (examining Dr. Cote's lack of qualifications on subject of market definition)). Dr. Abrams is also too biased and unqualified to opine on

whether or how the decision-making of physicians besides himself will be impacted by tests providing accurate cancer signal of origin. (*See* Response to RPFF ¶ 2032, below (examining Dr. Abrams's bias towards Grail and his lack of qualifications on how other physicians besides himself will make decisions regarding Galleri and other MCED tests)).

The proposed finding is also misleading to the extent it suggests that Galleri's algorithmic cancer signal of origin prediction is capable of definitively localizing cancer "through liquid biopsy alone." Reliable clinical data does not exist about how Grail's cancer signal of origin feature would perform in an asymptomatic screening population. The Galleri CSO accuracy numbers reported in CCGA-3 do not indicate the likelihood that a particular CSO prediction accurately identifies the location of an individual's' cancer because (1) CCGA did not involve an asymptomatic screening population, (2) the study excluded false positives when assessing CSO accuracy, and (3) Grail counts Galleri's CSO predictions as "correct" *even in instances when Galleri does not actually identify the location of the underlying cancer*. (*See* Complaint Counsel's Post-Trial Reply Brief at 50-54). Additionally, a positive Galleri result "requires confirmatory diagnostic evaluation by medically established procedures (*e.g.* imaging) to confirm cancer," *notwithstanding* Galleri's "cancer signal of origin" feature. (PX0063 at 002 (Grail, https://grail.com/galleri/, accessed on Apr. 29, 2021). Indeed, Grail's CEO, Hans Bishop, admitted at trial that certain patients may have to undergo a body scan following a positive Galleri test to identify the cancer tissue of origin. (Bishop (Grail) Tr. 1387.)

Interim results from PATHFINDER, an actual interventional trial for Galleri, indicate that additional imaging testing was required for positive results 90 percent of the time. (RX3041 at 001 (Tomasz M. Beer, Interim Results of PATHFINDER, a Clinical Use Study Using a Methylation-Based Multi-Cancer Early Detection Test, 2021 ASCO Annual Meeting

Presentation, June 4, 2021) ("Most participants with diagnostic resolution had at least 1 imaging test (57/63; 90%)."). Over half the positive results in PATHFINDER with diagnostic resolution were determined to be false positives (55.4%) and 25 percent of participants who received falsely positive results underwent at least one invasive procedure. (RX3041 at 004 (Tomasz M. Beer, Interim Results of PATHFINDER, a Clinical Use Study Using a Methylation-Based Multi-Cancer Early Detection Test, 2021 ASCO Annual Meeting Presentation, June 4, 2021)).

b. Freenome's Colorectal Cancer Screening Test

471. Freenome is currently developing a blood biopsy colorectal cancer screening test by combines data from whole-genome sequencing, DNA methylation, and protein quantification using a multiomics approach. (RX3426 (Lin et al., 2021); RX3592 (Putcha et al., 2020).) Freenome is able to achieve single cancer specificity of 94% with sensitivity of 91% using this multiomics approach. (RX3869 (Cote Expert Report) ¶ 199.)

Response to Finding No. 471

The proposed finding relies on improper expert opinion. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only source of evidence supporting the fact that "Freenome is able to achieve single cancer specificity of 94% with sensitivity of 91% using this multiomics approach" in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

472. Freenome is currently conducting a 14,000–participant, prospective, observational cohort study to validate its blood-based multiomics test for the early detection of colorectal cancer. (RX3132 (Freenome).) [redacted]

Response to Finding No. 472

Complaint Counsel objects to Respondents' misattribution of RX3132 (which appears to be an internet printout Respondents generated in July of 2021 from clinicaltrials.gov) to Freenome as the source of the document in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3. Therefore, this Court should disregard the proposed finding.

4. Guardant Health

473. Guardant Health ("Guardant") is a molecular diagnostics company based in Redwood City, California. (RX3472 (Guardant) at 4.) Guardant was founded in 2011, and launched its first product, a therapy selection test around the same time. (RX3472 (Guardant) at

4; PX7045 (Chudova (Guardant) IHT at 17).) [redacted]

Response to Finding No. 473

Complaint Counsel objects to Respondents' misattribution of RX3472 (which Respondents note on JX2 is, in fact, a printout from www.nasdaq.com) to Guardant as the source of the document in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3. Therefore, this Court should disregard the proposed finding.

480. Guardant has also testified that its "platform in its foundation doesn't have anything specific for [] individual cancer types other than selection of the regions of the genomes that are most representative for that specific cancer." (PX7100 (Chudova (Guardant) Dep. at 24).)

Response to Finding No. 480

The proposed finding is vague and incomplete. The proposed finding is vague because it refers to testimony by "Guardant," rather than to the individual testimony of Dr. Chudova. The proposed finding is also incomplete. Dr. Chudova testified that Guardant's "platform in its

foundation doesn't have anything specific for an individual cancer types other than selection of the regions of the genomes that are most representative for that specific cancer. But that's a minor aspect of the technology, and it can be adapted to other cancer types." (PX7100 (Chudova (Guardant) Dep. at 24)). Therefore, this Court should disregard the proposed finding.

481. Guardant also acknowledged that "[t]here's also [the] possibility that we would need to bring other biomarkers to support the sensitivity and specificity requirements in those other cancers, but that's an area of development at this point." (PX7100 (Chudova (Guardant) Dep. at 23–24, 26); RX3869 (Cote Expert Report) ¶ 205).

Response to Finding No. 481

b. Guardant's LUNAR-2 Colorectal Cancer Screening Tests

486. Guardant is currently developing an NGS-based blood biopsy early cancer screening test using genomic and methylation signatures called LUNAR-2, to detect and screening for early-stage colorectal cancer. (RX3296 (Guardant) at 7.)

Response to Finding No. 486

The proposed finding is incomplete and misleading. Complaint Counsel does not disagree that Guardant is developing an NGS-based liquid biopsy early cancer screening test called LUNAR-2 that uses genomic and methylation signatures. The proposed finding is incomplete and misleading, however, to the extent it suggests that LUNAR-2 is only intended to screen for early-stage colorectal cancer. [redacted]

[redacted]

[redacted]

The proposed finding is also misleading because—like numerous of Respondents' other proposed findings—it is copied and pasted verbatim from Dr. Cote's report (RX3869 (Cote Report) ¶ 209), even though Respondents do not attribute it to Dr. Cote. With the exception of the specific language noted with which Complaint Counsel does not disagree, this Court should disregard the proposed finding.

> 486.1 In 2019, Guardant reported a 107–participant study with 72 patients with Stage I–IV colorectal cancer and 35 age-matched cancer-free individuals. (RX3405 (Kim et al., 2019) at 1–2.) The LUNAR-2 test was 94% sensitive at 94% specificity, with sensitivity at 97% in Stage I/II, 90% in Stage III, and 100% in stage IV. (RX3405 (Kim et al., 2019) at 2).) The authors also found that DNA methylation analysis significantly enhanced ctDNA detection relative to somatic mutational analysis alone (94% vs. 56%; $p<0.0001$). (RX3405 (Kim et al., 2019) at 2).)

Response to Finding No. 486.1

The proposed finding is misleading and mischaracterizes the source cited, which is itself

unreliable hearsay.

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is copied and pasted verbatim from Dr. Cote's report (RX3869 (Cote Report) ¶ 209), even though Respondents do not attribute it to Dr. Cote. Rather, Respondents attempt to improperly misattribute Dr. Cote's statements to the "authors" of RX3405 (Kim et al.). Moreover, Respondents cite only to a an abstract rather than the full study and fail to disclose the specific source from which the abstract was printed. An abstract of unknown provenance that was not produced by Guardant itself is not a reliable source of what "Guardant reported."

Additionally, Respondents mischaracterize the contents of the cited abstract itself. Respondents assert that the LUNAR-2 test "was 94% sensitive at 94% specificity." In fact, the abstract states that those sensitivity and specificity numbers were for "early stage CRC (I-III)" *only*. The stated performance of the LUNAR-2 test for early stage CRC is thus superior to that implied by Respondents' inaccurate summary of the abstract (given that the sensitivity noted for Stage IV patients was 100%). The Court should thus disregard the proposed finding.

> 486.2 In 2020, Guardant reported a 205–participant study with 113 patients with stage I-III colorectal cancer and 88 age-matched colonoscopy screen-negative individuals. (RX3740 (Westesson et al., 2020) at 2); (RX3869 (Cote Expert Report) ¶ 209). The LUNAR-2 test was 90.3% sensitive at 96.6% specificity, with sensitivity at 90% in Stage I; 88% in Stage II; 96% in Stage III. (RX3740 (Westesson et al., 2020) at 2); (RX3869 (Cote Expert Report) ¶ 209.)

Response to Finding No. 486.2

The proposed finding is misleading and mischaracterizes the source cited, which is itself unreliable hearsay.

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is copied and pasted from Dr. Cote's report (RX3869 (Cote Report) ¶

209), even though Respondents do not attribute it to Dr. Cote. Rather, Respondents attempt to improperly misattribute Dr. Cote's statements to the "authors" of RX3740 (Westesson et al.). Moreover, Respondents cite only to a an abstract rather than the full study that was apparently printed by Respondents off of the internet. An abstract that was not produced by Guardant itself is not a reliable source of what "Guardant reported."

Additionally, Respondents mischaracterize the contents of the cited abstract itself. Respondents assert that Westesson et al. involved a "205-participant study." In fact, the abstract states that "blood samples were collected from 162 patients with a known diagnosis of CRC . . ., 38 self-declared cancer-free donors, *and* 205 individuals who were screen-negative for advanced neoplasia by colonoscopy." Those numbers total to 405, not 205. Complaint Counsel does not disagree that the sensitivities and specificity listed in the proposed finding correspond to the numbers listed in the abstract, but reiterates its objection to the use of an abstract printed off the internet as evidence about what Guardant specifically reported. The Court should disregard the proposed finding.

487. In 2019, Guardant initiated the approximately 10,000–participant ECLIPSE prospective observational trial to evaluate the performance of the LUNAR-2 colorectal cancer screening test and support its submission to the FDA. (RX3128 (Guardant) at 1–2; Chudova (Guardant) Tr. 1155, [redacted] ECLIPSE is expected to complete enrollment in 2021. (RX3296 (Guardant Health, Solutions) at 7; Chudova (Guardant) Tr. 1155, [redacted]

Response to Finding No. 487

Complaint Counsel does not disagree with the proposed finding.

487.1 The ECLIPSE trial's population consists of patients undergoing regular screening procedures for colorectal cancer using colonoscopy, and the aim of the study is to be able to assess performance of Guardant's CRC screening device in comparison to standard of care, which is colonoscopy. (Chudova (Guardant) Tr. 1189; PX7100 (Chudova (Guardant) Dep. at 32–33); (RX3869 (Cote Expert Report) ¶ 210.)

Response to Finding No. 487.1

Complaint Counsel does not disagree with the proposed finding.

488. Guardant has completed a 40–participant, prospective observational pilot study in lung cancer, and is conducting a 590–participant, prospective observational study in the U.S. and a 700 participant, prospective observational study in South Korea to evaluate the LUNAR-2 test in lung cancer. (RX3125 (Guardant) at 1–2); RX3122 (Guardant); RX3124 (Guardant); (RX3869 (Cote Expert Report) ¶ 211.)

Response to Finding No. 488

Complaint Counsel does not disagree with the specific statements made in the proposed finding; the proposed finding is incomplete, however, in that Guardant has completed many studies beyond those specifically listed in the proposed finding. (Complaint Counsel notes that Respondents themselves do not represent that the studies listed are the only studies that Guardant has completed.) Complaint Counsel also notes for completeness that RX3125, RX3122, and RX3124 were not produced by Guardant (as Respondents' citations suggest) but rather appear to have been printed from the internet by Respondents themselves.

489. [redacted]

Response to Finding No. 489

[redacted]

490. [redacted]

Response to Finding No. 490

[redacted]

[redacted]

c. Guardant's Other Oncology Test Development Efforts

491. Guardant currently markets the following types of oncology tests: Guardant360® CDx, a 61–gene panel, FDA-approved therapy selection test; Guardant360® LDT, an 80–gene panel therapy selection test; GuardantOMNI, a 500–gene panel therapy selection test; and Guardant Reveal, an MRD monitoring test. (RX3219 (Guardant)*;* RX3295 (Guardant); (RX3869 (Cote Expert Report) ¶ 214.)

Response to Finding No. 491

Complaint Counsel does not disagree that Guardant currently markets the oncology tests identified in the proposed finding. Complaint Counsel objects to any further characterizations of those tests, such as the numbers of genes on various panels. This Court ordered that "[w]hen citing to exhibits, the parties shall identify the document by the PX or RX number, followed by the name of the entity that produced the document, and the page number." Order on Post-Trial Findings at 3. Respondents' citations to RX3219 (a 94-page document) and RX3295 (a 6-page document) do not identify specific page numbers. The citations thus violate the Court's Order and the Court should disregard the proposed evidence. [redacted]

492. Guardant's Guardant360® CDx, Guardant360® LDT and GuardantOMNI tests are therapy selection tests based on NGS sequencing of genomic materials, and would not be sensitive enough for multi-cancer screening tests. (RX3869 (Cote Expert Report) ¶ 215.)

Response to Finding No. 492

The proposed finding, which consists of language copied and pasted from Dr. Cote's report, relies on improper expert opinion. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only source of

evidence supporting the facts in the proposed finding in contravention of this Court's Order. This Court should disregard this evidence.

Furthermore, Dr. Cote is not qualified to provide expert opinion testimony about the process for developing a multicancer screening test because he has no experience developing such tests. [redacted] This Court should not accord Dr. Cote's opinion any weight. In addition to Dr. Cote being unqualified, his opinion about the potential for particular tests to be used as a basis for adaptation and development into MCED tests is unreliable given that he does not even purport to apply any specific methodology to reach his conclusion, let alone one that is reflected in any peer reviewed publication, supported by any well-known regulatory guidance or scientific standard, or accepted by any relevant scientific community.

5. Helio Health

493. Helio Health (formerly known as Laboratory for Advanced Medicine ("LAM")) is a molecular diagnostics company based in Irvine, California. (RX3310 (Helio) at 1, 5; Chahine (Helio) Tr. 1001.) It also has an office in Beijing, China. (RX3310 (Helio) at 1,5.) LAM was founded in 2014. [redacted]

498. There is no indication based on Helio Health's work to date that Helio Health will be a competitor to GRAIL in the foreseeable future, and depending on the test that Helio Health develops in the future, it is unclear if it will be a competitor to GRAIL or will develop a complementary test. (RX3869 (Cote Expert Report) ¶ 217; [redacted]

Response to Finding No. 498

[redacted]

[redacted]

499. [redacted] Helio discloses that its pipeline of cancer testing and screening products, includes tests for colon, breast, lung and "multi-cancer" indications. (RX3308 (Helio) at 1.) Both Helio's recent announcements, as well as its prior work on IvyGene, shows that it has only ever studied four cancers: breast, colon, liver, nasopharyngeal and lung. (RX3302 (Hao et al., 2017); RX3308 (Helio) at 2); RX3616 (Roy et al., 2019).)

Response to Finding No. 499

[redacted]

[redacted]

[redacted]

500. [redacted]

Response to Finding No. 500

[redacted]

[redacted]

501. [redacted]

Response to Finding No. 501

[redacted]

[redacted]

[redacted]

[redacted]

501.1 Helio was previously developing a multi-cancer screening test called IvyGene but has since abandoned those efforts. (PX7077 (Chahine (Helio) Dep. at 218); RX3417 (Helio); RX3263 (GenomeWeb) at 1; RX3869 (Cote Expert Report) n. 334.)

Response to Finding No. 501.1

The proposed finding, which consists of language copied and pasted verbatim from Dr. Cote's report, is vague, mischaracterizes the evidence, and is unsupported. The proposed finding is vague because the phrase "abandoned those efforts" is ambiguous and undefined.

There is no page 218 of the Chahine Deposition. Respondents' citation to PX7077 at 218 fails to support the proposed finding. The suggestion that a nonexistent page of a deposition transcript supports a factual finding is itself misleading.

RX3417 describes IvyGene as a test but does not indicate any "abandonment" of "efforts" by Helio. RX3263 appears to be an article from a website called "genomeweb.com" titled "Helio Health Aims to Market Blood-Based Liver Cancer Screening Assay in Early 2021." The "genomeweb.com" article merely states that Helio "has discontinued" its IvyGene assay in

favor of commercializing it Helio Liver Test. (RX3263 (GenomeWeb) at 1). It says nothing about Helio "abandoning" its "efforts" related to IvyGene.

The only other source for the proposed finding is the expert report of Dr. Cote. This Court ordered, however, that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote to support factual propositions in contravention of this Court's Order. The Court should disregard this evidence.

502. Dr. Scott Morton has not presented any evidence showing that the Helio two cancer-type test (or even a test screening for five cancer types), including many cancers with an existing cancer screening test, is a close substitute of the Galleri test, which simultaneously screens for more than 50 cancer types, 45 of which have no current screening test. (RX3869 (Cote Expert Report) ¶ 219; [redacted]

Response to Finding No. 502

[redacted]

[redacted]

[redacted]

503. In 2020, Helio Health renamed the IvyGene liver cancer panel to the "Helio Liver Test," and aims to market it in early 2021 as an LDT, followed by an FDA-approved test in 2022. (RX3263 (GenomeWeb) at 1.)

Response to Finding No. 503

Complaint Counsel has no specific response to the proposed finding.

504. In addition to NGS-based cfDNA methylation biomarkers, Helio is also using ELISA to identify protein biomarkers linked to liver cancer, including the alpha-fetoprotein (AFP). (RX3263 (GenomeWeb) at 1.)

Response to Finding No. 504

The proposed finding is vague, misleading, and unreliable. The proposed finding is vague because the term "ELISA" is not defined.

[redacted] Dr. Cote appears to have based his statement on RX3263, which appears to be an article printed from a website called "genomeweb.com." Helio did not produce RX3263. Respondents' reliance on a purported factual statement by their expert based solely on his internet research is inherently unreliable.

[redacted] However, this Court should disregard this proposed finding as specifically phrased for the reasons stated above.

505. Helio is taking a multiomics approach, by combining methylation data, protein biomarkers and patients' demographic information using an AI algorithm to determine whether the patient has early-stage liver cancer. (RX3869 (Cote Expert Report) ¶ 220.)

Response to Finding No. 505

The proposed finding, which consists of language copied and pasted verbatim from Dr. Cote's report, relies on improper expert opinion. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote to support purely factual propositions in contravention of this Court's Order. The Court should disregard this evidence.

505.1 Helio is pursuing a path of using very limited numbers of biomarkers, (9, 8, 5 and even one), and has done some of their clinical studies not with NGS but with ddPCR. (*See* RX3747 (Xu et al 2017); RX3436 (Luo et al 2020).).

Response to Finding No. 505.1

The proposed finding, which consists of language copied and pasted from Dr. Cote's report, is vague, misleading, violates the Court's Post-Trial Order, and is against the weight of evidence. The proposed finding is vague because it does not define the terms "pursuing a path," "some," and "very limited."

[redacted] Respondents' attempts to impute Dr. Cote's views (*e.g.*, "very limited") to the authors of the studies cited is improper and unsupported.

Respondents' citations to RX3747 and RX3436 violate this Court's Post-Trial Order. This Court ordered that "[w]hen citing to exhibits, the parties shall identify the document by the PX or RX number, followed by the name of the entity that produced the document, and the page number." Order on Post-Trial Findings at 3. Respondents' citations to RX3747 (an 8-page

document) and RX3295 (a 12-page document) fail to identify specific page numbers. The citations thus violate the Court's Order and the Court should disregard the proposed evidence. Additionally, RX3747 and RX3436 appear to be academic articles and were not produced by Helio. Respondents' (Dr. Cote's) citation to these articles does not provide reliable evidence of what Helio, as a corporate entity "is pursuing."

[redacted]

[redacted] For all the above reasons, the Court should disregard the proposed finding.

506. Helio (and LAM) have conducted a few different trials relating to its liver cancer test, including certain trials relying on Bio-Rad's droplet digital platform (ddPCR) rather than NGS. (RX3265 (GenomeWeb) at 1.)

Response to Finding No. 506

The proposed finding, which consists of language copied and pasted verbatim from Dr. Cote's report, is vague, misleading, and against the weight of evidence. The proposed finding is vague because the phrase "a few different trials" is imprecise and ambiguous, as is the phrase "certain trials."

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is copied and pasted verbatim from Dr. Cote's report (RX3869 (Cote Report) ¶ 221), even though Respondents do not attribute it to Dr. Cote, and represents his opinion and characterization. Dr. Cote appears to have based his statement on RX3265, which appears to be an article printed from a website called "genomeweb.com." That article was from 2017 and thus obviously does not represent the current state or status of Helio/LAM's research and development efforts.

[redacted]

[redacted]

506.1 In March 2019, LAM presented results of a blinded validation study to evaluate individual panels of DNA methylation markers developed for the detection of liver cancer. (RX3617 (Roy et al., 2019).) In the 154 participant liver cancer panel study with 60 Stage I–IV liver cancer patients, 30 patients of another cancer type, 10 patients with benign liver disease and 30 healthy individuals, the IvyGene liver cancer panel showed an overall sensitivity of 95% and specificity of 97.5%. (RX3617 (Roy et al., 2019); (RX3869 (Cote Expert Report) ¶ 221.)

Response to Finding No. 506.1

The proposed finding is misleading and based on unreliable hearsay. The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is copied and pasted verbatim from Dr. Cote's report, even though Respondents do not attribute it to Dr. Cote by quotation. (RX3869 (Cote Report) ¶ 221). The only other source cited for the proposed finding is a document of unknown provenance and authenticity that Respondents appear to have printed from the internet. Though no URL address or other information on the source of the proposed finding appears on the document itself, Respondents claim on JX2 that the document was derived from some website called abstractsonline.com. The document was not produced by LAM. Complaint Counsel has no idea who or what abstractsonline.com is. The document certainly is not a full study and was not produced by "Roy et al." An abstract of unknown provenance that was not produced by LAM itself is not a reliable source of what "LAM presented." The underlying source is unreliable hearsay and the Court should disregard the proposed finding.

506.2 In November 2020, Helio presented results of a prospective validation study to evaluate the Helio Liver Test, together with protein markers and demographics, for the detection of liver, breast or colorectal cancers. (RX3618 (Roy et al., 2020).) In the 631–participant study with 291 liver cancer patients and 340 age-matched healthy controls, the multiomics test achieved an overall sensitivity of 93.0% and a specificity of 95.6%, with sensitivities for Stages I, II, III and IV at 77.8%, 99.8%, 96.8%, and 98.6%, respectively, at a 95% specificity. (RX3618 (Roy et al., 2020).)

Response to Finding No. 506.2

The proposed finding, which is pasted verbatim from Dr. Cote's report, is vague and misleading. The proposed finding is vague because the phrase "together with protein markers and demographics" is undefined; it is unclear what the term "demographics" means in the context in which it is used.

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is copied and pasted verbatim from Dr. Cote's report (RX3869 (Cote Report) ¶ 221), even though Respondents do not attribute it to Dr. Cote, and represents his characterizations rather than the language used in the underlying source. For example, RX3618 refers specifically to "hepatocellular carcinoma (HCC)," not "liver cancer." Heptacellular carcinoma is one form of liver cancer; but it is not coterminous with all "liver cancer." The proposed finding's use of Dr. Cote's terminology thus fails to convey precisely the information contained in the underlying document. Complaint Counsel objects to Respondents' unattributed use of expert characterization to attempt to establish fact testimony. Therefore, this Court should disregard the proposed finding.

506.3 Helio further disclosed that the Helio Liver Test alone only achieved sensitivity of 88.7% in Stage I–II liver cancer patients, while sensitivity for AFP alone was 57.5% and for ultrasound was approximately 47%. (RX3308 (Helio) at 1; RX3869 (Cote Expert Report) ¶ 222).

Response to Finding No. 506.3

The proposed finding, which consists of language copied and pasted verbatim from Dr.

Cote's report, is misleading and relies on improper expert opinion.

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is copied and pasted verbatim from Dr. Cote's report (RX3869 (Cote Report) ¶ 222), even though Respondents do not attribute it specifically to Dr. Cote by quotation, and represents his opinion and characterization. Respondents' attempts to impute Dr. Cote's opinions (*e.g.*, "*only* achieve") to Helio is improper and unsupported.

Complaint Counsel does not disagree that the specific statistics listed in the proposed finding correspond to the numbers presented in the press release cited (RX3308). Dr. Cote's statement that the Helio Liver Test alone "only" achieved sensitivity of 88.7% for the detection of Stage I-II liver cancer, however, is itself misleading. As RX3869 notes, ultrasound is "the current standard of care for early-stage HCC detection" and achieves sensitivity of 47% for Stage I-II cancer. That means the Helio Liver Test missed Stage I-II cancers 11.3% of the time, compared to 53% of time for the current "standard of care" for early-stage HCC detection. The Helio Liver Test thus represents a remarkable increase in early-stage liver cancer detection relative to the current standard of care. Dr. Cote's use of the term "only" to attempt to minimize this accomplishment is unsupported and disingenuous.

> 506.4 In February 2019, LAM started a 1,600–participant, prospective observational CLiMB trial to compare the performance of the IvyGene Dx Liver Cancer Test with ultrasound, CT or MRI for the detection of liver cancer within a population that is at high risk for liver cancer due to liver cirrhosis. (RX3127 (Clinicaltrials.gov) at 2.) The CLiMB trial is expected to complete in 2023. (RX3127 (Clinicaltrials.gov) at 2.) The Helio-led team has enrolled at least 500 of 800 high-risk patients and anticipates releasing the results of the trial by early next year. (RX3263 (GenomeWeb) at 3.)

Response to Finding No. 506.4

The proposed finding, which is copied and pasted verbatim from Dr. Cote's report, is misleading, incorrect, and misstates the contents of both RX3127 and RX3263.

The proposed finding is misleading because—like numerous of Respondents' other

proposed findings—it is copied and pasted verbatim from Dr. Cote's report (RX3869 (Cote Report) ¶ 223), even though Respondents do not attribute it to Dr. Cote, and imputes Dr. Cote's misreading of RX3127 to the write-up of the study itself.

RX3127 states that the CLiMB trial is "designed to evaluate the performance of the IvyGene Dx Liver Cancer Test alone, ultrasound alone and the combination of both the IvyGene Dx Liver Cancer Test and ultrasound for the detection of HCC within a population that is at high risk for HCC due to liver cirrhosis." (RX3127 at 1 (ClinicalTrials.gov, Clinical Trial for the IvyGene Liver Cancer Test (CLiMB)). The document does not say anything about comparing the performance of IvyGene to "CT or MRI." Dr. Cote appears to have misunderstood or misinterpreted the ClinicalTrials.gov write-up, which explains that "[d]iagnostic imaging by CT or MRI" is one of the methods by which subjects were identified for inclusion in the study – not comparators for the performance of IvyGene. (*See* RX3127 at 4-5 (ClinicalTrials.gov, Clinical Trial for the IvyGene Liver Cancer Test (CLiMB)).

The final sentence of the proposed finding is also unsupported. The cite proffered (RX3263 at 3) fails to support any of the statements made in that sentence.

Complaint Counsel does not disagree that Helio/LAM initiated the CLiMB study in 2019, that the estimated enrollment of the study was 1,6000 participants, that the study is a prospective observational trial, that the trial is designed to compare the performance of the IvyGene Dx Liver Cancer test with *ultrasound*, or that the trial is expected to complete in 2023. The Court should disregard the remainder of the proposed finding as incorrect and/or unsupported.

> 506.5 Helio also partnered with Chinese collaborators to validate the Helio Liver Test in a blinded case-control study, called "Evaluate Methylation Markers for Detection of Liver Cancer Study" (VICTORY). (RX3308 (Helio) at 1.)

Response to Finding No. 506.5

The proposed finding, which consists of language copied and pasted verbatim from Dr.

Cote's report, is vague and unsupported.

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is copied and pasted verbatim from Dr. Cote's report (RX3869 (Cote Report) ¶ 224), even though Respondents do not attribute it to Dr. Cote. Dr. Cote himself provides no citation for his assertion in his own report.

Respondents attempt to fill in that blank by improperly misattributing Dr. Cote's statement to a Helio press release (RX3308), even though the press release fails to support the statements made by Dr. Cote. RX3308 does not mention anything about "Chinese collaborators," and the title "Evaluate Methylation Markers for Detection of Liver Cancer Study" appears nowhere in the source material.

Even if Respondents had cited Dr. Cote's report (which they do not), he could not serve as support for a factual statement under the Court's Post-Trial Order. The Court should disregard the proposed finding.

> 506.6 The study evaluated 1,093 individuals in China with liver cancer and benign liver diseases as well as healthy controls, and Helio "plan[s] to share the encouraging details of the VICTORY trial at a later date." (RX3308 (Helio) at 1.)

Response to Finding No. 506.6

Complaint Counsel has no specific response to the proposed finding.

> 506.7 The results of the VICTORY study, which has not been published yet, was used as the basis of Helio's registration submission for the Helio Liver Test in China. (RX3308 (Helio) at 1; (RX3869 (Cote Expert Report) ¶ 224).

Response to Finding No. 506.7

Complaint Counsel has no specific response to the proposed finding.

6. Natera

507. Natera, Inc. ("Natera") is a molecular diagnostics company based in San Carlos, California and Austin, Texas. (*See* PX0155 (Natera).) Natera was founded in 2004 with an

initial focus on genetic testing in women's health, including non-invasive prenatal testing ("NIPT"). (RX3488 (Natera) at 5.)

Response to Finding No. 507

[redacted]

[redacted]

511. There is no evidence based on Natera's work to date that Natera will be a competitor to GRAIL in the foreseeable future, and depending on the test that Natera develops in the future, it is unclear if it will be a competitor to GRAIL or will develop a complementary test. (RX3869 (Cote Expert Report) ¶ 227; [redacted]

Response to Finding No. 511

[redacted]

Respondents cite to paragraph 227 of Dr. Cote's report, but Dr. Cote himself provides no citation or support for his statement. [redacted]

Dr. Cote is also not a credible witness, so his opinion does not deserve any weight. Dr. Cote offered opinion testimony in this matter that spans multiple disparate subjects and exceeds his expertise; his trial testimony also contained unsupported claims about his experience related to MCED test development that exceed the information disclosed in his report in violation of this Court's order; and his previous prediction of upstream entry was wrong casting doubt on similar analysis in this case. (*See* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects)).

In addition to Dr. Cote being unqualified, his opinion is unreliable given that he does not even purport to be performing any analysis subject to or reflected in any peer reviewed publication, supported by any well-known regulatory guidance or scientific standard, or accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

[redacted]

512. To date, Natera has not published any studies relating to cancer screening. (RX3869 (Cote Expert Report) ¶ 228.) [redacted]

[redacted]

516.2 Further, Natera contends that it will be able to use the biomarkers that it has identified for its Signatera MRD test. (RX3869 (Cote Expert Report) ¶ 230.) However, Natera's CEO as recently as November 2020 stated to its investors that "Signatera technology is not something that can be used for early detection." (RX3496 (Nov. 5, 2020 Earnings Call) at 18.) [redacted]

Response to Finding No. 516.2

[redacted]

[redacted]

517. The MRD test that Natera has developed actually depends on the pre-diagnosis of cancer. (RX3869 (Cote Expert Report) ¶ 230.) The Natera MRD test is based on identifying

DNA point mutations that are specific to an individual patient's cancer, and each patient requires assessment of their cancer cells to identify the mutations that cancer might have. (*See* RX3601 (Reinert et al., 2019); RX3157 (Coombes et al., 2019); RX3118 (Christensen et al., 2019).) This type of assay is inapplicable to a cancer screening test, which is performed in asymptomatic individuals who do not have a cancer diagnosis or tumor tissue to analyze. (RX3869 (Cote Expert Report) ¶ 231.)

Response to Finding No. 517

The proposed finding, which consists of language copied and pasted verbatim from Dr. Cote's expert report, relies on improper expert testimony and violates the Court's Post-Trial Order. The first sentence of the proposed finding is a factual statement for which Respondents cite only Dr. Cote's report. This Court ordered, however, that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote to support factual propositions in contravention of this Court's Order. The Court should disregard this evidence.

The second sentence – which is also pasted directly from Dr. Cote's expert report – is improper and violates the Court's Post-Trial Order. This Court ordered that "[w]hen citing to exhibits, the parties shall identify the document by the PX or RX number, followed by the name of the entity that produced the document, and the page number." Order on Post-Trial Findings at 3. RX3601, RX3517, and RX3118 are 8-page, 31-page, and 12-page documents, respectively. Respondents provide no page citations to any of these sources. The Court should disregard this evidence.

The final sentence relies on improper expert opinion. Dr. Cote is not qualified to provide expert opinion testimony about the process for developing a multicancer screening test because he has no experience developing such tests. [redacted] In addition, Dr. Cote's opinion is unreliable. Dr. Cote's report states, with no citation whatsoever:

"*As is obvious*, this type of assay is inapplicable to a cancer screening test, which is performed in asymptomatic individuals who do not have a cancer diagnosis or tumor tissue to analyze." (RX3869 (Cote Report) ¶ 231 (emphasis added)). Claiming that something "is obvious" with no explanation, methodology, or citation is inherently unreliable. (Perhaps that is why Respondents chose to omit Dr. Cote's "As is obvious" phrase when pasting his language into the proposed finding.) Certainly, the methodology of "declaring things obvious" has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and has not been be accepted by any relevant scientific community. This proposed finding of fact should be disregarded.

518. Even if there was a way for Natera to adopt the tumor profiling results it has collected for a cancer screening test, there are several issues that would structurally impede any rapid adaptation of its findings to such an test: (RX3869 (Cote Expert Report) ¶ 232.)

Response to Finding No. 518

This proposed finding, which consists of language copied and pasted verbatim from Dr. Cote's report, relies on improper expert opinion. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote in contravention of this Court's Order.

Furthermore, Dr. Cote is not qualified to provide expert opinion testimony about the process for developing a multicancer screening test because he has no experience developing such tests. [redacted] This Court should not accord Dr. Cote's opinion any weight. In addition to Dr. Cote being unqualified, his opinion about the potential for particular tests to be used as a basis for adaptation and development into MCED tests is unreliable given that he does not even purport to apply any specific methodology to reach his conclusion, let

alone one that is reflected in any peer reviewed publication, supported by any well-known regulatory guidance or scientific standard, or accepted by any relevant scientific community.

This Court should disregard this evidence.

[redacted]

[redacted]

526. [redacted] The significance of this prior work is undermined by Natera's own subsequent

strategic decisions regarding the development of its putative cancer screening tests. (PFF ¶¶ 526.1–526.3.)

Response to Finding No. 526

[redacted]

526.1 [redacted]

Response to Finding No. 526.1

[redacted]

[redacted]

526.2 Natera's own public statements show that while Natera may have been focused on early detection around the time of its IPO, it clearly shifted its focus to MRD and has only recently turned its focus back to early detection: until its recent shift, Natera appears to have last mentioned its efforts in early detection in 2016 and 2017. (RX3495 (Natera) at 7 (discussing exploring breast and ovarian cancer screening); RX3491 (Natera) at 18.

Response to Finding No. 526.2

The proposed finding is vague, confusing, misleading, and improper. The proposed finding is vague because the phrases "focused on," "around the time," "shifted its focus," "recently," "turned its focus back," and "recent shift" and "its efforts in early detection" are all ambiguous and undefined. The proposed finding is also vague and confusing because it is unclear what Respondents mean by the phrase "Natera appears." A proposed statement of "appearance" is something other than a proposed statement of "fact" and as such the Court should disregard it.

The proposed finding is improper because it is an argument rather than a factual statement. Respondents merely cite two pages from Natera earnings calls in 2016 and 2017 (RX3495 and RX3491). The documents do not support any part of the proposed finding. They obviously cannot support Respondents' claims about supposed recent shifts in Natera's "focus" (subsequent to 2016/2017). They also cannot, by themselves, establish that Natera did not mention "its efforts in early detection" subsequently. The proposed finding is thus unsupported.

[redacted] The Court should disregard the proposed finding.

526.3 By early 2019, CEO Steve Chapman said, "I want to level set on the market opportunity and where we are positioned. ***We're not focused on asymptomatic cancers strain or early detection.***" (RX3492 (Natera) at 6.)

Response to Finding No. 526.3

[redacted]

7. **Singlera**

527. Singlera Genomics ("Singlera") is a molecular diagnostics company based in La Jolla, California. (PX2780 (Singlera) at 1.) Singlera was founded in 2014 to focus on early cancer detection. (PX7102 (Gao (Singlera) Dep. at 16, 17; 97–98).)

Response to Finding No. 527

Complaint Counsel has no specific response to this proposed finding.

528. Though Singlera has been focusing on early cancer screening for seven years, it still views itself as "early in the run." (PX7102 (Gao (Singlera) Dep. at 17).)

Response to Finding No. 528

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted verbatim from Dr. Cote's report (RX3869 (Cote Report) ¶ 237), even though Respondents do not attribute it to Dr. Cote, and represents his opinion rather than market realities.

The proposed finding is vague, as it is unclear what "still early in the run" means because it lacks any context. Moreover, the testimony was given in response to a question it appears the witness may not have fully understood. "Q. Now, in your investigational hearing, did you testify that Singlera is a – an early cancer detection company? A. Yes. And depends how we define early. It started in 2014, seven years past, but we still consider ourselves still early in the run." (PX7102 (Gao (Singlera) Dep. at 17).

The proposed finding is misleading and against the weight of the evidence to the extent Respondents imply Singlera is not actively developing its PanSeer MCED test. Singlera has already completed a proof-of-concept study of its PanSeer test in China on 100,000 people, identifying lung, esophageal, liver, colorectal, and gastric cancers at least four years before conventional diagnosis. (PX7042 (Gao (Singlera) IHT at 28-30); *see also* Gao (Singlera) Tr. 2878-79). Singlera's PanSeer MCED test is designed to detect all kinds of cancer, and not just the five cancers used in the Taizhou Longitudinal Study, with the goal of offering a "pan-cancer" test. (Gao (Singlera) Tr. 2881). Singlera has already invested between $60-100 million on the development of the PanSeer MCED test and expects to launch it as an FDA approved test by 2028. (Gao (Singlera) Tr. 2888-89; PX7042 (Gao (Singlera) IHT at 96)).

[redacted] For the above reasons, the Court should disregard the proposed finding.

529. It appears that Singlera is in the research and development stage for a cancer screening test for five cancer types, and in the clinical stage for its ColonES colorectal cancer screening test. (RX3869 (Cote Expert Report) at ¶ 237.)

Response to Finding No. 529

The proposed finding is misleading because Respondents omit an important qualification from Dr. Cote's report: [redacted] Dr. Cote's musings on "the evidence" based on the limited evidence he personally reviewed are irrelevant and represent unreliable and improper expert opinion.

The proposed finding is vague as to what is meant by "research and development stage" and "clinical stage."

The proposed finding is misleading to the extent it suggests that MCED test developers

all must follow an identical, one-size-fits-all, artificial development and commercialization roadmap and timeline that Dr. Cote invented in his flawed analysis. [redacted]

Dr. Cote is not qualified to provide expert opinion testimony about the process and timeline for developing a multicancer screening test because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)). Dr. Cote is also not a credible witness. (*See* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects)). In addition to being unqualified and not credible, Dr. Cote's opinions

about the process and timeline for developing a multicancer screening test is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

This proposed finding improperly cites expert testimony. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as a source of underlying facts of which he has no personal knowledge, in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

530. [redacted]

Response to Finding No. 530

[redacted]

[redacted]

[redacted]

a. Singlera's PanSeer Test

531. Singlera's PanSeer test is a pipeline NGS-based cfDNA methylation RUO cancer screening test that uses Singlera's cell-free methylated DNA immunoprecipitation sequencing ("cfMeDIP-seq") method that is capable of methylome analysis of small quantities (1–10 ng) of cfDNA to provide broad insight into genome-wide DNA methylation patterns of cfDNA without the increased costs associated with whole-genome sequencing. (*See* RX3628 (Shen et al., 2019).)

Response to Finding No. 531

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted verbatim from Dr. Cote's report (RX3869 (Cote Report) ¶ 239), even though Respondents do not attribute it to Dr. Cote, and represents his opinion rather than market realities.

The proposed finding is vague because the terms "pipeline," "RUO," "immunoprecipitation," and "increased costs" are undefined.

The proposed finding is unsupported because the evidence cited does not mention Singlera or PanSeer.

The proposed finding is misleading to the extent its characterization of Singlera's PanSEER test as "pipeline" and "RUO" suggests that Singlera is not making substantial progress commercializing its test. The proposed finding is against the weight of the evidence showing that [redacted]

This proposed finding improperly cites expert testimony. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as a source of underlying facts of which he has no personal knowledge, in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

532. PanSeer examines about 10,613 to over 20,000 methylation markers in cfDNA for the detection of five (5) cancer types – colorectal, esophageal, liver, lung, and stomach. (RX3115 (Chen et al., 2020) at 3; RX3637 (Singlera) at 1–8; Gao (Singlera) Tr. 2874–75.)

Response to Finding No. 532

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted verbatim from Dr. Cote's report (RX3869 (Cote Report) ¶ 239), even though Respondents do not attribute it to Dr. Cote, and represents his opinion rather than market realities.

Complaint Counsel objects to the attribution of RX3637 (which Respondents appear to have captured from Singlera's website) to Singlera as the source of the document (Singlera did not produce the document), in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3. The document constitutes hearsay, and given the inherent unreliable nature of this document, it has little to no probative value. (*See* Rule 4.43(b)).

The proposed finding is vague in its use of "10,613 to over 20,000 methylation markers" as it does not explain the basis or context for this claim or describe these methylation markers in any way.

This Court should disregard this evidence.

533. The PanSeer test only requires approximately 2 million sequencing reads per sample, and is compatible with both Illumina's MiSeq or NextSeq systems and Thermo Fisher's Ion Torrent S5 systems, though it appears to primarily use the NextSeq 550Dx system from Illumina. (RX3115 (Chen et al., 2020) at 7; RX3637 (Singlera) at 1–6; Gao (Singlera) Tr. 2875, 2894, 2928–29; PX7102 (Gao (Singlera) Dep. at 78); RX3869 (Cote Expert Report) ¶ 239.)

Response to Finding No. 533

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted verbatim from Dr. Cote's report and represents his opinion rather than market realities.

The proposed finding is vague because it does not define "compatible." The proposed

finding is misleading because it says the PanSeer test is compatible with Thermo Fisher's Ion Torrent S5 system but appears to "primarily" use the Illumina NextSeq 550Dx. In fact, although the PanSeer test may in theory be "compatible" with the Thermo Fisher Ion Torrent S5 instrument, that does not mean that the Thermo instrument has the cost, accuracy, and throughput necessary to support developing and commercializing Singlera's PanSeer MCED test; moreover, none of the evidence cited in the proposed finding establishes that the PanSeer test has ever actually been run the Thermo Fisher Ion Torrent S5 system even a single time.

The proposed finding is misleading because it claims that the PanSeer test only requires approximately 2 million sequencing reads per sample. The source Respondents cite for this claim—RX3115—is a paper that was submitted in March 2020 concerning a research study conducted prior to that date. Importantly, RX3115 describes only the version of Singlera's PanSeer test that was used in that now several-year-old study. More recent evidence shows that the PanSeer test requires a higher number of reads per patient sample. As Dr. Gao testified, the PanSeer test as of the date of his deposition (June 2, 2021) requires "a few million to 10 million [reads] for each individual," yielding between "50 to a hundred" patient samples). (PX7102 (Gao (Singlera) Dep. at 78-79). Indeed one hundred patient samples times ten million reads per sample yields 400 million reads, which is the specification for the number of reads that can be generated in one run of the Illumina NextSeq Dx that PanSeer uses for its test. (PX0114 (Illumina) at 2 (Sequencing Platforms, https://www.illumina.com/systems/sequencing-platforms.html (last visited Apr. 6, 2022)). Moreover, Dr. Gao testified that those numbers apply to the colorectal cancer version of the PanSeer test. (PX7102 (Gao (Singlera) Dep. at 78). Importantly, Dr. Gao testified that the pan-cancer version of the PanSeer test "could be less" patient samples per run—"between 20 to 50." (PX7102 (Gao (Singlera) Dep. at 78-79).

Accordingly, any suggestion that the current pan-cancer version of Singlera's PanSeer test in development requires only 2 million reads per patient sample is misleading and against the weight of recent evidence demonstrating that the number is much higher. The Court should disregard the proposed finding.

Dr. Cote is not qualified to provide expert opinion testimony about which NGS platforms are viable for MCED testing, because he has never operated an NGS instrument and has no publications related to NGS, among other reasons. (*See* Response to RPFF ¶ 1964, below (examining Dr. Cote's lack of qualifications on subject of which NGS platforms are viable for MCED testing)). Dr. Cote is also not a credible witness. (*See* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects)). In addition to being unqualified and not credible, Dr. Cote's opinions about which NGS platforms are viable for MCED testing is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

534. In a retrospective, observational study of 418 participants from part of the Taizhou Longitudinal Study with samples from 113 post-diagnosis cancer patients, 98 pre-diagnostic cancer patients, and 207 healthy individuals, PanSeer achieved a 96.1% specificity, 87.6% sensitivity in post-diagnostic cancer patients, and 94.9% sensitivity in 98 pre-diagnostic cancer patients. (RX3637 (Singlera) at 1–6; Gao (Singlera) Tr. 2877–79.) Singlera envisions, however, that any patient testing positive on PanSeer would then undergo additional blood test and/or follow-up imaging to allow tissue of origin mapping. (RX3869 (Cote Expert Report) ¶ 239; RX3115 (Chen et al., 2020) at 6.)

Response to Finding No. 534

The proposed finding, which consists of language copied and pasted from Dr. Cote's expert report, is misleading, confusing, and mischaracterizes cited evidence.

The first sentence of the proposed finding is not supported by the citations listed by

Respondents. Neither RX3637 nor the trial testimony of Dr. Gao provides or lists the specific numbers Respondents reference in the proposed finding. It is unclear from where Respondents are drawing these numbers. To the extent Respondents attribute them to the cited sources, Respondents mischaracterize those sources. As written and cited, the first sentence is unsupported and unreliable. The court should disregard the proposed finding.

The second sentence of the proposed finding purports to provide a factual account about what "Singlera envisions." The primary source cited for the proposed finding is the expert report of Dr. Cote. This Court ordered, however, that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote to support factual propositions in contravention of this Court's Order. The Court should disregard this evidence.

The only other cite for the second sentence of the proposed finding is a citation to RX3115 (Chen et al., Non-invasive Early Detection of Cancer Four Years Before Conventional Diagnosis Using a Blood Test, Nature, 2020)). RX3115 is an academic paper. The authors do not purport to be speaking for Singlera as a corporate entity. It is not sensible to cite the article as evidence of what "Singlera," as a corporate entity, envisions. (The lead author, for example, lists several affiliations with various innovation centers and institutes of health, but does not list any specific business affiliation with Singlera itself.)

The proposed finding is confusing because its (Dr. Cote's) use of the term "however" does not make grammatical sense. Even if the two sentences in the finding were properly supported (which they are not), nothing in the proposed language of the second sentence would in any way contradict or counter any of the proposed language in the first sentence of the first finding.

Finally, the proposed finding is misleading to the extent it suggests that patients who test positive on Galleri would not need to "undergo additional blood test and/or follow-up imaging." Aa positive Galleri result "requires confirmatory diagnostic evaluation by medically established procedures (e.g. imaging) to confirm cancer," notwithstanding Galleri's "cancer signal of origin" feature. (PX0063 at 002 (Grail, https://grail.com/galleri/, accessed on Apr. 29, 2021). Indeed, Grail's CEO, Hans Bishop, admitted at trial that certain patients may have to undergo a body scan following a positive Galleri test to identify the cancer tissue of origin. (Bishop (Grail) Tr. 1387.)

Interim results from PATHFINDER, an actual interventional trial for Galleri, indicate that additional imaging testing was required for positive results 90 percent of the time. (RX3041 at 001 (Tomasz M. Beer, Interim Results of PATHFINDER, a Clinical Use Study Using a Methylation-Based Multi-Cancer Early Detection Test, 2021 ASCO Annual Meeting Presentation, June 4, 2021) ("Most participants with diagnostic resolution had at least 1 imaging test (57/63; 90%).").

The Court should disregard the proposed finding.

534.1 [redacted] In fact, only a very small portion of the samples from 100,000 participants of the Taizhou Longitudinal Study were used. (RX3115 (Chen et al., 2020) at 3; RX3869 (Cote Expert Report) n. 38.)

Response to Finding No. 534.1

[redacted]

[redacted]

535. [redacted] No analytical or clinical data that Singlera has collected provides support for the proposition that PanSeer can detect more than 5 cancer types, let alone 50 or 150 cancer types. (Gao (Singlera) Tr. 2917–18; RX3869 (Cote Expert Report) ¶ 241; [redacted]

Response to Finding No. 535

[redacted]

[redacted]

536. [redacted]
However, Singlera's subsequent deposition testimony suggests that such a timeline does not appear to be feasible. (Gao (Singlera) Tr. 2925–27, 2942–43, 2949; PX7102 (Gao (Singlera) Dep. at 81–85).)

Response to Finding No. 536

[redacted]

[redacted]

536.1 In particular, Singlera testified that it is "far away" from starting clinical trials for PanSeer in the United States, and that it is "still not in the really starting clinical trial state." (Gao (Singlera) Tr. 2926; PX7102 (Gao (Singlera) Dep. at 113–14, 81–82.) For a pan-cancer trial, Singlera estimates that a clinical trial would need to be for 100,000 or 200,000 people, somewhere around eight or 10 years. (Gao (Singlera) Tr. 2925–26; PX7102 (Gao (Singlera) Dep. at 122–23).).

Response to Finding No. 536.1

[redacted]

The proposed finding is misleading [redacted]

[redacted] The proposed finding is against the weight of the evidence showing that [redacted]

[redacted]

536.2 Therefore, by Dr. Gao's own calculation, PanSeer is at least eight to ten years away from potential launch in the United States. (Gao (Singlera) Tr. 2925–26; RX3869 (Cote Expert Report) ¶ 242.)

Response to Finding No. 536.2

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted verbatim from Dr. Cote's report, and represents his opinion rather than market realities.

The proposed finding is misleading to the extent its characterization of Singlera's PanSEER test as "pipeline" and "RUO" suggests that Singlera is not making substantial progress commercializing its test. The proposed finding is against the weight of the evidence showing that [redacted]

Dr. Cote is not qualified to provide expert opinion testimony about the process and timeline for developing a multicancer screening test because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)). Dr. Cote is also not a credible witness. (*See* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems

across these subjects)). In addition to being unqualified and not credible, Dr. Cote's opinions about the process and timeline for developing a multicancer screening test is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

This proposed finding improperly cites expert testimony. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as a source of underlying facts of which he has no personal knowledge, in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

> 536.3 Singlera does not currently have any clinical trials relating to screening for multiple cancers listed on clinicaltrials.gov. (RX3869 (Cote Expert Report) ¶ 242.); Gao (Singlera) Tr. 2926; Cote Tr. 3869.)

Response to Finding No. 536.3

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted verbatim from Dr. Cote's report, and represents his opinion rather than market realities.

The proposed finding is misleading to the extent its characterization of Singlera's PanSEER test as "pipeline" and "RUO" suggests that Singlera is not making substantial progress commercializing its test. The proposed finding is against the weight of the evidence showing that [redacted]

[redacted]

Dr. Cote is not qualified to provide expert opinion testimony about the process and timeline for developing a multicancer screening test because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)). Dr. Cote is also not a credible witness. (*See* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects)). In addition to being unqualified and not credible, Dr. Cote's opinions about the process and timeline for developing a multicancer screening test is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

This proposed finding improperly cites expert testimony. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as a source of underlying facts of which he has no personal knowledge, in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

b. Singlera's ColonES® Tests

537. In addition to the PanSeer cancer screening test in development, Singlera is also developing single cancer screening tests for colorectal cancer and likely lung cancer. (Gao (Singlera) Tr. 2872–73; RX3869 (Cote Expert Report) ¶ 243.)

Response to Finding No. 537

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted verbatim from Dr. Cote's report, and

represents his opinion rather than market realities.

The proposed finding is unsupported because the testimony cited does not mention a screening test for lung cancer.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as support for a purported underlying fact—that Singlera is developing a single cancer test for "likely lung cancer"—in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

538. The ColonES® rapid colon cancer assay is a targeted bisulfite NGS sequencing test of ctDNA methylation signatures from blood plasma. (Gao (Singlera) Tr. 2873–74; RX3869 (Cote Expert Report) ¶ 244.)

Response to Finding No. 538

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted verbatim from Dr. Cote's report, and represents his opinion rather than market realities.

The proposed finding is unsupported because the testimony cited does not state or support that ColonES uses "targeted bisulfite NGS sequencing" or "blood plasma" samples. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as a source of underlying facts for which he has no personal knowledge, in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

539. Singlera reported that it had an initial Pre-Submission Meeting with the FDA regarding its ColonES® test in the fall of 2019, and a second Pre-Submission Meeting on April

21, 2020, and that Singlera planned to start the ColonES® pivotal study in the United States in the second half of 2020. (RX3635 (Singlera) at 1–2.)

Response to Finding No. 539

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted verbatim from Dr. Cote's report (RX3869 (Cote Report) ¶ 244), even though Respondents do not attribute it to Dr. Cote, and represents his opinion rather than market realities.

Complaint Counsel objects to the attribution of RX3635 to Singlera. RX3635 appears to be a document about a Singlera press release that Respondents captured from an unknown source, as it contains no URL. The document was not produced by Singlera. This document constitutes unreliable hearsay, and given the inherent unreliable nature of this document, it has little to no probative value. (*See* Rule 4.43(b)). This Court should disregard this evidence and the proposed finding.

540. In 2018, Singlera reported the results of its ColonES retrospective study to screen for early stage colorectal cancer and precancerous advanced adenomas. (RX3869 (Cote Expert Report) ¶ 244.)

Response to Finding No. 540

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted verbatim from Dr. Cote's report, and represents his opinion rather than market realities.

The proposed finding improperly cites expert testimony. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only source for the purported fact about Singlera reporting its study results, in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

540.1 In this 1,243 participant study with 291 Stage I colorectal cancer patients, 133 Stage II patients, 124 Stage III patients, and 102 Stage IV patients, 204 advanced adenomas patients and 429 healthy individuals, the ColonES® test achieved sensitivities of 93% for colorectal cancer and 88% for advanced adenoma with a specificity of 99%. (RX3636 (Singlera) at 1–2; RX3273 (Gole et al., 2018); RX3869 (Cote Expert Report) ¶ 244.)

Response to Finding No. 540.1

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted verbatim from Dr. Cote's report, and represents his opinion rather than market realities.

The proposed finding improperly cites expert testimony. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as a source for purported facts about Singlera's study, in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

541. Singlera has also conducted a prospective, observational study in China of 300 participants for the detection of early-stage lung cancer. (RX3130 (Clinicaltrials.gov) at 1–5.) Singlera has not reported results of this study yet. (RX3869 (Cote Expert Report) ¶ 245.)

Response to Finding No. 541

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted verbatim from Dr. Cote's report, and represents his opinion rather than market realities.

This proposed finding is improper expert opinion. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as a source for purported facts about Singlera's study, in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

542. Despite these efforts with clinical trials in China, Singlera believes that it is "far from" starting FDA clinical trials for ColonES in the United States. (PX7102 (Gao (Singlera) Dep. at 113).) Singlera testified that it will need a three to four year study for at least 10,000 people for the trial. (PX7102 (Gao (Singlera) Dep. at 120–21); Gao (Singlera) Tr. 2923.) In addition, Singlera is considering a qPCR version—not NGS—of the ColonES test to be launched in China first. (PX7042 (Gao (Singlera) IHT at 90–91); Gao (Singlera) Tr. 2911–12.) Therefore, by its own admission, Singlera appears to anywhere from three to seven years away from completing clinical trials for ColonES, and likely even longer. (RX3869 (Cote Expert Report) ¶ 246; Gao (Singlera) Tr. 2923.)

Response to Finding No. 542

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted verbatim from Dr. Cote's report, and represents his opinion rather than market realities.

The proposed finding is misleading to the extent it suggests Singlera is years away from starting FDA clinical trials for ColonES in the United States, because Dr. Gao testified that by "far" away he means one year. (Gao (Singlera) Tr. 2921) ("Well, I already told you. My 'far' is one year.")).

The proposed finding is vague because it is not clear what "these efforts with clinical trials in China" references. The proposed finding is also vague because it does not define "likely even longer."

The proposed finding is unsupported because the testimony cited to support the misleading and conclusory claim that "Singlera appears to be anywhere from three to seven years away from completing clinical trials for ColonES, and likely even longer" simply provides no support for the point. (Gao (Singlera) Tr. 2923).

The only other evidence cited for this purported point is Dr. Cote's report, which is improper expert testimony. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote in contravention of this Court's Order. This

Court should disregard this evidence.

The proposed finding is misleading to the extent it suggests that qPCR-based detection systems are a viable platform for MCED testing. The proposed finding is against the weight of significant evidence demonstrating that PCR-based detection platforms (such as qPCR and dPCR) cannot be used for MCED testing. (*See* CCFF ¶¶ 1441-93). Therefore, this Court should disregard the proposed finding.

C. Non-NGS Cancer Screening Developers

1. StageZero

543. StageZero Life Sciences ("StageZero"), formerly known as Genenews, is a molecular diagnostics company based in Richmond Hill, Canada and Richmond, Virginia. (PX8542 (StageZero) at 1.)

Response to Finding No. 543

[redacted]

544. [redacted]

Response to Finding No. 544

[redacted]

[redacted]

545. StageZero was founded in 2000, and began working on its colorectal cancer screening test (called ColonSentry) in 2003. (PX7114 (Stamatiou (StageZero) Dep. at 10–11, 25).) [redacted]

Response to Finding No. 545

[redacted]

546. StageZero intends to provide, on a limited basis to a network of oncologists, a microarray-based cancer screening LDT test, together with partners Health Clinics and Care Oncology, called Aristotle. (RX3659 (StageZero) at 1.)

Response to Finding No. 546

[redacted]

[redacted]

547. Aristotle is a microarray-based blood biopsy test that interrogates mRNA from whole blood (blood transcriptome) to detect gene expression profiles indicative of 10 discrete cancers. (RX3171 (Dempsey et al., 2020) at 1–2.)

Response to Finding No. 547

[redacted]

[redacted]

548. Aristotle will detect 9 cancers relevant for women (the "female" test): ovarian, breast, cervical, endometrial, colorectal, bladder, stomach, liver and nasopharyngeal, and 6 cancers for men (the "male" test): prostate, colorectal, bladder, stomach, liver and nasopharyngeal. (RX3653 (StageZero) at 4; [redacted] RX3869 (Cote Expert Report) ¶ 248.)

Response to Finding No. 548

[redacted]

549. In contrast to the DNA methylation or genomic mutation based approaches used by GRAIL, Thrive, and other companies, StageZero uses an approach called immunoediting, under the theory that when normal cells transform into clinically-detectable cancer, the human immune system protects the human body from cancer and forces the developing tumors to undergo immunogenic "sculpting" through three phases: elimination, equilibrium and escape. (RX3643 (Smyth et al., 2006) at 1–50.)

Response to Finding No. 549

The proposed finding relies on unreliable hearsay evidence and is misleading and vague. The sole citation to this proposed finding is to a sixteen-year-old journal article. Respondents are

using out of Court statements contained in this article to describe the science of StageZero's approach. As this is being presented for the truth of the matter contained, it is unreliable hearsay evidence. The overall reliability of this article is questionable, at best. A sixteen-year-old journal article is hardly reliable evidence to describe StageZero's current scientific approach. Furthermore, although Respondents proposed finding mentions StageZero's approach in comparison to Grail, Thrive and unidentified "other companies," the article itself offers no comparison—not surprising as it is sixteen years old. It is impossible therefore to assess how meaningful it is that StageZero uses "immunoediting" without more description of how StageZero compares to these others. For this reason, this proposed finding is vague and confusing. This proposed finding is also vague because the terms "immunoediting" and "immunogenic 'sculpting'" are undefined.

Respondents' citation to RX3643 is in contravention of this Court's Order regarding post-trial findings. This Court ordered that "[w]hen citing to exhibits, the parties shall identify the document by the PX or RX number, followed by the name of the entity that produced the document, and the page number." (Order on Post-Trial Findings at 3). RX3454 is a 50-page document, so Respondents' citation to pages 1-50 comprises the entire document. Thus, Respondents fail to provide a citation to specific page number or page range in contravention of the Court's Order. The Court should disregard this proposed evidence.

The proposed finding is misleading because Respondents fail to identify Dr. Cote's report as the source from which the entire finding was copied and pasted verbatim. (RX3869 (Cote Report) ¶ 249). Therefore, the Court should disregard the proposed finding.

> 549.1 As a result of this immunoediting, gene expressions in the transforming cancer cells, *i.e.*, the mRNA from the transcriptome, display signature profiles, and cause a corresponding change in the mRNA profiles in the peripheral blood plasma. (RX3869 (Cote Expert Report) ¶ 249.)

Response to Finding No. 549.1

The proposed finding is improper, unreliable, and vague. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report to support this proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 249; *see* Order on Post-Trial Findings at 3). And, moreover, the quoted portion of Dr. Cote's report—i.e., the entire proposed finding—does not contain any factual citation at all, as it originally appeared in Dr. Cote's report. (RX3869 (Cote Report) ¶ 249). Respondents improperly rely on Dr. Cote's expert opinions to support this proposed finding, in contravention of this Court's Order, and otherwise have never provided any evidence to support this proposed finding, either here or in Dr. Cote's report, and therefore this Court should disregard Respondents' proposed finding.

Dr. Cote is not qualified to provide expert opinion testimony about StageZero's process for developing a multicancer screening test because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)). Furthermore, Dr. Cote is not a credible witness. Dr. Cote offered opinion testimony in this matter that spans multiple disparate subjects and exceeds his expertise, and his trial testimony also contained unsupported claims about his experience related to MCED test development that exceed the information disclosed in his report in violation of this Court's order. (*See* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects)). Because Dr. Cote is unqualified and not credible, his opinion does not deserve any weight.

The proposed finding is vague because the terms "immunoediting," "transcriptome," "signature profiles," and "peripheral blood plasma" are undefined. Therefore, the Court should disregard the proposed finding.

549.2 StageZero's Aristotle detects this change using Thermo Fisher/Affymetrix's GeneChipTM Gene Expression Profile microarray—not NGS—which tests more than 36,000 gene transcripts and variants. (RX3171 (Dempsey et al., 2020) at 1–2.)

Response to Finding No. 549.2

[redacted]

[redacted]

550. In a 2,845 unique blood samples validation study with 1,013 samples from patients diagnosed with 10 cancers and 1,832 control samples including 1,042 samples from healthy subjects and the remaining from patients diagnosed with non-cancer diseases, Aristotle achieves sensitivity from 55.6% to 100% for various cancers at 99.0% specificity, with PPVs from 5.6–77.7% and mean false positive rate ranging from 0.3% to 6.8%. (RX3171 (Dempsey et al., 2020) at 1–2.)

Response to Finding No. 550

The proposed finding is misleading and vague. The proposed finding is misleading because Respondents fail to identify Dr. Cote's report as the source from which the entire finding was copied and pasted verbatim. (RX3869 (Cote Report) ¶ 249). The proposed finding is vague because the term "10 cancers" is ambiguous. It is unclear whether the 10 cancers referenced in the proposed finding align with the cancers that StageZero claims Aristotle can detect. Therefore, the Court should disregard the proposed finding.

551. StageZero states that the Aristotle test can fully discriminate each cancer, but has not fully disclosed how the tissue of the origin of the cancers are determined. (RX3653 (StageZero) at 1–4.) [redacted]

Response to Finding No. 551

[redacted]

[redacted]

552. [redacted] StageZero currently does not have any multi-cancer clinical trial listed on clinicaltrials.gov. (RX3869 (Cote Expert Report) ¶ 251.)

Response to Finding No. 552

[redacted]

2. **Genesys Biolabs**

553. Genesys Biolabs, a business unit of 20/20 GeneSystems, Inc., is a molecular diagnostics company based in Rockville, Maryland. (RX3869 (Cote Expert Report) ¶ 252.) Genesys Biolabs currently provides a cancer screening test for lung, liver, pancreas, ovaries, kidneys, prostate and colon cancers. (RX3869 (Cote Expert Report) ¶ 252.)

Response to Finding No. 553

The proposed finding is improper and vague. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be

established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report to support this proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 252; *see* Order on Post-Trial Findings at 3). And, moreover, the quoted portion of Dr. Cote's report—i.e., the entire proposed finding—does not contain any factual citation at all, as it originally appeared in Dr. Cote's report. (RX3869 (Cote Report) ¶ 252). Respondents improperly rely on Dr. Cote's expert opinions to support this proposed finding, in contravention of this Court's Order, and otherwise have never provided any evidence to support this proposed finding, either here or in Dr. Cote's report, and therefore this Court should disregard Respondents' proposed finding.

The proposed finding is vague because the term "business unit" is ambiguous and undefined.

554. Genesys Biolabs currently provides a proteomics-based LDT blood test, called OneTestTM. (RX3259 (Genesys Biolabs) at 1.) OneTest measures a panel of seven widely used cancer protein biomarkers (AFP, CEA, PSA, CA 19–9, CA 125, CA 15–3, and CYFRA 21–1)—not NGS—from a single blood biopsy sample, to simultaneously screens for cancers from the lung, liver, pancreas, ovaries, kidneys, prostate and colon using immunoassay on the Roche Cobas e411 immunoassay analyzer. (RX3259 (Genesys Biolabs) at 1.)

Response to Finding No. 554

The proposed finding is unsupported, unreliable hearsay evidence, misleading, and vague. Complaint Counsel objects to the attribution of RX3259 which Respondents purportedly captured from OneTestForCaner's website to Genesys Biolabs as the source of the document, in contravention of this Court's Order. (*See* Order on Post-Trial Findings at 3.) The document was not produced by Genesys Biolabs. Respondents elected not to pursue any form of discovery from Genesys Biolabs in this action. The document itself constitutes unreliable hearsay. It is an untested statement, not produced by Genesys Biolabs, which Respondents offer for the truth and

attribute to a party that did not testify in this proceeding. Given the inherent unreliable nature of the document, it lacks probative value (*see* Rule 4.43(b)). This court should disregard RX3259.

The proposed finding is unsupported because RX3259 does not identify OneTest as a proteomics-based LDT test and does specify that OneTest uses immunoassay on the Roche Cobas e411 immunoassay analyzer. (RX3259 at 1 (One Test for Cancer: Why Get Tested, https://onetestforcancer.com/learn)).

The proposed finding is misleading because Respondents fail to identify Dr. Cote's report as the source from which the entire finding was copied and pasted verbatim. (RX3869 (Cote Report) ¶ 253).

The proposed finding is vague because the terms "immunoassay" and "Roche Cobas e411 immunoassay analyzer" are undefined. Therefore, the Court should disregard the proposed finding.

555. In a prospective observational study of 41,516 participants taking health check-up examination at the Chang Gung Memorial Hospital in Taoyuan, Taiwan between May 2001 and April 2013, the OneTest panel of protein biomarkers, together with squamous cell-specific antigen, a biomarker associated with head and neck cancer not common in the U.S., achieved 57% sensitivity at 88.7% specificity, with PPV of 3.7%, and NPV of 99.6%. (RX3739 (Wen et al., 2015) at 2.)

Response to Finding No. 555

The proposed finding is misleading, vague, and relies on unreliable hearsay evidence. The proposed finding is misleading to the extent that it suggests the Chang Gung Memorial Hospital study only measured OneTest's ability to detect head and neck cancer. As outlined in the Wen et al. article (RX3739), the Chang Gung Memorial Hospital study measured OneTest's ability to detected 18 different cancers, which the test did with varying degrees of specificity and sensitivity. (RX3739 at 002 (Wen et al., Cancer Screening through a Multi-Analyte Serum Biomarker Panel During Health Check-Up Examinations, *Clinica Chimica Acta* 450 (2015); *see*

also RPFF ¶ 555.1). Thus, the statistics for head and neck cancer should be taken as representative of the entire study. The proposed finding is also misleading because Respondents fail to identify Dr. Cote's report as the source from which the entire finding was copied and pasted verbatim. (RX3869 (Cote Report) ¶ 253).

This proposed finding also contains unreliable hearsay evidence. This is a journal article being used to represent the capabilities of OneTestPanel, not a document was produced by Genesys Biolabs, the purported owner of OneTestPanel. Respondents elected not to pursue any form of discovery from Genesys Biolabs in this action. The document itself constitutes unreliable hearsay. It is an untested statement, not produced by Genesys Biolabs, which Respondents offer for the truth. This journal article is six years old and therefore is not a reliable source for the current capabilities of the OneTestPanel.

The proposed finding is vague because the term "squamous" is undefined. Therefore, the Court should disregard the proposed finding.

> 555.1 The panel's sensitivity for liver, lung, prostate, and colorectal cancers was 90.9%, 75.0%, 100%, and 76.9%, respectively, but the panel had a poor sensitivity for identifying head and neck cancer (17.6%), breast cancer (37.5%), and cervical cancer (44.4%). (RX3739 (Wen et al., 2015) at 2.)

Response to Finding No. 555.1

The proposed finding is incomplete, contains unreliable hearsay evidence, misleading, and vague. The proposed finding is incomplete because it does not include the fact that liver, lung, prostate, and colorectal cancers are the most four commonly diagnosed cancers. RX3739 repeatedly mentions this fact when listing the high rate of sensitivity for liver, lung, prostate, and colorectal cancers. (RX3739 at 001, 002 (Wen et al., Cancer Screening through a Multi-Analyte Serum Biomarker Panel During Health Check-Up Examinations, *Clinica Chimica Acta* 450 (2015)).

The proposed finding is also misleading because Respondents fail to identify Dr. Cote's report as the source from which the entire finding was copied and pasted verbatim. (RX3869 (Cote Report) ¶ 253).

This proposed finding also contains unreliable hearsay evidence. This is a journal article being used to represent the capabilities of OneTestPanel, not a document was produced by Genesys Biolabs, the purported owner of OneTestPanel. Respondents elected not to pursue any form of discovery from Genesys Biolabs in this action. The document itself constitutes unreliable hearsay. It is an untested statement, not produced by Genesys Biolabs, which Respondents offer for the truth. This journal article is six years old and therefore is not a reliable source for the current capabilities of the OneTestPanel.

The proposed finding is vague because the term "the panel" is ambiguous. Therefore, the Court should disregard the proposed finding.

556. Genesys Biolabs currently does not have any clinical trials relating to screening for multiple cancers listed on clinicaltrials.gov. (RX3869 (Cote Expert Report) ¶ 254.)

Response to Finding No. 556

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report to support this proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 254; *see* Order on Post-Trial Findings at 3). And, moreover, the quoted portion of Dr. Cote's report—i.e., the entire proposed finding—does not contain any factual citation at all, as it originally appeared in Dr. Cote's report. (RX3869 (Cote Report) ¶ 254). Respondents improperly rely on Dr. Cote's expert opinions to support this proposed finding, in contravention of this Court's Order, and

otherwise have never provided any evidence to support this proposed finding, either here or in Dr. Cote's report, and therefore this Court should disregard Respondents' proposed finding.

3. InterVenn Biosciences

557. InterVenn Biosciences ("InterVenn") is a biotechnology company based in South San Francisco, California. (RX3388 (InterVenn) at 1.) InterVenn is known to be developing early cancer detection tests for advanced adenoma, colorectal cancer and nasopharyngeal carcinoma. (Leite (Illumina/InterVenn) Tr. 2171–74.) InterVenn is also developing a population diagnostic test for ovarian cancer; a therapy selection test for pancreatic cancer, lung cancer and melanoma, called Dawn; and a renal cell carcinoma test. (Leite (Illumina/InterVenn) Tr. 2170, 2172, 2180; *see also* RX3869 (Cote Expert Report) ¶ 255.)

Response to Finding No. 557

The proposed finding is vague because the terms "advanced adenoma," "nasopharyngeal carcinoma," "population diagnostic test," and "renal cell carcinoma" are undefined. This proposed finding is also misleading to the extent it is implying that InterVenn has an MCED test in development. The testimony from Mr. Leite and the InverVenn document Respondents cite indicate that InterVenn is developing multiple single cancer tests for use at different stages of cancer diagnoses and treatment. [redacted] Therefore, the Court should disregard the proposed finding.

a. InterVenn's VISTA™ proteomics platform

558. InterVenn currently provides an AI-enabled, mass spectrometry glycoproteomics based proteomics platform—not NGS—called VISTA. (RX3389 (InterVenn) at 1.) VISTA is a scalable platform to assess glycoprotein post-translational modifications in a site-specific manner across thousands of peptides and glycopeptides. (RX3869 (Cote Expert Report) ¶ 256.) It can quantify thousands of glycoproteoforms in a single measurement using only 10 microliters of serum/plasma. (RX3389 (InterVenn) at 1.)

Response to Finding No. 558

The proposed finding is improper, vague, and misleading. The proposed finding is

improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report to support the second sentence of the proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 256; *see* Order on Post-Trial Findings at 3). And, moreover, this portion of Dr. Cote's report—i.e., the second sentence of the finding—does not contain any factual citation at all, as it originally appeared in Dr. Cote's report. (RX3869 (Cote Report) ¶ 256). Respondents improperly rely on Dr. Cote's expert opinions to support this proposed finding, in contravention of this Court's Order, and therefore this Court should disregard the second sentence of Respondents' proposed finding.

The proposed finding is vague because the terms "proteomics," "glycoproteomics," "mass spectrometry," "post-translational," "peptides," "glycopeptides," and "glycoproteoforms" are undefined.

The proposed finding is also misleading and contrary to the weight of the evidence to the extent that respondents are implying that the InterVenn proteomics platform is somehow a substitute for NGS systems for multi-cancer screening. [redacted] Indeed, as noted in Complaint Counsel's response to Respondents Proposed finding No. 558 above, InterVenn appears to be developing single cancer tests and not MCED tests on its proteomics platform. Therefore, the Court should disregard the proposed finding.

559. The VISTA platform can be used to identify new cancer biomarkers. (RX3869 (Cote Expert Report) ¶ 256.) For example, using multienzyme digestion and glycopeptide enrichment, InterVenn simultaneously monitored the abundances of over 600 glycopeptides,

showing its potential for clinical deployment in the fields of cancer. (RX3424 (Li et al., 2019) at 1.)

Response to Finding No. 559

The proposed finding is improper, vague, and contains unreliable hearsay evidence, and should be disregarded as unsupported. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report to support the first sentence of the proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 256; *see* Order on Post-Trial Findings at 3). And, moreover, this portion of Dr. Cote's report—i.e., the first sentence of the finding—does not contain any factual citation at all, as it originally appeared in Dr. Cote's report. (RX3869 (Cote Report) ¶ 256). Respondents improperly rely on Dr. Cote's expert opinions to support this proposed finding, in contravention of this Court's Order, and therefore this Court should disregard the first sentence of Respondents' proposed finding.

This proposed finding also contains unreliable hearsay evidence. Respondents cite a three-year-old journal article to represent the capabilities of InterVenn, not a document was produced by InterVenn. The document itself constitutes unreliable hearsay. It is an untested statement, not produced by InterVenn, which Respondents offer for the truth. Nowhere in this journal article (RX3424) is it apparent that the results being discussed relate to InterVenn's current product. As such, it is not reliable evidence for InterVenn's capabilities or purported applications. Because this proposed finding improperly relies on an expert report for a factual proposition and unreliable hearsay evidence, this Court should disregard it as unsupported.

The proposed finding is also vague because the terms "multienzyme digestion,"

"glycopeptide enrichment," and "glycopeptides" are undefined, while the term "fields of cancer" is ambiguous. Additionally, the proposed finding does not specify which new cancer biomarkers the VISTA platform can identify. Therefore, the Court should disregard the proposed finding.

560. InterVenn has used VISTA to conduct oncology research in over a dozen different cancers, including ovarian, renal, lung, liver, prostate, pancreas, nasopharyngeal, and colorectal cancer and several others. (RX3388 (InterVenn) at 2.)

Response to Finding No. 560

The proposed finding is misleading and vague. The proposed finding is misleading because Respondents fail to identify Dr. Cote's report as the source from which the entire finding was copied and pasted verbatim. (RX3869 (Cote Report) ¶ 256). The proposed finding is vague because the terms "oncology research" and "several others" are ambiguous. Therefore, the Court should disregard the proposed finding.

561. In November 2020, InterVenn announced that its VISTA panel has demonstrated multi-indication performance in early cancer detection for different cancers with sensitivities and specificities consistently above 90 and as high as 98%. (RX3087 (BusinessWire) at 1; RX3869 (Cote Expert Report) ¶ 56.)

Response to Finding No. 561

The proposed finding is vague because the terms "multi-indication performance" and "different cancers" are ambiguous. Respondents do not specify how many cancers or which cancers the VISTA panel has demonstrated an ability to detect. Moreover, this proposed finding is misleading to the extent it implies that InterVenn is developing an MCED test. The Business Wire article Respondents cite makes clear that InterVenn is developing a series of single cancer tests that "can be deployed in a highly targeted fashion in individuals at high risk for a particular disease." (RX3087 (Business Wire) at 2 (InterVenn Biosciences Reports Results on Vista, Nov. 10, 2020)). Therefore, the Court should disregard the proposed finding.

b. InterVenn's Dawn™ Immuno-Oncology test

562. InterVenn currently provides a glycoproteomics-based clinical diagnostic test called Dawn™ to help physicians make the best possible choice for patient outcomes when deploying immuno-oncology therapies. (RX3387 (InterVenn) at 1.)

Response to Finding No. 562

The proposed finding is misleading and vague. The proposed finding is misleading because Respondents fail to identify Dr. Cote's report as the source from which the entire finding was copied and pasted verbatim. (RX3869 (Cote Report) ¶ 257). The proposed finding is vague because the terms "glycoproteomics" and "immuno-oncology" are undefined. Therefore, the Court should disregard the proposed finding.

563. InterVenn currently has data to support Dawn™ in pancreatic cancer, lung cancer, melanoma, and are working on other cancers. (RX3387 (InterVenn) at 2.)

Response to Finding No. 563

The proposed finding is misleading and vague. The proposed finding is misleading because it is not clear what the data shows Dawn can do in pancreatic cancer, lung cancer, and melanoma. For instance, it is not clear if the Dawn test is used to detect these cancers, to identify the best treatment option, or perform some other task associated with oncology care. Additionally, the finding is misleading because Respondents fail to identify Dr. Cote's report as the source from which the entire finding was copied and pasted verbatim. (RX3869 (Cote Report) ¶ 257).

The proposed finding is vague because the terms "glycoproteomics" and "immuno-oncology" are undefined. Therefore, the Court should disregard the proposed finding.

563.1 In a 181–sample case control study with 45 samples from patients with pancreatic ductal adenocarcinoma and 136 control samples, the Dawn pancreatic cancer screening test achieved sensitivity of 91% and specificity of 86%. (RX3403 (Kasi et al., 2020) at 1–2.)

Response to Finding No. 563.1

The proposed finding is misleading, vague, and contains unreliable hearsay evidence.

The proposed finding is misleading because Respondents fail to identify Dr. Cote's report as the source from which the entire finding was copied and pasted verbatim. (RX3869 (Cote Report) ¶ 257). The proposed finding is vague because the term "pancreatic ductal adenocarcinoma" is undefined.

This proposed finding also contains unreliable hearsay evidence. Respondents cite a journal article to represent the capabilities of Dawn, not a document was produced by InterVenn. The document itself constitutes unreliable hearsay. It is an untested statement, not produced by InterVenn, which Respondents offer for the truth. Nowhere in this journal article (RX3403) is it apparent that the results being discussed relate to InterVenn's current Dawn product. As such, it is not reliable evidence for Dawn's capabilities or purported applications. Therefore, the Court should disregard the proposed finding.

4. **Seer**

564. Seer, Inc. ("Seer") is a biotechnology company based in Redwood City, California. (RX3774 (Seer) at 1.) Seer has a proteomics platform—not NGS—that may be used to develop multi-cancer screening tests. (RX3869 (Cote Expert Report) ¶ 258.) Seer's subsidiary, PrognomIQ, is known to be developing early cancer detection tests. (RX3869 (Cote Expert Report) ¶ 258.)

Response to Finding No. 564

The proposed finding is improper, unreliable, and vague. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report to support the second and third sentences, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 258; *see* Order on Post-Trial Findings at 3). Respondents improperly rely on Dr. Cote's expert opinions to support this portion of the proposed finding, in contravention of this Court's Order, and therefore this Court

should disregard the second and third sentences of Respondents' proposed finding.

[redacted]

Complaint Counsel objects to Respondents' misattribution of RX3774, a document of unknown provenance, to Seer as the source of the document, in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3. The document was not produced by Seer. Respondents elected not to pursue any form of discovery from Seer in this action. The document itself constitutes unreliable hearsay. It is an untested statement, not produced by Seer, which Respondents offer for the truth and attribute to a party that did not testify in this proceeding. Given the inherent unreliable nature of the document, it lacks probative value (*see* Rule 4.43(b)). This court should disregard RX3774.

The proposed finding is vague because the term "proteomics platform" is undefined. Therefore, this Court should disregard the proposed finding.

a. Seer's ProteographTM proteomics platform

565. Seer is developing a ProteographTM automated workflow proteomics platform that combines its proprietary magnetic nanoparticles for highly parallel protein separation with

commonly used liquid chromatography-mass spectrometry (LC-MS) technology for efficient proteomic profiling. (RX1605 (Blume et al., 2020) at 1–14.)

Response to Finding No. 565

The proposed finding is misleading and vague. Respondents' citation to RX1605 is in contravention of this Court's Order regarding post-trial findings. This Court ordered that "[w]hen citing to exhibits, the parties shall identify the document by the PX or RX number, followed by the name of the entity that produced the document, and the page number." (Order on Post-Trial Findings at 3). RX1605 is a 14-page document, so Respondents' citation to pages 1-14 comprises the entire document. Thus, Respondents fail to provide a citation to specific page number or page range in contravention of the Court's Order. The Court should disregard this proposed evidence.

The proposed finding is misleading because Respondents fail to identify Dr. Cote's report as the source from which the entire finding was copied and pasted verbatim. (RX3869 (Cote Report) ¶ 259).

The proposed finding is vague because the terms "proteomics platform," "magnetic nanoparticles," "liquid chromatography-mass spectrometry," and "proteomic profiling" are undefined. Therefore, this Court should disregard the proposed finding.

> 565.1 The Proteograph platform allows for multiplexing of the protein markers using tandem mass tags (TMTs), thus increasing the throughput of proteomic detections. (RX1605 (Blume et al., 2020) at 1–14; RX3869 (Cote Expert Report) ¶ 259.)

Response to Finding No. 565.1

The proposed finding is improper and vague. Respondents' citation to RX1605 is in contravention of this Court's Order regarding post-trial findings. This Court ordered that "[w]hen citing to exhibits, the parties shall identify the document by the PX or RX number, followed by the name of the entity that produced the document, and the page number." (Order on

Post-Trial Findings at 3). RX1605 is a 14-page document, so Respondents' citation to pages 1-14 comprises the entire document. Thus, Respondents fail to provide a citation to specific page number or page range in contravention of the Court's Order. The Court should disregard this proposed evidence.

The only other support that Respondents rely on for the proposed finding is Dr. Cote's expert report, which is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents improperly rely on Dr. Cote's report for support, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 259; *see* Order on Post-Trial Findings at 3). Therefore, this Court should disregard Respondents' proposed finding.

The proposed finding is vague because the terms "multiplexing," tandem mass tags (TMTs)," and "proteomic detections" are undefined.

566. Seer has used its Proteograph platform to detect over 2,000 proteins from blood plasma samples of healthy and non-small cell lung cancer patients in a cancer classification study, demonstrating the applicability of the Proteograph platform to early cancer screening. (RX1605 (Blume et al., 2020) at 1–14.)

Response to Finding No. 566

The proposed finding is misleading and vague. Respondents' citation to RX1605 is in contravention of this Court's Order regarding post-trial findings. This Court ordered that "[w]hen citing to exhibits, the parties shall identify the document by the PX or RX number, followed by the name of the entity that produced the document, and the page number." (Order on Post-Trial Findings at 3). RX1605 is a 14-page document, so Respondents' citation to pages 1-14 comprises the entire document. Thus, Respondents fail to provide a citation to specific page number or page range in contravention of the Court's Order. The Court should disregard this

proposed evidence.

The proposed finding is misleading because Respondents fail to identify Dr. Cote's report as the source from which the entire finding was copied and pasted verbatim. (RX3869 (Cote Report) ¶ 260).

The proposed finding is vague because it does not specify or explain how detecting over 2,000 proteins from blood plasma samples demonstrates the applicability of the "Proteograph platform" to early cancer screening. Additionally, the term "non-small cell" is undefined. Therefore, this Court should disregard the proposed finding.

> 566.1 In a 288 participant study with 125 lung cancer patients, 81 patients with comorbidity, and 82 health individuals, Seer's Proteograph platform was used to analyze 1779 plasma proteins and Seer identified clusters of proteins with at least 10 members that should differential behavior in lung cancer patients compared with healthy and comorbid individuals. (RX3632 (Siddiqui et al., 2020) at 1; RX3869 (Cote Expert Report) ¶ 260.)

Response to Finding No. 566.1

The proposed finding is vague and confusing because the phrase "should differential behavior" does not make sense. Additionally, the term "10 members" is ambiguous and undefined. It is unclear if "10 members" refers to clusters of proteins, participants of the study, or something else entirely. Therefore, this Court should disregard the proposed finding.

567. Seer currently does not have any clinical trials listed on clinicaltrials.gov. (RX3869 (Cote Expert Report) ¶ 261.)

Response to Finding No. 567

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report to support this proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 261; *see* Order on

Post-Trial Findings at 3). And, moreover, the quoted portion of Dr. Cote's report—i.e., the entire proposed finding—does not contain any factual citation at all, as it originally appeared in Dr. Cote's report. (RX3869 (Cote Report) ¶ 261). Respondents improperly rely on Dr. Cote's expert opinions to support this proposed finding, in contravention of this Court's Order, and otherwise have never provided any evidence to support this proposed finding, either here or in Dr. Cote's report, and therefore this Court should disregard Respondents' proposed finding.

b. PrognomiQ

568. PrognomiQ is a subsidiary and a recent spin-off of Seer. (RX3869 (Cote Expert Report) ¶ 262.) It is also developing early cancer screening tests by combining rich proteomic information, obtainable using Seer's Proteograph platform, with genomic, metabolomic, and other health data. (RX3587 (PrognomiQ) at 2.) There are no details available publicly about PrognomiQ's technologies or plans. (RX3869 (Cote Expert Report) ¶ 262.)

Response to Finding No. 568

The proposed finding, which consists of language copied and pasted verbatim from Dr. Cote's report, is unsupported, improper, and vague. It is unsupported because RX3587, a document pulled from PrognomiQ's website, does not support the claim that PrognomiQ is developing early cancer screening tests using Seer's Proteograph platform. Although RX3587 acknowledges that PrognomiQ is "developing transformative test products that enable early disease detection and treatment," the document says nothing about cancer specifically. Additionally, RX3587 does not mention Seer's Proteograph platform.

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report to support the first and third sentences, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 262; *see* Order on Post-Trial Findings at 3). Respondents improperly rely on Dr. Cote's expert opinions to

support this portion of the proposed finding, in contravention of this Court's Order, and therefore this Court should disregard the first and third sentences of Respondents' proposed finding.

The proposed finding is vague because the term "proteomics information" is undefined, and "genomic, metabolomic, and other health data" is ambiguous. Therefore, this Court should disregard the proposed finding.

569. PrognomiQ currently does not have any clinical trials listed on clinicaltrials.gov. (RX3869 (Cote Expert Report) ¶ 263.)

Response to Finding No. 569

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report to support this proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 263; *see* Order on Post-Trial Findings at 3). And, moreover, the quoted portion of Dr. Cote's report—i.e., the entire proposed finding—does not contain any factual citation at all, as it originally appeared in Dr. Cote's report. (RX3869 (Cote Report) ¶ 263). Respondents improperly rely on Dr. Cote's expert opinions to support this proposed finding, in contravention of this Court's Order, and otherwise have never provided any evidence to support this proposed finding, either here or in Dr. Cote's report, and therefore this Court should disregard Respondents' proposed finding.

5. **Somalogic**

570. Somalogic is a biotechnology company based in Boulder, Colorado. (RX3869 (Cote Expert Report) ¶ 264.) Somalogic has a proteomics platform—not NGS—that may be used to develop screening tests for multiple cancers. (RX3869 (Cote Expert Report) ¶ 264.) Somalogic is known to be developing an early cancer detection test for lung cancer. (RX3869 (Cote Expert Report) ¶ 264.)

Response to Finding No. 570

The proposed finding is improper, unreliable, and vague. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report to support this proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 264; *see* Order on Post-Trial Findings at 3). And, moreover, the quoted portion of Dr. Cote's report—i.e., the entire proposed finding—does not contain any factual citation at all, as it originally appeared in Dr. Cote's report. (RX3869 (Cote Report) ¶ 264). Respondents improperly rely on Dr. Cote's expert opinions to support this proposed finding, in contravention of this Court's Order, and otherwise have never provided any evidence to support this proposed finding, either here or in Dr. Cote's report, and therefore this Court should disregard Respondents' proposed finding.

[redacted]

The proposed finding is vague because the term "proteomics platform" is undefined.

Therefore, this Court should disregard the proposed finding.

571. Somalogic developed an aptamer-microarray based proteomics platform called SomaScan that can measure approximately 7,000 unique human protein analytes in small volumes of biological samples. (RX3651 (Somalogic) at 1–7.)

Response to Finding No. 571

The proposed finding is misleading, vague, and unreliable. It is misleading because Respondents fail to identify Dr. Cote's report as the source from which the entire finding was copied and pasted verbatim. (RX3869 (Cote Report) ¶ 265).

The proposed finding is vague because the terms "aptamer-microarray," "proteomics platform," and "protein analytes" are undefined. Additionally, the term "small volumes" is ambiguous.

Complaint Counsel also objects to the attribution of RX3651, a document of unknown provenance, to Somalogic, in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3. The document was not produced by Somalogic. Respondents elected not to pursue any form of discovery from Somalogic in this action. The document itself constitutes unreliable hearsay. It is an untested statement, not produced by Somalogic, which Respondents offer for the truth and attribute to a party that did not testify in this proceeding. Given the inherent unreliable nature of the document, it lacks probative value (*see* Rule 4.43(b)). This court should disregard RX3651 and the proposed finding.

571.1 The SomaScan Platform uses a proprietary protein-capture reagents called SOMAmer® (Slow Off-rate Modified Aptamer) reagents, which consist of short single-stranded DNA sequences with hydrophobic modifications. (RX3869 (Cote Expert Report) ¶ 265.)

Response to Finding No. 571.1

The proposed finding is improper, unreliable, and vague. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions

that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report to support the proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 265; *see* Order on Post-Trial Findings at 3). And, moreover, the quoted portion of Dr. Cote's report—i.e., the entire proposed finding—does not contain any factual citation at all, as it originally appeared in Dr. Cote's report. (RX3869 (Cote Report) ¶ 265). Respondents improperly rely on Dr. Cote's expert opinions to support this proposed finding, in contravention of this Court's Order, and otherwise have never provided any evidence to support this proposed finding, either here or in Dr. Cote's report, and therefore this Court should disregard Respondents' proposed finding.

[redacted]

The proposed finding is vague because the terms "protein-capture reagents," "Slow Off-rate Modified Aptamer) reagents," and "hydrophobic modifications" are undefined. Therefore, this Court should disregard the proposed finding.

571.2 These chemical modifications facilitate the aptamer binding to proteins and enhance the specificity and affinity of protein-nucleic acid interactions. (RX3869 (Cote Expert Report) ¶ 265.) As a result, these modified aptamers can bind target proteins with specificity, and also be recognizable as nucleotide sequences by specific DNA hybridization probes. (RX3869 (Cote Expert Report) ¶ 265.)

Response to Finding No. 571.2

The proposed finding is improper, unreliable, and vague. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report to support the proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 265; *see* Order on Post-Trial Findings at 3). And, moreover, the quoted portion of Dr. Cote's report—i.e., the entire proposed finding—does not contain any factual citation at all, as it originally appeared in Dr. Cote's report. (RX3869 (Cote Report) ¶ 265). Respondents improperly rely on Dr. Cote's expert opinions to support this proposed finding, in contravention of this Court's Order, and otherwise have never provided any evidence to support this proposed finding, either here or in Dr. Cote's report, and therefore this Court should disregard Respondents' proposed finding.

[redacted]

[redacted]

The proposed finding is vague because the terms "aptamer," "protein-nucleic acid interactions," "nucleotide sequences," and "DNA hybridization probes" are undefined. Additionally, the opening phrase "these chemical modifications" are ambiguous. Respondents do not provide adequate context to infer what modifications are referred to. Therefore, this Court should disregard the proposed finding.

> 571.3 The SomaScan Platform measures the levels of target proteins by capturing them using these unique target-binding, fluorescent labeled aptamers, and then measures the corresponding aptamer concentrations using microarrays of complementary DNA probes. (RX3651 (Somalogic) at 1–7; (RX3869 (Cote Expert Report) ¶ 265.).)

Response to Finding No. 571.3

The proposed finding is unsupported, improper, vague, and unreliable. It is unclear how RX3651 provides any support for the proposed finding because the document does not mention "fluorescent labeled aptamers," "corresponding aptamer concentrations," or "complementary DNA probes." Complaint Counsel objects to the attribution of RX3651, a document of unknown provenance, to Somalogic, in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3. The document was not produced by Somalogic. Respondents elected not to pursue any form of discovery from Somalogic in this action. The document itself constitutes unreliable hearsay. It is an untested statement, not produced by Somalogic, which Respondents offer for the truth and attribute to a party that did not testify in this proceeding. Given the inherent unreliable nature of the document, it lacks probative value (*see* Rule 4.43(b)). This court should disregard RX3651. Respondents' citation to RX3651 also contravenes this Court's Order regarding post-trial findings. This Court ordered that "[w]hen citing to exhibits, the parties shall identify the document by the PX or RX number, followed by the name of the entity

that produced the document, and the page number." (Order on Post-Trial Findings at 3). RX3651 is a seven-page document, so Respondents' citation to pages 1-7 comprises the entire document. Thus, Respondents fail to provide a citation to specific page number or page range in contravention of the Court's Order. The Court should disregard this proposed evidence.

The only other support that Respondents rely on for the proposed finding is Dr. Cote's expert report, which is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents improperly rely on Dr. Cote's report for support, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 265; *see* Order on Post-Trial Findings at 3). Therefore, this Court should disregard Respondents' proposed finding.

The proposed finding is vague because the terms "target-binding, fluorescent labeled aptamers," "aptamer concentrations," and "complementary DNA probes" are undefined

572. As a highly multiplexed, sensitive, quantitative, and reproducible proteomic tool, the SomaScan platform is not only used for identification of relevant protein biomarkers relating to cancers, but also for biomarker detection and analysis. (RX3869 (Cote Expert Report) ¶ 266.)

Response to Finding No. 572

The proposed finding is improper, unreliable, and vague. The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report to support the proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 266; *see* Order on Post-Trial Findings at 3). And, moreover, the quoted portion of Dr. Cote's report—i.e., the entire proposed finding—does not

contain any factual citation at all, as it originally appeared in Dr. Cote's report. (RX3869 (Cote Report) ¶ 266). Respondents improperly rely on Dr. Cote's expert opinions to support this proposed finding, in contravention of this Court's Order, and otherwise have never provided any evidence to support this proposed finding, either here or in Dr. Cote's report, and therefore this Court should disregard Respondents' proposed finding.

572.1 For example, researchers at the Indiana University School of Medicine recently used the SomaScan platform to identify potential serum protein biomarkers and pathways for pancreatic cancer cachexia. (RX3471 (Narasimhan et al., 2020) at 1–23.)

Response to Finding No. 572.1

The proposed finding is misleading and vague. Respondents' citation to RX3471 is in contravention of this Court's Order regarding post-trial findings. This Court ordered that "[w]hen citing to exhibits, the parties shall identify the document by the PX or RX number, followed by the name of the entity that produced the document, and the page number." (Order on Post-Trial Findings at 3). RX3471 is a 23-page document, so Respondents' citation to pages 1-23 comprises the entire document. Thus, Respondents fail to provide a citation to specific page number or page range in contravention of the Court's Order. The Court should disregard this proposed evidence.

The proposed finding is misleading because Respondents fail to identify Dr. Cote's report as the source from which the entire finding was copied and pasted verbatim. (RX3869 (Cote Report) ¶ 266).

The proposed finding is vague because the terms "the SomaScan platform," "serum protein biomarkers" and "cachexia" are undefined. Therefore, this Court should disregard the proposed finding.

572.2 Researchers at MIT used the SomaScan platform, in part, to identify a panel of prostate cancer proteases biomarkers. (RX3177 (Dudani et al., 2018) at 1–6.)

Response to Finding No. 572.2

The proposed finding is misleading and vague. Respondents' citation to RX3177 is in contravention of this Court's Order regarding post-trial findings. This Court ordered that "[w]hen citing to exhibits, the parties shall identify the document by the PX or RX number, followed by the name of the entity that produced the document, and the page number." (Order on Post-Trial Findings at 3). RX3177 is a six-page document, so Respondents' citation to pages 1-6 comprises the entire document. Thus, Respondents fail to provide a citation to specific page number or page range in contravention of the Court's Order. The Court should disregard this proposed evidence.

The proposed finding is misleading because Respondents fail to identify Dr. Cote's report as the source from which the entire finding was copied and pasted verbatim. (RX3869 (Cote Report) ¶ 266).

The proposed finding is vague because the terms "the SomaScan platform" and "proteases" are undefined and the phrase "in part" is ambiguous. Therefore, this Court should disregard the proposed finding.

572.3 Researchers in Germany also used the SomaScan platform to identify links between the recurrence of ovarian carcinoma and proteins released into the tumor microenvironment. (RX3229 (Finkernagel et al., 2019) at 1–2.)

Response to Finding No. 572.3

The proposed finding is misleading and vague. It is misleading because Respondents fail to identify Dr. Cote's report as the source from which the entire finding was copied and pasted verbatim. (RX3869 (Cote Report) ¶ 266). The proposed finding is vague because the terms "[r]esearchers in Germany," "the SomaScan platform," "to identify links" and "tumor microenvironment" are undefined. Therefore, this Court should disregard the proposed finding.

572.4 Researchers in the U.K. and Spain collaborated with Somalogic to use the SomaScan platform to analyze protein biomarkers isolated from exosomes in plasma and urine of prostate cancer patients. (RX3738 (Welton et al., 2016) at 1–2; RX3736 (Webber et al., 2014) at 1.)

Response to Finding No. 572.4

The proposed finding is misleading and vague. The proposed finding is misleading because Respondents fail to identify Dr. Cote's report as the source from which the entire finding was copied and pasted verbatim. (RX3869 (Cote Report) ¶ 266). The proposed finding is vague because the terms "[r]esearchers," "collaborated with," and "SomaScan platform" are undefined. Therefore, this Court should disregard the proposed finding.

573. Somalogic currently does not have any clinical trials relating to screening for multiple cancers listed on clinicaltrials.gov. (RX3869 (Cote Expert Report) ¶ 267.)

Response to Finding No. 573

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding is a direct quote from Dr. Cote's expert report, and Respondents cite only to Dr. Cote's report to support this proposed finding, in contravention of this Court's Order. (RX3869 (Cote Report) ¶ 267; *see* Order on Post-Trial Findings at 3). And, moreover, the quoted portion of Dr. Cote's report—i.e., the entire proposed finding—does not contain any factual citation at all, as it originally appeared in Dr. Cote's report. (RX3869 (Cote Report) ¶ 267). Respondents improperly rely on Dr. Cote's expert opinions to support this proposed finding, in contravention of this Court's Order, and otherwise have never provided any evidence to support this proposed finding, either here or in Dr. Cote's report, and therefore this Court should disregard Respondents' proposed finding.

IV. NGS COMPETITION

A. Current Players

1. **Illumina**

574. Illumina entered the sequencing market following its acquisition of Solexa in 2006 and its subsequent debut of its first instrument, the Genome Analyzer, in 2007. (PX0091 (Illumina) at 4; RX3407 (Kircher et al., 2010) at 5.) The Genome Analyzer was capable of simultaneously sequencing several million very short sequences (up to 26 nucleotides) in a single sequencing run. (RX3407 (Kircher et al., 2010).)

Response to Finding No. 574

Complaint Counsel objects to the proposed finding as misleading and unsupported because it suggests that Illumina, not Solexa, initially developed the Genome Analyzer NGS platform and brought it to market. Illumina only acquired Solexa in "November 2006" (PX0091 (Illumina) at 004 (Illumina, Source Book, August 2020)), and the Solexa sequencer then immediately launched in "early 2007" (RX3407 (Illumina) at 5 (Kircher et al., 2010)). Therefore, this Court should disregard the proposed finding.

574.1 Since the introduction of the Genome Analyzer, Illumina has significantly improved its NGS sequencers' capabilities. Initially, the length of the sequence reads were limited to 26 nucleotides because of steeply increasing sequencing errors as the reads became longer. (RX3407 (Kircher et al., 2010).)

Response to Finding No. 574.1

Complaint Counsel has no specific response to this proposed finding.

574.2 Within three years of its introduction, the Genome Analyzer was able to simultaneously sequence more than 200 million fragments per run and generate sequence reads of up to 100 nucleotides from each strand, generating more than 50 Gb of sequence output. (RX3407 (Kircher et al., 2010).)

Response to Finding No. 574.2

Complaint Counsel objects to the proposed finding as unsupported. The source cited (RX3407) does not provide that within three years of its introduction, the Genome Analyzer was able to generate more than 50 gigabases of total sequence output per run. It appears Respondents' counsel must have derived that figure by performing a calculation, incorrectly. In fact, sequencing 200 million fragments to a read length of 100 nucleotides each would only

generate 20 gigabases of total sequence output per run (or 40 gigabases if running in paired end mode to sequence each fragment in both directions). Therefore, this Court should disregard the proposed finding.

574.3 The Genome Analyzer was replaced in 2010 by the HiSeq sequencers, which were subsequently replaced by the NovaSeq sequencers. (RX3869 (Cote Expert Report) ¶ 276.)

Response to Finding No. 574.3

Complaint Counsel objects to the proposed finding because it constitutes improper expert opinion. This Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote in an attempt to establish a purported fact—that the original Solexa Genome Analyzer was replaced in 2010 by the Illumina HiSeq and then the NovaSeq—in contravention of this Court's Order. The Court should disregard this evidence and the proposed finding.

575. Illumina currently provides five classes of NGS sequencers based on the same sequencing-by-synthesis mechanism of action. The below chart shows each of the Illumina instruments and their current throughput:

Table 3

Instrument(s)	Throughput	Read Length	Run Time
iSeq	Simultaneous sequencing of 4 million DNA fragments	2x150 nucleotides to generate outputs of -1.2 Gb per run	8–19 hours
MiniSeq	Simultaneous sequencing of 8–25 million DNA fragments	2x150 nucleotides to generate outputs of -1.9 to -7.5 Gb per run.	4–24 hours
MiSeq	Simultaneous sequencing of 1–25 million DNA fragments	2x150 to 3x300 nucleotides to generate outputs of -300 Mbp to -15 Gb per run	10–56 hours
NextSeq 500	Simultaneous sequencing of 130– 400 million DNA fragments	2x150 nucleotides to generate outputs of - 40 to 120 Gb per run	15–29 hours

Instrument(s)	Throughput	Read Length	Run Time
NextSeq 550/550 Dx	Simultaneous sequencing of 130– 400 million DNA fragments	2x150 nucleotides to generate outputs of - 16.25 to 120 Gb per run	12–30 hours
NextSeq 2000	Simultaneous sequencing of 400 million to 1.2 billion DNA fragments	2x150 nucleotides to generate outputs of - 40 to 360 Gb per run	11–48 hours
HiSeq X (discontinued)	Simultaneous sequencing of 6 billion DNA fragments	2x150 nucleotides to generate outputs of -1600 to -1800 Gb per run	
NovaSeq 6000	Simultaneous sequencing of 800 million to 20 billion DNA fragments	2x150 to 2x250 nucleotides to generate outputs of -80 Gb to -6 Tb per run	13–45 hours
[redacted]	[redacted]	[redacted]	[redacted]

(RX3357 (Illumina) at 6–7; RX3354 (Illumina) RX3353 (Illumina,); RX3364 (Illumina); (RX3371 (Illumina); RX1600 (Illumina) at 19, 25); PX0091 (Illumina) at 11.)

Response to Finding No. 575

[redacted]

[redacted]

576. Illumina NGS sequencers are about 99.9% accurate (>87% of bases >Q30) in calling the correct base from the DNA sequence. (RX3368 (Illumina).)

Response to Finding No. 576

Complaint Counsel has no specific response to this proposed finding.

577. Illumina's improvements to its sequencing technology have driven down the cost of sequencing dramatically. Twenty years ago, the human genome project took the joint effort of more than 200 scientists 13 years and about $3 billion to read a single human genome of about 3 Gbs. (RX3113 (Hayden) at 1–2.)

Response to Finding No. 577

Complaint Counsel objects to the proposed finding because it is unsupported, in that it cites no source for the assertion that Illumina's improvements to its sequencing technology have driven down the cost of sequencing dramatically.

Complaint Counsel has no other specific response to this proposed finding.

577.1 When Illumina introduced the Genome Analyzer, the cost to sequence a full human genome was about $10 million, which dropped to about $200,000 in 2009. (RX3113 (Hayden) at 1; RX3370 (Illumina).)

Response to Finding No. 577.1

Complaint Counsel has no specific response to this proposed finding.

577.2 In January 2014, Illumina announced the achievement of $1000 genome with its introduction of the HiSeq X system at 30x coverage (about 100 Gbs). (RX3370 (Illumina).)

Response to Finding No. 577.2

Complaint Counsel has no specific response to this proposed finding.

577.3 In August 2020, Illumina announced the introduction of the $600 genome with the NovaSeqTM 6000 v1.5 Reagent Kit. (RX3355 (Illumina).)

Response to Finding No. 577.3

Complaint Counsel has no specific response to this proposed finding.

577.4 [redacted]

Response to Finding No. 577.4

[redacted]

[redacted]

[redacted]

2. **Thermo Fisher**

578. Thermo Fisher Scientific, based in Waltham, Massachusetts, offers the Ion Torrent line of NGS platforms. (RX2577 (Thermo Fisher) at 1.) Thermo Fisher inherited the Ion Torrent brand via its merger with Life Technologies and Life's prior acquisition of Ion Torrent Systems Inc. (PX7070 (Felton (Thermo Fisher) IHT at 11.) Ion Torrent Systems Inc. developed and released the Ion Torrent NGS sequencers in 2010. (PX2482 (Thermo Fisher) at 50.)

Response to Finding No. 578

Complaint Counsel has no specific response to the proposed finding.

578.1 As with the Illumina sequencers, the nucleic acids to be sequenced must undergo sample preparation before sequencing. (RX3869 (Cote Expert Report) ¶ 281.) The DNA fragments are attached to microscopic beads and the fragments undergo amplification using PCR so that each bead is covered with many copies of the fragment to be sequenced. (RX3869 (Cote Expert Report) ¶ 281.) Each time a nucleotide is incorporated into the sequence (e.g., for the sequencing by synthesis), a hydrogen ion is released. (RX3690 (Thermo Fisher) at 2–3.)

Response to Finding No. 578.1

Complaint Counsel objects to the proposed finding because it improperly cites expert testimony, is misleading, and is against the weight of the evidence.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote to support purported basic facts about Thermo Fisher Ion Torrent sequencers, in contravention of this Court's Order. This Court should disregard this evidence.

The proposed finding is misleading to the extent that "[a]s with Illumina sequencers" suggests sample preparation for Thermo Fisher's instruments is related to or interchangeable

with sample preparation for Illumina instruments. The proposed finding is also misleading to the extent it implies that Thermo Fischer Scientific's NGS platform is interchangeable with Illumina's NGS platforms.

[redacted] Therefore, this Court should disregard the proposed finding.

578.2 The Ion Torrent sequencers use semiconductors to measure the pH change resulting from the release of hydrogen ions during the incorporation reaction to identify the nucleotides in the sample being sequenced. (RX3690 (Thermo Fisher) at 3.)

Response to Finding No. 578.2

Complaint Counsel has no specific response to the proposed finding.

579. Thermo Fisher currently markets four Ion Torrent NGS systems: the Ion PGM Dx System, the Ion Proton System, the Ion GeneStudio S5 Systems, and the Ion Torrent Genexus System. The below chart shows each of the Thermo Fisher instruments and their current throughput:

Table 4

Instrument(s)	Throughput	Read Length	Run Time
Ion PGM Dx	Simultaneous sequencing of 4 to 5.5 million DNA fragments	200 nucleotides to generate outputs of ~ 0.6 to ~1 Gb per run	4.4 hours
Ion Proton	Simultaneous sequencing of ~ 60 to 80 million DNA fragments	200 nucleotides to generate outputs of up to 15 Gb per run	~2.5 hours
Ion GeneStudio S5	Simultaneous sequencing of ~ 2 to 130 million DNA fragments	200 to 600 nucleotides to generate outputs of ~ 0.3 to 50 Gb per run	~3 to 12 hours
Ion Torrent Genexus	Simultaneous sequencing of ~ 48 to 60 million DNA fragments	200 to 400 nucleotides to generate outputs of 10 to 12 Gb per run	12 hours

(RX3688 (Thermo Fisher); RX3689 (Thermo Fisher); RX3687 (Thermo Fisher); RX3685 (Thermo Fisher).)

Response to Finding No. 579

Complaint Counsel objects to the proposed finding as unsupported because the source cited (RX3685) that discusses the Ion Torrent Genexus sequencer does not provide that the run time of the instrument is "12 hours." Complaint Counsel does not disagree with the remainder of the proposed finding.

580. The Ion Torrent NGS sequencers are about 98.4–99.2% accurate (>Q20) in calling the correct base from the DNA sequence. (RX3693 (Thermo Fisher).) Thermo Fisher's Ion Torrent sequencers' run time is typically less than 12 hours, comparable to Illumina's 11–45 hours run time for the NextSeq and NovaSeq NGS sequencers. (RX3869 (Cote Expert Report) ¶ 282.)

Response to Finding No. 580

Complaint Counsel objects to the proposed finding because it is unsupported, incorrect, misleading, and constitutes improper expert opinion.

The proposed finding claims the Ion Torrent NGS sequencers are "about 98.4-99.2% accurate" and characterizes that accuracy range as ">Q20," which is incorrect. The source cited (RX3693)—a 36-page document to which Respondents do not provide a specific page cite, in contravention of this Court's Post-Trial Order, which explicitly requires that all facts be supported by "specific references to the evidentiary record" (*see* Order on Post-Trial Findings at 2)—does not characterize this accuracy range as ">Q20." Respondents' counsel must have added the ">Q20" descriptor, without understanding precisely what it means or that it is incorrect. In fact, Q20 means 99% accuracy. (*See, e.g.*, RX3541 (Oxford Nanopore) at 2 (Oxford Nanopore Tech Update, May 21, 2021) (explaining that its "Q20+" chemistry generates >99% accuracy)). The purported accuracy range of "about 98.4-99.2" for Thermo Fisher Ion Torrent sequencers, therefore, dips substantially below Q20.

This Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote in an attempt to establish purported facts—the run times of Thermo

Fisher and Illumina sequencers—in contravention of this Court's Order. The Court should disregard this evidence and disregard the proposed finding as unsupported.

The proposed finding is misleading because it compares only the run times between the Thermo Fisher Ion Torrent sequencers and Illumina NextSeq and NovaSeq sequencers, divorced from the number of reads, accuracy, and cost of the respective runs. [redacted]

Therefore, this Court should disregard the proposed finding.

581. Thermo Fisher's Ion GeneStudio S5 Systems are also equipped to perform three types of genome-wide methylation profiling strategies: (i) bisulfite conversion; (ii) enzymatic genomic partition to separate the genome into methylated and unmethylated compartments with methylation-sensitive restriction enzymes, thus allowing more sensitive detection of DNA methylation through NGS sequencing; and (iii) enrichment of methylated DNA using affinity purification of methylated genomic DNA fragments, thus similarly allowing more sensitive detection of DNA methylation through NGS sequencing. (RX3691 (Thermo Fisher).)

Response to Finding No. 581

Complaint Counsel objects to the proposed finding because it is vague, misleading, and against the weight of the evidence.

The proposed finding's use of "more sensitive detection" is vague because it does not specific what it is purportedly more sensitive than.

The proposed finding is misleading to the extent that it suggests Thermo Fisher's Ion GeneStudio S5 system is in any way unique in its capability to sequence DNA samples that have undergone bisulfite conversion, enzymatic genomic partitioning, or enrichment of methylated DNA to preserve methylation status. Nothing in the source cited (RX3691), which purports to be a capture of a page from Thermo Fisher's website, states that Thermo Fisher has any unique or proprietary capability in this regard.

The proposed finding is also misleading to the extent that it suggests Thermo Fisher's Ion GeneStudio S5 system can be used for MCED testing. Nothing in the source cited (RX3691), which purports to be a capture of a page from Thermo Fisher's website, mentions MCED testing or even any liquid biopsy application.

The proposed finding is also misleading to the extent it implies that Thermo Fischer Scientific's NGS platform is interchangeable with Illumina's NGS platforms. [redacted]

[redacted] Therefore, this Court should disregard the proposed finding.

581.1 Thermo Fisher also offers chromatin immunoprecipitation sequencing ("ChIP-Seq") for its Ion Torrent sequencers. (RX3680 (Thermo Fisher).)

Response to Finding No. 581.1

Complaint Counsel objects to the proposed finding because it is misleading.

The proposed finding is misleading to the extent it suggests Thermo Fisher's Ion Torrent sequencers can be used for MCED testing. Nothing in the source cited (RX3680), which purports to be a capture of a page from Thermo Fisher's website, mentions MCED testing or even any liquid biopsy application.

The proposed finding is also misleading to the extent it implies that Thermo Fischer Scientific's NGS platform is interchangeable with Illumina's NGS platforms. [redacted]

Therefore, this Court should disregard the proposed finding.

581.2 Researchers have also developed protocols to perform methylated DNA immunoprecipitation sequencing ("MeDIP-Seq") using Thermo Fisher's Ion Torrent sequencers; MeDIP Seq may be used to study DNA methylation genome-wide. (RX3158 (Corley et al., 2015).)

Response to Finding No. 581.2

Complaint Counsel objects to the proposed finding because it is misleading.

The proposed finding is misleading to the extent it suggests Thermo Fisher's Ion Torrent sequencers can be used for MCED testing. Nothing in the research paper cited (RX3158), which Respondents cite with no additional context, mentions MCED testing or even any liquid biopsy application.

The proposed finding is also misleading to the extent it implies that Thermo Fischer Scientific's NGS platform is interchangeable with Illumina's NGS platforms. [redacted]

Therefore, this Court should disregard the proposed finding.

582. Thermo Fisher's share of the clinical oncology segment has increased over the last five years. (PX7097 (Felton (Thermo Fisher) Dep. at 91).) [redacted]

Response to Finding No. 582

[redacted]

[redacted]

583. [redacted]

Response to Finding No. 583

[redacted]

[redacted]

584. Thermo Fisher will offer its solutions to MCED test developers and agrees that its sequencers are capable of being used for multi-cancer screening tests, and researchers are successfully developing new ways to use Thermo Fisher products for early cancer screening applications. (Felton (Thermo Fisher) Tr. 2021–23; PX7097 (Felton (Thermo Fisher) Dep. at 65–68).)

Response to Finding No. 584

[redacted]

[redacted]

585. Even though the technical parameters of Thermo Fisher's Ion Torrent platform may be inferior to Illumina's high-end sequencers, the Ion Torrent sequencers are nonetheless suitable for certain multi-cancer screening tests. (RX3869 (Cote Expert Report) ¶ 285.)

Response to Finding No. 585

Complaint Counsel objects to the proposed finding because it is vague, relies solely on self-serving expert opinion testimony, is unsupported, and is against the weight of the evidence.

The proposed finding is vague because it does define or quantify what technically

"inferior" means, nor what "suitable" means, nor list which MCED tests are the "certain" ones for which the technically inferior Thermo Fisher Ion Torrent NGS platform is nonetheless suitable.

[redacted] From this Dr. Cote somehow generates the internally inconsistent, vague conclusion that, despite technical inferiority to Illumina, Thermo Fisher's Ion Torrent sequencer is "suitable" for "certain" (unidentified) MCED tests. This opinion contains no true expert analysis and is merely an empty black box entitled to no weight.

[redacted]

[redacted]

[redacted] Therefore, this Court should disregard the proposed finding.

586. If a test developer came to Thermo Fisher and wanted to reconfigure its assay to run on Thermo Fisher's platforms, Thermo Fisher would assist in putting the test onto its platform. (Felton (Thermo Fisher) Tr. 2021–23; PX7097 (Felton (Thermo Fisher) Dep. at 143–44).)

3. **BGI**

587. BGI Genomics, formerly known as the Beijing Genomics Institute, is a Chinese genome sequencing company. (RX3060 (BGI) at 1.) It acquired California-based sequencing company Complete Genomics in 2013 and launched its BGISEQ-500 NGS sequencer in 2015 based on Complete Genomics' core technology. (RX3063 (BGI).)

Response to Finding No. 587

Complaint Counsel objects to the proposed finding because it misattributes the source of documents and is unsupported, incomplete, and misleading.

Complaint Counsel objects to the attribution of RX3060 (a news article *about* BGI, not a BGI document) and RX3063 (which Respondents purportedly captured from BGI's website at a now-broken URL) to BGI as the source of the documents, in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3. Given the inherent unreliable nature of this document, it has little to no probative value. (*See* Rule 4.43(b)). Respondents elected not to pursue any form of discovery from BGI in this action, likely because they know such evidence would not support their contention that BGI will be a feasible alternative NGS platform available to MCED developers in the United States any time in the foreseeable future. Indeed, Illumina has obtained discovery from BGI on this very topic in another proceeding, prompting the court to conclude that BGI's CoolMPS technology is "neither mature nor commercially viable." *Illumina, Inc. v.*

BGI Genomics Co., Ltd., No. 3:19-cv-03770, 2022 WL 899421, at *25 (N.D. Cal. Mar. 27, 2022) (noting the deposition testimony of Jian Wang, BGI's Chairman: "Q: Do you consider the CoolMPS sequencers to be an important product line of BGI? A: No.").

The proposed finding is unsupported because the source cited (RX3063) does not provide that Complete Genomics was based in California or that BGI acquired Complete Genomics in 2013.

The proposed finding is incomplete because BGI is not merely a Chinese genome sequencing company, but rather "it is closely linked to the Chinese government," it "runs a massive gene databank in China," and "U.S. security officials have warned American labs against using Chinese tests for COVID-19 because of concern China was seeking to gather foreign genetic data for its own research." (RX3060 at 1; *see also* deSouza (Illumina) Tr. 2312 ("[BGI is] sponsored by the Chinese government or affiliated with the Chinese government").)

The proposed finding is misleading to the extent it suggests that BGI has ever launched or sold any NGS platform in the United States. The source cited indicates only that the BGISEQ500 sequencer was "available in China." (RX3063 at 2.) In fact, BGI platforms have never been sold in the United States, due in large part to injunctions Illumina has obtained against BGI in patent infringement suits. (*See* CCFF ¶¶ 1269-75.) Illumina is seeking additional injunctive relief against BGI in federal court based on U.S. patents that do not expire until as late as 2027. (*See* CCFF ¶¶ 1276-85.) Therefore, this Court should disregard the proposed finding.

588. BGI's NGS sequencers use an SBS technology that is similar to Illumina's NGS sequencing technology. (RX3869 (Cote Expert Report) ¶ 286.)

Response to Finding No. 588

Complaint Counsel objects to the proposed finding because it constitutes improper expert opinion and is misleading.

This Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote in an attempt to establish a purported fact—that BGI sequencers use an SBS technology similar to Illumina's—in contravention of this Court's Order. The Court should disregard this evidence.

The proposed finding is misleading because it suggests that BGI sequencers perform similarly to Illumina sequencers. [redacted] Therefore, this Court should disregard the proposed finding.

588.1 BGI is currently enjoined from launching its sequencing instruments and related reagents in the United States due to its infringement of a certain Illumina patents that expire in 2022 and 2023. (RX3356 (Businesswire).)

Response to Finding No. 588.1

Complaint Counsel objects to the proposed finding because it is incomplete and misleading in that it suggests Illumina is seeking injunctive relief against BGI based only on patents that expire in 2022 and 2023. In fact, Illumina is seeking additional injunctive relief against BGI in federal court based on U.S. patents that do not expire until as late as 2027. (*See* CCFF ¶¶ 1276-79, 82-83.)

Complaint Counsel does not disagree that to date one federal court has already found that BGI infringed multiple Illumina patents.

588.2 BGI may enter the U.S. market by August 2022. *Illumina, Inc. v. BGI Genomics, Co.*, 20-cv-01465-WHO (N.D. Cal. Mar. 27, 2022), ECF No. 665 at 48 ("If [BGI] make[s] offers to sell Accused Products in the U.S. before the expiration of the

> patents-in-suit—as they are permitted—they must include the following conspicuous written disclaimer: 'No sales will occur, and no purchase orders will be accepted, until after August 23, 2022.'").

Response to Finding No. 588.2

Complaint Counsel objects to the proposed finding because it is unsupported, incomplete, and misleading.

The proposed finding is unsupported in that the court order cited does not provide that "BGI may enter the U.S. market by August 2022." The court order *bars* BGI from entering until after August 23, 2022, but it in no way purports to authorize or permit BGI to "enter the U.S. market" as of that date, nor could it. The federal court in the Northern District of California ruled solely on the case or controversy before it, which involved the limited set of U.S. patents Illumina chose to assert *in that lawsuit only*. The court determined nothing whatsoever regarding other patents, lawsuits, or other legal obstacles that may well block BGI from entering the U.S. market long after August 23, 2022.

The proposed finding is incomplete and misleading in that it suggests Illumina is only seeking injunctive relief against BGI through the suit captioned *Illumina, Inc. v. BGI Genomics, Co.*, 20-cv-01465-WHO (N.D. Cal.), in federal court in the Northern District of California. In fact, Illumina is already seeking additional injunctive relief against BGI in federal court in the District of Delaware in the suit captioned *Complete Genomics, Inc. v. Illumina, Inc.*, Case 1:19-cv-00970-MN (D. Del.), based on patents that do not expire until as late as 2027. (*See* CCFF ¶¶ 1276-79, 82; PX9232 at 015, 025-027 (Answer and Counterclaim, *Complete Genomics, Inc. v. Illumina, Inc.*, Case 1:19-cv-00970-MN (D. Del.) (July 25, 2019); deSouza (Illumina) Tr. 2227). Moreover, Illumina holds additional patents touching "every aspect of the sequencing workflow, including nucleotides, enzymes, reagent mixes, instruments, optics, analysis software, and bioinformatics, which result from Illumina's significant investments in research and

development" that extend to beyond 2030 and which "may become relevant" against BGI. (deSouza (Illumina) Tr. 2231-2232; PX2822 (Illumina) at 006-007 (Baird Non-Deal Roadshow with Alex Aravanis, Feb. 19, 2021)). Therefore, this Court should disregard the proposed finding.

589. BGI's technology also measures the light emission when a fluorescent labeled base is incorporated into the DNA strand. (RX3065 (BGI).) BGI recently introduced a CoolMPSTM (Massively Parallel Sequencing) technology that measures the light emission when a fluorescently-labeled antibody specifically binds to the base that has been incorporated into the DNA strand. (RX3175 (Drmanac et al., 2020).)

Response to Finding No. 589

Complaint Counsel objects to the proposed finding because it misattributes the source of a document and is unsupported, confusing, and vague.

Complaint Counsel objects to the attribution of RX3065 to BGI as the source of the document, in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3. RX3065 appears to be a document from BGI, but it is unclear how, when, and from where Respondents obtained the document. Given the inherent unreliable nature of this document, it has little to no probative value. (*See* Rule 4.43(b)). Respondents elected not to pursue any form of discovery from BGI in this action, likely because they know such evidence would not support their contention that BGI will be a feasible alternative NGS platform available to MCED developers in the United States any time in the foreseeable future. Indeed, Illumina has obtained discovery from BGI on this very topic in another proceeding, prompting the court to conclude that BGI's CoolMPS technology is "neither mature nor commercially viable." *Illumina, Inc. v. BGI Genomics Co., Ltd.*, No. 3:19-cv-03770, 2022 WL 899421, at *25 (N.D. Cal. Mar. 27, 2022) (noting the deposition testimony of Jian Wang, BGI's Chairman: "Q: Do you consider the CoolMPS sequencers to be an important product line of BGI? A: No.").

The proposed finding is unsupported because RX3065 does not say that "BGI's

technology also measures the light emission when a fluorescent labeled base is incorporated into the DNA strand" or even discuss incorporation of DNA bases or light emission. (RX3065.)

The proposed finding is unsupported and confusing because the source cited (RX3065) describes a BGI sequencing service offering, not BGI instruments sold to and operated by individual laboratories, and it is unclear to what extent, if any, the information applies to BGI instruments that were ever sold or offered for sale to independent laboratories.

The proposed finding is vague because it does not define what it means for BGI to have purportedly "introduced" CoolMPS™ technology. The proposed finding is unsupported because the unpublished, non-peer reviewed paper by Drmanac et al. that is cited does not describe any type of commercial launch of the technology but rather explains that CoolMPS™ chemistry is "still at the beginning of the development cycle." (RX3175 at 11, 16.). Therefore, this Court should disregard the proposed finding.

590. BGI currently markets five sequencers. The below chart shows each of the BGI instruments and their current throughput:

Table 5

Instrument(s)	Throughput	Read Length	Run Time
DNBSEQ-G50	Simultaneous sequencing of ~ 100 to 500 million DNA fragments	50 to 2x150 nucleotides to generate outputs of up to ~ 150 Gb per run	10–66 hours
DNBSEQ-G400 FAST	Simultaneous sequencing of ~ 550 million DNA fragments	100 to 2x150 nucleotides to generate outputs of up to 330 Gb per run	13–37 hours
DNBSEQ-G400	Simultaneous sequencing of ~ 1,500 to 1,800 million DNA fragments	50 to 2x200 nucleotides to generate outputs of up to 1,440 Gb (1.44 Tb) per run	13–37 hours
DNBSEQ-T7	Simultaneous sequencing of ~ 20 billion DNA fragments	100 to 2x150 nucleotides to generate outputs of up to 6,000 Gb (6 Tb) per run	<24 hours
DNBSEQ-T10×4RS / DNBSEQ-Tx	Simultaneous sequencing of ~ 80 billion DNA fragments	100 to 2x150 nucleotides to generate outputs of up to 20 Tb per day	<24 hours

(RX3465 (MGI Tech); RX4004 (MGI Tech).)

Response to Finding No. 590

Complaint Counsel objects to the proposed finding because it misattributes the source of a document and is vague, confusing, unsupported, and misleading.

Complaint Counsel objects to the attribution of RX4004 to MGI Tech. (an affiliate of BGI) as the source of the document, in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3. RX4004 appears to be a press release from MGI, but it is printed from a third-party website, and it is unclear whether it has been translated or whether any pictures, including potentially relevant pictures of the DNBSEQ-T10x4RS instrument discussed in the press release, have been omitted (the first page of the exhibit shows a broken image icon). Given the inherent unreliable nature of this document, it has little to no probative value. (*See* Rule 4.43(b)). Respondents elected not to pursue any form of discovery from BGI in this action, likely because they know such evidence would not support their contention that BGI will be a feasible alternative NGS platform available to MCED developers in the United States any time in the foreseeable future. Indeed, Illumina has obtained discovery from BGI on this very topic in another proceeding, prompting the court to conclude that BGI's CoolMPS technology is "neither mature nor commercially viable." *Illumina, Inc. v. BGI Genomics Co., Ltd.*, No. 3:19-cv-03770, 2022 WL 899421, at *25 (N.D. Cal. Mar. 27, 2022) (noting the deposition testimony of Jian Wang, BGI's Chairman: "Q: Do you consider the CoolMPS sequencers to be an important product line of BGI? A: No.").

The proposed finding is vague because it does not make clear that the figures provided in the "Throughput" column refer to the number of fragments that can be sequenced simultaneously per run of the instrument, not per flow cell within each run.

The proposed finding is confusing and misleading because, underneath the "Read

Length" column, it also provides the total output of each instrument run in bases (gigabases or terabases). The total output in bases of a sequencer per run of the instrument (or per period of time) is an irrelevant metric for the application of MCED tests. [redacted]

The proposed finding is unsupported because neither of the cited sources (RX3465 or RX4004) provides any of the metrics listed in the table for the DNBSEQ-G400 FAST sequencer.

The proposed finding is misleading because it claims a run time of "13-37 hours" for the DNBSEQ-G400, but the source cited (RX3465) indicates that short run time only applies when using the small flow cell ("FCS"). (RX3465 at 2.) The run time when using the large flow cell ("FCL"), which would be necessary to realize the "simultaneous sequencing of 1,500 to 1,800 million DNA fragments" claimed in the table, is 14~109 hours. (RX3465 at 2.)

The proposed finding is incomplete because it omits the fact that the DNBSEQ-T7 is only capable of reading "5000M" (5 billion) fragments per flow cell (RX3465 at 2) and presumably must then need to process four flow cells per run to achieve the purported throughput of simultaneously sequencing 20 billion fragments per run.

The proposed finding is unsupported because neither of the cited sources (RX3465 or RX4004) provides that the DNBSEQ-T10x4RS is capable of simultaneous sequencing of ~ 80 billion DNA fragments. The proposed finding is also unsupported because neither of the cited

sources (RX3465 or RX4004) mentions a "DNBSEQ-Tx" sequencer model.

The proposed finding is misleading because it does not clarify that the DNBSEQ-T10x4RS is not a single instrument but is instead a cluster of four large sequencing machines. Although pictures of the DNBSEQ-T10x4RS instrument (or rather instruments) may have been omitted from RX4004, the document refers to "set" of DNBSEQ-T10x4RS (RX4004 at 1), and the fact that the model name contains "x4" further confirms that the DNBSEQ-T10x4RS is a package configuration of four instrument units, with four times the footprint (and possibly four times the price). Evaluating a four-instrument BGI installation against a single Illumina NovaSeq or Lightning instrument is not an apples-to-apples comparison. Therefore, this Court should disregard the proposed finding.

591. BGI's DNBSEQ sequencer's reported accuracy is comparable to Illumina's sequencers, and guarantees more than 80% of bases with a quality score greater than Q30—which is over 99.9% accurate. (RX3465 (MGI Tech); RX3067 (BGI).)

Response to Finding No. 591

Complaint Counsel objects to the proposed finding because it misattributes the source of a document and is unsupported, misleading, and against the weight of the evidence.

Complaint Counsel objects to the attribution of RX3067 to BGI as the source of the document, in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3. RX3067 appears to be a document from BGI, but it is unclear how, when, and from where Respondents obtained the document. (RX3067.) Given the inherent unreliable nature of this document, it has little to no probative value. (*See* Rule 4.43(b)). Respondents elected not to pursue any form of discovery from BGI in this action, likely because they know such evidence would not support their contention that BGI will be a feasible alternative NGS platform available to MCED developers in the United States any time in the foreseeable future. Indeed, Illumina has obtained discovery from BGI on this very topic in another proceeding, prompting the court to

conclude that BGI's CoolMPS technology is "neither mature nor commercially viable." *Illumina, Inc. v. BGI Genomics Co., Ltd.*, No. 3:19-cv-03770, 2022 WL 899421, at *25 (N.D. Cal. Mar. 27, 2022) (noting the deposition testimony of Jian Wang, BGI's Chairman: "Q: Do you consider the CoolMPS sequencers to be an important product line of BGI? A: No.").

The proposed finding is unsupported because neither of the sources cited provides that BGI's DNBSEQ sequencers' reported accuracy is comparable to Illumina's sequencers. In fact, neither source cited even mentions Illumina sequencers (RX3067 only mentions Illumina microarray products).

The proposed finding is misleading because RX3067 describes a BGI sequencing *service* offering, not BGI instruments sold to and operated by individual laboratories, and it is unclear to what extent, if any, the information applies to BGI instruments that were ever sold or offered for sale to independent laboratories. (RX3067.)

The proposed finding is against the weight of substantial evidence showing that BGI sequencers do not perform similarly to Illumina sequencers. [redacted] Therefore, this Court should disregard the proposed finding.

592. BGI's highest throughput instrument has a higher reported throughput than the highest performance instrument and flow cell currently offered by Illumina, the NovaSeq 6000 with the S4 flow cell (up to 6 Tb/run), [redacted] (*Compare* RX4004 (MGI Tech) at 1–2 *with* RX3357 (Illumina) at 7; [redacted]

Response to Finding No. 592

[redacted]

[redacted]

593. BGI/MGI offers the MGIEasy Whole Genome Bisulfite Sequencing Library Prep Kit for DNA methylation analysis using bisulfite conversion. (RX3465 (MGI Tech).) BGI also provide whole-genome bisulfite sequencing and target region bisulfite sequencing for either genome-wide DNA methylations profiling or DNA methylations profiling in specific regions of interest. (RX3070 (BGI).)

Response to Finding No. 593

Complaint Counsel objects to the proposed finding because it is unsupported and misleading.

The proposed finding is unsupported because the first source cited (RX3465) does not reference an "MGIEasy Whole Genome Bisulfite Sequencing Library Prep Kit" or contain any information whatsoever about bisulfite sequencing or methylation analysis. The proposed finding is unsupported because the second source cited (RX3070) only discusses "whole genome" bisulfite sequencing but makes no mention of "target region" bisulfite sequencing.

The proposed finding is misleading because RX3070 describes a BGI sequencing *service* offering, not BGI instruments sold to and operated by individual laboratories, and it is unclear to what extent, if any, the information applies to BGI instruments that were ever sold or offered for sale to independent laboratories. The proposed finding is also confusing because RX3070 provides general background information about whole genome bisulfite sequencing but does not say that BGI offers bisulfite sequencing. Therefore, this Court should disregard the proposed finding.

593.1 BGI also offers ChIP-Seq services to analyze protein interaction with DNA using its DNBSEQ sequencers. (RX3066 (BGI).) Sequencers capable of sequencing DNA that has been prepared using chromatin immunoprecipitation (ChIP) are also capable of sequencing DNA that has been prepared using methylated-DNA immunoprecipitation (MeDIP).

Response to Finding No. 593.1

Complaint Counsel objects to the proposed finding because it is misleading and unsupported.

The proposed finding is misleading because RX3066 describes a BGI sequencing *service* offering, not BGI instruments sold to and operated by individual laboratories, and it is unclear to what extent, if any, the information applies to BGI instruments that were ever sold or offered for sale to independent laboratories.

The proposed finding is unsupported because it does not cite to any evidence of record for the point that sequencers capable of sequencing DNA that has been prepared using chromatin immunoprecipitation (ChIP) are also capable of sequencing DNA that has been prepared using methylated-DNA immunoprecipitation (nor does RX3066 support the point). Therefore, this Court should disregard the proposed finding.

594. BGI's reported sequencing costs for its DNBSEQ sequencers are lower than those for Illumina's NovaSeq instrument.

Response to Finding No. 594

Complaint Counsel object to the proposed finding because it is unsupported, as it does not cite to any evidence of record. Therefore, this Court should disregard the proposed finding.

594.1 For example, BGI advertises Whole Genome Sequencing service for $400 in the U.S. and worldwide on the DNBSEQ platforms, at about $4 per Gb. (RX3068 (BGI); RX3071 (BGI).)

Response to Finding No. 594.1

Complaint Counsel objects to the proposed finding because it is misleading in that the

sources cited (RX3068 and RX3071) describe a BGI sequencing *service* offering, not BGI instruments sold to and operated by individual customers or laboratories at their own sites, which is what this case is about. Moreover, the service described (whole genome sequencing) is not the application at issue in this case (sequencing of cfDNA for MCED testing). There is no basis for applying information contained in RX3068 or RX3071 about the price of BGI's irrelevant in-house service offering to imagined commercial sales of unidentified BGI instruments and consumables for an altogether different application. Therefore, this Court should disregard the proposed finding.

> 594.2 BGI also announced that its DNBSEQ-T10×4RS sequencers can generate $100 genomes, making it per Gb cost only $1.00. (RX4004 (MGI); *see also* deSouza (Illumina) Tr. 2331 ("Last year, BGI announced its hundred-dollar genome and has talked about its T-10 being ready to be deployed around the world").

Response to Finding No. 594.2

Complaint Counsel objects to the proposed finding because it misattributes the source of a document and is unsupported and misleading.

Complaint Counsel objects to the attribution of RX4004 to MGI Tech. (an affiliate of BGI) as the source of the document, in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3. RX4004 appears to be a press release from MGI, but it is printed from a third-party website, and it is unclear whether it has been translated or whether any pictures, including potentially relevant pictures of the DNBSEQ-T10x4RS instrument discussed in the press release, have been omitted (the first page of the exhibit shows a broken image icon). Given the inherent unreliable nature of this document, it has little to no probative value. (*See* Rule 4.43(b)). Respondents elected not to pursue any form of discovery from BGI in this action, likely because they know such evidence would not support their contention that BGI will be a feasible alternative NGS platform available to MCED developers in the United States any time in

the foreseeable future. Indeed, Illumina has obtained discovery from BGI on this very topic in another proceeding, prompting the court to conclude that BGI's CoolMPS technology is "neither mature nor commercially viable." *Illumina, Inc. v. BGI Genomics Co., Ltd.*, No. 3:19-cv-03770, 2022 WL 899421, at *25 (N.D. Cal. Mar. 27, 2022) (noting the deposition testimony of Jian Wang, BGI's Chairman: "Q: Do you consider the CoolMPS sequencers to be an important product line of BGI? A: No.").

The proposed finding is unsupported because the source cited (RX4004) does not say that the DNBSEQ-T10x4RS sequencers can "generate $100 genomes" or that the per gigabase cost is only $1, nor does it contain any figures whatsoever relating to the cost of sequencing.

The proposed finding is misleading because it does not clarify that the DNBSEQ-T10x4RS is not a single instrument but is instead a cluster of four large sequencing machines. Although pictures of the DNBSEQ-T10x4RS instrument (or rather instruments) may have been omitted from RX4004, the document refers to "set" of DNBSEQ-T10x4RS (RX4004 at 1), and the fact that the model name contains "x4" further confirms that the DNBSEQ-T10x4RS is a package configuration of four instrument units, with four times the footprint (and possibly four times the price). Evaluating a four-instrument BGI installation against a single Illumina NovaSeq or Lightning instrument is not an apples-to-apples comparison. Therefore, this Court should disregard the proposed finding.

4. **GenapSys**

596. GenapSys, Inc., based in Redwood City, California, launched its GenapSys Sequencer in 2019. (RX3402 (GenomeWeb).) This new NGS sequencing platform uses semiconductors to measure the minute impedance change, i.e., the change in the effective resistance of the reaction solution, resulting from the incorporation reaction. (RX3257 (GenapSys).) GenapSys's technology also relies on a sequencing-by-synthesis approach. (RX3869 (Cote Expert Report) ¶ 290.)

Response to Finding No. 596

Complaint Counsel objects to the proposed finding because it misattributes the source of a document, relies on hearsay evidence, and improperly cites expert testimony.

Complaint Counsel objects to the attribution of RX3257 (which Respondents purportedly captured from Genapsys's website at a now-broken URL) to Genapsys as the source of the document, in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3. The document constitutes hearsay. The proposed finding also cites RX3402, a stale GenomeWeb article from 2019 that also constitutes hearsay. Given the inherent unreliable nature of these documents, they have little to no probative value. (*See* Rule 4.43(b)). Respondents elected not to pursue any form of discovery from Genapsys in this action, likely because they know such evidence would not support their contention that Genapsys is a feasible alternative NGS platform available for MCED developers.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote to support facts, in contravention of this Court's Order. This Court should disregard this evidence and the proposed finding.

597. GenapSys' NGS sequencer has comparably low costs for both the equipment and per run cost. Reports suggest that the list price of the GenapSys Sequencer is only $9,900 and a

sequencing kit for a 16 MM chip single run costs $299. (RX3262 (GenomeWeb).) GenapSys announced in January 2021 that the cost on its 144 MM chip to be shipped this year would be about $27 per Gb. (RX3732 (Vilella).)

Response to Finding No. 597

Complaint Counsel objects to the proposed finding because it is misleading, unreliable, unsupported, against the weight of the evidence, and vague.

The proposed finding is misleading because it suggests that Genapsys sells a 144 MM sequencing chip but cites no reliable source for that claim. First, it cites a stale hearsay article from November 2019 reporting that "the 144 million sensor chip will be available next year" (i.e., 2020). (RX3262 at 1). Then it cites RX3732, which is even less reliable hearsay—a Twitter feed from a person named "Albert Vilella" of unknown affiliation or credentials, who did not testify in this proceeding—claiming in January 2021 that "[t]hey now are aiming at 2021 to ship two new chips: 50MM read chip and 144MM sensor chip (not sure what the difference is between read/sensor)." (RX3732 at 1). But the proposed finding cites no evidence that Genapsys ever actually commercially shipped a 144 MM chip, as opposed to merely announcing plans to do so (and then failing to meet the announced target). Indeed, Respondents elected not to pursue any form of discovery from Genapsys in this action, likely because they know such evidence would not support their contention that Genapsys is a feasible alternative NGS platform available for MCED developers.

The proposed finding is misleading and against the weight of the evidence to the extent it suggests that any purported Genapsys sequencer is a viable platform for MCED testing. The proposed finding is against the weight of the evidence from [redacted]

[redacted]

The proposed finding is vague because it claims "GenapSys' NGS sequencer has comparably low costs for both the equipment and per run cost" but does not explain what it is being compared to. Therefore, this Court should disregard the proposed finding.

5. **Oxford Nanopore**

598. Oxford Nanopore Technology ("ONT") is a spin-out from the University of Oxford that launched in 2005. (RX3538 (ONT) at 1–3.) ONT's nanopore sequencing technology measures the minute change in electrical conductance across biological nanopores when DNA molecules thread through those nanopores under the control of enzyme motors, using nanopore sensors with the ability to differentiate nucleotides. (RX3538 (ONT); RX3166 (Deamer et al., 2016).)

Response to Finding No. 598

Complaint Counsel objects to the proposed finding because it misattributes the source of documents.

Complaint Counsel objects to the attribution of RX3538, which Respondents purportedly captured from ONT's website—to ONT as the source of the document, in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3. Respondents elected not to pursue any form of discovery from ONT in this action, likely because they know such evidence would not support their contention that ONT is a feasible alternative NGS platform available for MCED developers.

Complaint Counsel also objects to the attribution of RX3166—which appears to be a non-final author manuscript by Deamer et al., and which Respondents to not explain how they obtained—to ONT as the source of the document, in contravention of this Court's Order. *See*

Order on Post-Trial Findings at 3. Respondents elected not to pursue any form of discovery from ONT in this action, likely because they know such evidence would not support their contention that ONT is a feasible alternative NGS platform available for MCED developers. Therefore, this Court should disregard the proposed finding.

599. ONT currently makes four NGS sequencers, with one more in development. The below chart shows each of the ONT instruments and their current throughput:

Table 6

Instrument(s)	Throughput	Read Length	Run Time
Flongle	Simultaneous sequencing of up to 126 DNA strands	No limit to read length; highest to date is 4 million. Total throughput per run is up to ~ 2 Gb per run	1 min–16 hours
MinION	Simultaneous sequencing of up to 512 DNA strands	No limit to read length; highest to date is 4 million. Total throughput per run is ~ 10 to 20 Gb, up to 42 Gb	1 min–72 hours
GridION	Simultaneous sequencing of up to 2,560 DNA strands	No limit to read length; highest to date is 4 million. Total throughput per run is up to 210 Gb	1 min–72 hours
PromethION	Simultaneous sequencing of up to 128,400 DNA strands	No limit to read length; highest to date is 4 million. Total throughput per run is up to 10,000 Gb (10 Tb)	1 min–72 hours
Plongle (in development)	Parallel sequencing with 96 flow cells	No limit to read length; highest to date is 4 million	1 min–72 hours

(RX3913 (ONT,) at 1–5; RX3543 (ONT) at 1; RX3536 (ONT); RX3542 (ONT); RX3869 (Cote Expert Report) ¶ 293.)

Response to Finding No. 599

Complaint Counsel objects to the proposed finding because it misattributes the source of documents, improperly cites expert testimony, and is misleading.

Complaint Counsel objects to the attribution of RX3913, RX3543, RX3536, and RX3542—documents which Respondents purportedly captured from ONT's website—to ONT as the source of the document, in contravention of this Court's Order. *See* Order on Post-Trial

Findings at 3. Two of the documents (RX3913 and RX3543) contain content that is different than the content currently posted at the URL listed in these exhibits. These documents constitute hearsay. Given the inherent unreliable nature of these documents, they have little to no probative value. (*See* Rule 4.43(b)). Respondents elected not to pursue any form of discovery from ONT in this action, likely because they know such evidence would not support their contention that ONT is a feasible alternative NGS platform available for MCED developers.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote to support facts ([redacted]), in contravention of this Court's Order. This Court should disregard this evidence.

The proposed finding is vague because it does not make clear that the figures provided in the "Throughput" column refer to the number of fragments that can be sequenced simultaneously per run of the instrument, not per flow cell within each run.

The proposed finding is confusing and misleading because, underneath the "Read Length" column, it also provides the total output of each instrument run in bases (gigabases or terabases). The total output in bases of a sequencer per run of the instrument (or per period of time) is an irrelevant metric for the application of MCED tests. [redacted] Therefore, this Court should disregard the proposed finding.

600. Core components of ONT's long-read sequencing technology as well as other recent innovations have made its platform more suitable for multi-cancer screening. (*See* RX3869 (Cote Expert Report) ¶¶ 293, 295–98.)

Response to Finding No. 600

Complaint Counsel objects to the proposed finding because it improperly cites expert testimony, Dr. Cote is not qualified to provide expert testimony on this subject, Dr. Cote's opinion is not reliable, Dr. Cote is not a credible witness, and it is against the weight of the evidence.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote to support the purported fact [redacted], in contravention of this Court's Order. This Court should disregard this evidence.

Dr. Cote is not qualified to provide expert opinion testimony about which NGS platforms are viable for MCED testing, because he has never operated an NGS instrument and has no publications related to NGS, among other reasons. (*See* Response to RPFF ¶ 1964, below (examining Dr. Cote's lack of qualifications on subject of which NGS platforms are viable for MCED testing)). This Court should not accord Dr. Cote's opinion any weight.

In addition to Dr. Cote being unqualified, his opinions about which NGS platforms are viable for MCED testing is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community.

Dr. Cote is not a credible witness, so his opinion does not deserve any weight. Dr. Cote offered opinion testimony in this matter that spans multiple disparate subjects and exceeds his

expertise; [redacted]. (*See* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects)).

[redacted]. (*See* CCFF ¶¶ 1346-69).

[redacted] (*See* CCFF ¶¶ 1370-98). Therefore, this Court should disregard the proposed finding.

> 600.1 Because it does not require PCR amplification, ONT's long-read sequencing eliminates amplification bias while preserving base modifications, making it ideal for epigenomic analysis such as methylation profiling. (RX3439 (Mantere et al., 2019) at 2; *see also* RX3236 (Folkard et al., Methylation with Oxford Nanopore Technologies Video Seminar).) ONT recently released a Cas9 targeted nanopore sequencing kit, which enables high depth sequencing and retains methylation patterns and other base modifications. (RX3537 (ONT).)

Response to Finding No. 600.1

Complaint Counsel objects to the proposed finding because it is misleading, improperly cites a third-party video that is not in evidence, and is vague.

The proposed finding is misleading to the extent that it suggests ONT long-read sequencing can be used for MCED testing. The Matere et al. paper (RX3439) discusses only applications that involve sequencing of genomic DNA templates for which long read lengths are an advantage; it contains no mention of MCED testing or any liquid biopsy application that involves sequencing cell-free DNA templates. Similarly, the description of the ONT Cas9 sequencing kit contained in RX3537 (which purports to be a printout from ONT's website)

simply says nothing whatsoever about MCED testing or any liquid biopsy application.

RX3236 is a one-page printout that purports to be printed from an ONT web page at which a video is posted. The video posted at the URL listed in this document has not been admitted into evidence, and therefore Respondents may not rely on it for evidentiary support. Moreover, Respondents provide no specific citation, substantive point, quotation, timestamp or other reference by which this Court could even locate any content in this video that purportedly This Court's Post-Trial Order explicitly requires that all facts be supported by "specific references to the evidentiary record." (*See* Order on Post-Trial Findings at 2). This citation does not comply with that order. This Court should disregard RX3236, as well as the video posted on an external website that is not in evidence.

The proposed finding is vague because it does not define "high depth sequencing." Therefore, this Court should disregard the proposed finding.

> 600.2 ONT's nanopore sequencing technology is capable of directly detecting methylation and other epigenomic markers on DNA or RNA, without the bisulfite conversion step used by other sequencing technologies (*e.g.*, for Illumina's sequencing technology) that can cause sample degradation, and that can complicate data analysis. (RX3869 (Cote Expert Report) ¶ 295.)

Response to Finding No. 600.2

Complaint Counsel objects to the proposed finding because it improperly cites expert testimony and is misleading, Dr. Cote is not qualified to provide expert opinion testimony on this subject, Dr. Cote is not a credible witness, and Dr. Cote's opinion is not reliable.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here, Respondents cite Dr. Cote [redacted], in contravention of this Court's Order. This Court should disregard this evidence.

The proposed finding is misleading to the extent that it suggests ONT long-read sequencing can be used for MCED testing. The proposed finding is against the weight of significant evidence showing that extremely inefficient long-read NGS platforms such as ONT's platform are not a viable option for MCED testing. [redacted] (*See* CCFF ¶¶ 1346-69). [redacted] (*See* CCFF ¶¶ 1370-98).

Dr. Cote is not qualified to provide expert opinion testimony about which NGS platforms are viable for MCED testing, because he has never operated an NGS instrument and has no publications related to NGS, among other reasons. (*See* Response to RPFF ¶ 1964, below (examining Dr. Cote's lack of qualifications on subject of which NGS platforms are viable for MCED testing)). This Court should not accord Dr. Cote's opinion any weight.

In addition to Dr. Cote being unqualified, his opinions about which NGS platforms are viable for MCED testing is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community.

Dr. Cote is not a credible witness, so his opinion does not deserve any weight. Dr. Cote offered opinion testimony in this matter that spans multiple disparate subjects and exceeds his expertise; [redacted] (*See* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects)). Therefore, this Court should disregard the proposed finding.

600.3 Using ONT's nanopore sequencing, researchers have directly identified epigenomic modifications at nucleotide resolution, including DNA methylation, with detection of other epigenomic modifications possible through training base-calling algorithms. (RX3539 (ONT).)

Response to Finding No. 600.3

Complaint Counsel objects to the proposed finding because it misattributes the source of documents and is misleading.

Complaint Counsel objects to the attribution of RX3539—a document which Respondents purportedly captured from ONT's website—to ONT as the source of the document, in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3. This document constitutes hearsay. Given the inherent unreliable nature of these documents, they have little to no probative value. (*See* Rule 4.43(b)). Respondents elected not to pursue any form of discovery from ONT in this action, likely because they know such evidence would not support their contention that ONT is a feasible alternative NGS platform available for MCED developers.

The proposed finding is misleading to the extent that it suggests ONT long-read sequencing can be used for MCED testing. RX3539 does not discuss MCED testing or even liquid biopsy applications. The proposed finding is against the weight of significant evidence showing that extremely inefficient long-read NGS platforms such as ONT's platform are not a viable option for MCED testing. [redacted] (*See* CCFF ¶¶ 1346-69). [redacted]. (*See* CCFF ¶¶ 1370-98). Therefore, this Court should disregard the proposed finding.

600.4 The use of ONT's nanopore direct sequencing also means that DNA methylation and other base modifications data is captured together with sequence data and is available for analysis at any future timepoint. (RX3539 (ONT).)

Response to Finding No. 600.4

Complaint Counsel objects to the proposed finding because it misattributes the source of documents and is misleading.

Complaint Counsel objects to the attribution of RX3539—a document which Respondents purportedly captured from ONT's website—to ONT as the source of the document, in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3. This document constitutes hearsay. Given the inherent unreliable nature of these documents, they have little to no probative value. (*See* Rule 4.43(b)). Respondents elected not to pursue any form of discovery from ONT in this action, likely because they know such evidence would not support their contention that ONT is a feasible alternative NGS platform available for MCED developers.

The proposed finding is misleading to the extent that it suggests ONT long-read sequencing can be used for MCED testing. RX3539 does not discuss MCED testing or even liquid biopsy applications. The proposed finding is against the weight of significant evidence showing that extremely inefficient long-read NGS platforms such as ONT's platform are not a viable option for MCED testing. [redacted]. (*See* CCFF ¶¶ 1346-69). [redacted] (*See* CCFF ¶¶ 1370-98). Therefore, this Court should disregard the proposed finding.

> 600.5 ONT's MinION nanopore sequencer has also been used by researchers for ChIP-Seq to study protein-DNA binding activity and strength. (*See* RX3077 (Borlin et al., 2020).) Researchers are also improving the Rapid Analysis of ChIP-Seq data (RACS) software for the analysis of ONT's nanopore sequencing data. (*See* RX3620 (Saettone et al., 2019).)

Response to Finding No. 600.5

Complaint Counsel objects to the proposed finding because it is misleading to the extent that it suggests ONT long-read sequencing can be used for MCED testing. RX3077 and RX3620 do not discuss MCED testing or even liquid biopsy applications. The proposed finding is against

the weight of significant evidence showing that extremely inefficient long-read NGS platforms such as ONT's platform are not a viable option for MCED testing. [redacted]. (*See* CCFF ¶¶ 1346-69). [redacted] (*See* CCFF ¶¶ 1370-98). Therefore, this Court should disregard the proposed finding.

601. While ONT has historically focused on long-read sequencing, recently published research has demonstrated ONT's capability to perform short-read sequencing. (PFF ¶¶ 601.1–601.4.) Such research suggests that ONT's nanopore sequencers are "a reliable alternative to Illumina sequencing, with the advantages of minute instrumentation costs and extremely short analysis time". (RX3446 (Martignano et al., 2021) at 1.)

Response to Finding No. 601

Complaint Counsel objects to the proposed finding because it is misleading, unsupported, and against the weight of the evidence.

The proposed finding is misleading because it is taken, verbatim, from Dr. Cote's report (RX3869 (Cote Report) ¶ 297) but is not attributed to him. This is no doubt because Dr. Cote made the highly misleading and unsupported claim during trial that, using the technique of ligating short DNA template molecules together into a longer molecule, "instead of many millions of reads that need to be done, only one read needs to be done in the case of the ONT platform." (Cote Tr. 3755). However, none of the Martignano et al. paper (RX3446) cited in RPFF ¶ 601 and 601.4, the Wei et al. paper (RX3737) cited in RPFF ¶ 601.1, the Wilson et al. paper (RX3744) cited in RPFF ¶ 601.2, or the Marcozzi et al. paper (RX3441) cited in RPFF ¶ 601.3, below, demonstrated or made any claim of concatenating anything approaching "millions" of short molecules together, even as a one-time proof of concept experiment (never mind an actual robust and reliable protocol that could meet the extreme performance demands of clinical MCED testing). Moreover, Respondents did not obtain any documents or testimony from ONT or the study authors. These articles constitute out-of-court statements being offered for the truth

of the matter asserted and thus constitute unreliable hearsay evidence. As such, the Court ought not give this evidence any weight.

[redacted]

[redacted]

The proposed finding is also misleading because it claims that the Martignano et al. paper cited (RX3446) was "recently published," when in fact it was published back in February 2021, well before discovery and trial in this matter. The other papers cited in RPFF ¶¶ 601.4-601.4 were published as far back as 2016 (*see* RX3737, Wei et al, 2016). But Respondents' counsel did not ask any MCED witness a single question about any of these papers that supposedly hold the key to making long-read sequencing platforms viable for MCED testing.

The proposed finding is against the weight of significant evidence showing that extremely inefficient long-read NGS platforms such as ONT's platform are not a viable option for MCED testing[redacted]. (*See* CCFF ¶¶ 1346-69).

[redacted]. (*See* CCFF ¶¶ 1370-98). Therefore, this Court should disregard the proposed finding.

> 601.1 For example, in 2016, researchers from the Albert Einstein College of Medicine developed a method that enabled rapid real-time sequencing of short DNA fragments using the MinION nanopore sequencer in a test for aneuploidy. (RX3737 (Wei & Williams 2016).)

Response to Finding No. 601.1

Complaint Counsel objects to the proposed finding because it is misleading, unsupported, and against the weight of the evidence. Complaint Counsel's response to proposed sub-findings 601.1-601.4 is set forth in response to proposed finding 601, above. (*See* Response to RPFF ¶

601, above). Therefore, this Court should disregard the proposed finding.

601.2 In 2019, researchers from the Stanford University developed a rolling-circle amplification method to produce long stretches of concatemeric repeats of short DNA sequences <100 bp from cfDNA that is sensitive enough to achieve SNV (single-nucleotide variants) discrimination in mixtures of sequences and enables quantitative detection of specific variants present at ratios of <10% using ONT's MinION nanopore sequencer. (RX3744 (Wilson et al., 2019).)

Response to Finding No. 601.2

Complaint Counsel objects to the proposed finding because it is misleading, unsupported, and against the weight of the evidence. Complaint Counsel's response to proposed sub-findings 601.1-601.4 is set forth in response to proposed finding 601, above. (*See* Response to RPFF ¶ 601, above). Therefore, this Court should disregard the proposed finding.

601.3 In 2020, researchers from Utrecht University of the Netherlands developed a CyclomicsSeq method that uses similar rolling-circle amplification to accurately detect lowly abundant (0.02%) circulating tumor DNA (ctDNA) from liquid biopsies of patients with head-and-neck squamous cell carcinoma (HNSCC) using MinION nanopore sequencer. (RX3441 (Marcozzi A et al., 2020).)

Response to Finding No. 601.3

Complaint Counsel objects to the proposed finding because it is misleading, unsupported, and against the weight of the evidence. Complaint Counsel's response to proposed sub-findings 601.1-601.4 is set forth in response to proposed finding 601, above. (*See* Response to RPFF ¶ 601, above). Therefore, this Court should disregard the proposed finding.

601.4 In February 2021, researchers from Italy also showed successful use of low-coverage MinION nanopore sequencing for profiling of copy number variation from plasma cfDNA from liquid biopsies of lung cancer patients as a reliable alternative to Illumina sequencing. (RX3446 (Martignano et al., 2021).)

Response to Finding No. 601.4

Complaint Counsel objects to the proposed finding because it is misleading, unsupported, and against the weight of the evidence. Complaint Counsel's response to proposed sub-findings

601.1-601.4 is set forth in response to proposed finding 601, above. (*See* Response to RPFF ¶ 601, above). Therefore, this Court should disregard the proposed finding.

602. ONT has also announced its intent to support the liquid biopsy market. (RX3470 (Nanopore); RX3521 (NCM) at 50–52; RX3167 (Nanopore); RX3520 (NCM) at 6, 9–10).)

Response to Finding No. 602

Complaint Counsel objects to the proposed finding because it misattributes the source of documents and is vague, misleading, and unsupported.

Complaint Counsel objects to the attribution of RX3470, RX3521, RX3167, and RX3520 to ONT as the source of the documents, in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3. Two of the documents (RX3470 and RX3167) appear to be captures of pages on ONT's website where video is posted. Two of the documents (RX3521 and RX3520) appear to be transcriptions of the videos that Respondents purportedly had created. These documents constitute hearsay and are not reliable. ONT did not testify to explain their meaning or be tested on any statements contained within. Given the inherent unreliable nature of these documents, they have little to no probative value. (*See* Rule 4.43(b)). Respondents elected not to pursue any form of discovery from ONT in this action, likely because they know such evidence would not support their contention that ONT is a feasible alternative NGS platform available for MCED developers.

The proposed finding is vague because it does not explain what is meant by "support" or what is meant by "liquid biopsy," which encompasses research and clinical applications far beyond MCED testing.

The proposed finding is unsupported because the sources cited do not evidence that ONT ever expressed "intent to support the liquid biopsy market."

The proposed finding is misleading to the extent it suggests ONT long-read sequencing

can be used for MCED testing. The cited documents do not discuss MCED testing. The proposed finding is against the weight of significant evidence showing that extremely inefficient long-read NGS platforms such as ONT's platform are not a viable option for MCED testing. [redacted]. (*See* CCFF ¶¶ 1346-69). [redacted] (*See* CCFF ¶¶ 1370-98). Therefore, this Court should disregard the proposed finding.

603. The per gigabase sequencing costs for ONT's NGS sequencers are comparable to those for the highest throughout Illumina NGS sequencers. (PFF ¶¶ 603.1–603.3.)

Response to Finding No. 603

Complaint Counsel objects to the proposed finding because it is misleading in that it employs the metric of cost per gigabase, which is irrelevant when utilizing NGS for liquid biopsy applications such as MCED testing. For liquid biopsy applications, the cost per patient sample is driven by the cost per read (i.e., per fragment), not the cost per base. [redacted]

[redacted]

603.1 For example, the University of Wisconsin-Madison Biotechnology Center offers ONT nanopore sequencing at $730 for a single cell, $1250 for GridION and $2100 for a PromethION run. (RX3717, University of Wisconsin-Madison Biotechnology Center.)

Response to Finding No. 603.1

Complaint Counsel objects to the proposed finding because it is confusing, misleading, and based on unreliable hearsay.

The proposed finding is confusing because the previous proposed finding discussed "per gigabase" pricing, and now this proposed sub-finding purports to provide an "example," yet the example is about pricing per flow cell or per run, not per gigabase.

The proposed finding is misleading in that it employs the metric of cost per gigabase, which is irrelevant when utilizing NGS for liquid biopsy applications such as MCED testing. For liquid biopsy applications, the cost per patient sample is driven by the cost per read (i.e., per fragment), not the cost per base. [redacted] In contrast, none of Respondents' witnesses, including purported multi-subject expert Dr. Cote, explained how

sequencing cost "per gigabase" is relevant to MCED testing, nor walked this Court through any calculation of sequencing cost for Grail's test or any other test to illustrate how cost per gigabase is a supposedly useful metric to MCED testing.

RX3539 appears to be a document that Respondents purportedly captured from a third-party website. This document constitutes hearsay. Given its inherent unreliable nature, it has little to no probative value. (*See* Rule 4.43(b)). Respondents elected not to pursue any form of discovery from sequencing labs purportedly offering ONT sequencing, likely because they know such evidence would not support their contention that anyone in the real world is using ONT for MCED test development or any other clinical liquid biopsy application. Therefore, this Court should disregard the proposed finding.

> 603.2 A PromethION customer reported repeatedly achieving 220 Gb of sequencing data output per single $625 flow cell, making per Gb cost for the PromethION only $3/Gb. (RX3698 (Amadeus Capital).)

Response to Finding No. 603.2

Complaint Counsel objects to the proposed finding because it relies on double hearsay and is misleading.

RX3698 appears to be a story that Respondents purportedly captured from the website of a company named Amadeus Capital that did not appear in this matter. The story states that "a PromethION customer reported" achieving 220 Gb of data. This constitutes double hearsay. Given its inherent unreliable nature, it has little to no probative value. (*See* Rule 4.43(b)). This Court should disregard this evidence.

The proposed finding is misleading in that it employs the metric of cost per gigabase, which is irrelevant when utilizing NGS for liquid biopsy applications such as MCED testing. For liquid biopsy applications, the cost per patient sample is driven by the cost per read (i.e., per fragment), not the cost per base. [redacted]

[redacted] In contrast, none of Respondents' witnesses, including purported multi-subject expert Dr. Cote, explained how sequencing cost "per gigabase" is relevant to MCED testing, nor walked this Court through any calculation of sequencing cost for Grail's test or any other test to illustrate how cost per gigabase is a supposedly useful metric to MCED testing. Therefore, this Court should disregard the proposed finding.

> 603.3 ONT states that its PromethION can achieve best in field yield per flow cell of 254 Gb at $625 flow cell, making best per Gb cost for the PromethION only $2.55. (RX3543 (ONT) (showing $625 per flow cell at 245 Gb).)

Response to Finding No. 603.3

Complaint Counsel objects to the attribution of RX3543—a document which Respondents purportedly captured from ONT's website—to ONT as the source of the document, in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3. Respondents elected not to pursue any form of discovery from ONT in this action, likely because they know such evidence would not support their contention that ONT is a feasible alternative NGS platform available for MCED developers.

The proposed finding is vague because it does not explain what is meant by "best in field."

The proposed finding is misleading in that it employs the metric of cost per gigabase, which is irrelevant when utilizing NGS for liquid biopsy applications such as MCED testing. For liquid biopsy applications, the cost per patient sample is driven by the cost per read (i.e., per fragment), not the cost per base. [redacted] In contrast, none of Respondents' witnesses, including purported multi-subject expert Dr. Cote, explained how sequencing cost "per gigabase" is relevant to MCED testing, nor walked this Court through any calculation of sequencing cost for Grail's test or any other test to illustrate how cost per gigabase is a supposedly useful metric to MCED testing. Therefore, this Court should disregard the proposed finding.

604. With regard to accuracy, ONT has announced that its single-molecule modal accuracy is now >99.3% (Q20) using its "Q20+" chemistry, and also developed a new approach termed "Duplex" sequencing, which enables the sequencing of both template and complementary strands and accuracy "trending towards 99.9% (Q30)". (RX3541 (ONT) at 1; RX3535 (ONT) at 1.)

Response to Finding No. 604

Complaint Counsel objects to the proposed finding because it misattributes the source of documents and is vague and misleading.

Complaint Counsel objects to the attribution of RX3541 and RX3535—documents which

Respondents purportedly captured from ONT's website—to ONT as the source of the documents, in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3. Respondents elected not to pursue any form of discovery from ONT in this action, likely because they know such evidence would not support their contention that ONT is a feasible alternative NGS platform available for MCED developers.

The proposed finding is vague because it does not specify what percentage of bases ONT even claims will score above Q20 accuracy. Providing a Q score without specifying the percentage of bases sequenced that achieve that Q score is a meaningless statistic. For example, "Illumina NGS sequencers are about 99.9% accurate (>87% of bases >Q30) in calling the correct base from the DNA sequence" (*see* RPFF 576, above), placing Illumina's accuracy far above ONT's.

The proposed finding is misleading to the extent it suggests that ONT's accuracy level is sufficient for MCED testing. [redacted] (*See* CCFF ¶¶ 1370-98). For example, [redacted] Therefore, this Court should disregard the proposed finding.

> 604.1 In addition, methods have been developed to obtain consensus sequences from homogenous DNA samples by genome assembly, resulting in accuracies of more than 99.999% (Q50). (RX3541 (ONT) at 1; RX3535 (ONT); RX3536 (ONT).)

Response to Finding No. 604.1

Complaint Counsel objects to the proposed finding because it misattributes the source of documents and is vague, unsupported, confusing, and misleading.

Complaint Counsel objects to the attribution of RX3541, RX3535, and RX3536—

documents which Respondents purportedly captured from ONT's website—to ONT as the source of the document, in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3. Respondents elected not to pursue any form of discovery from ONT in this action, likely because they know such evidence would not support their contention that ONT is a feasible alternative NGS platform available for MCED developers.

The proposed finding is vague because it does not explain what is meant by "methods … to obtain consensus sequences from homogenous DNA samples by genome assembly."

The proposed finding is unsupported because none of the sources cited discuss "homogenous DNA samples" or "accuracies of more than 99.999% (Q50)" or any similar concept.

The proposed finding is confusing because it does not even purport to have anything whatsoever to do with MCED testing.

The proposed finding is also misleading to the extent it suggests that ONT's accuracy level is sufficient for MCED testing. [redacted]. (*See* CCFF ¶¶ 1370-98). For example, [redacted] Therefore, this Court should disregard the proposed finding.

B. New and Future Entrants

1. Singular Genomics

605. Singular Genomics was founded in 2016 and is headquartered in La Jolla, California. (PX8561 (Singular) at 15.) Singular has developed a sequencing-by-synthesis NGS platform comprising their NGS instrument, called the G4 Instrument, and associated consumable

kits, which they refer to collectively as the G4 Integrated Solution or the G4 System. (PX8561 (Singular) at 1–2.)

Response to Finding No. 605

[redacted]

[redacted]

606. Singular has also developed multiomics platform that incorporates NGS called the PX System. (PX8561 (Singular) at 1–2; PX7117 (Velarde (Singular) Dep. at 17).) Singular has completed pilot testing of its G4 System, involving their first external third-party evaluation, and is about to launch its early-access program. (PX7117 (Velarde (Singular) Dep. at 22–23).)

Response to Finding No. 606

[redacted]

[redacted] Singular warned its investors that "our limited operating history makes it difficult to evaluate our future prospects." (PX0068 at 023 (Singular Genomics S-1, May 2021)).

[redacted] If it cannot obtain additional funding, Singular warned investors that it may be required "to delay, scale back, or cease our product development or commercialization activities." (PX0068 at 035 (Singular Genomics S-1, May 2021)). Lastly, Singular expects to face "future litigation by third parties, including our competitors, who have patent and other intellectual property rights and may allege that our research and development activities, products, manufacturing methods, software and/or technologies infringe, misappropriate or otherwise violate their intellectual property rights." (PX0068 at 046 (Singular Genomics S-1, May 2021)**;** *see also* [redacted]

[redacted]

607. Singular commercially launched the the G4 NGS sequencer at the end of 2021 and will begin shipping the G4 NGS systems in the first half of 2022. (Velarde (Singular) Tr. 4515–16, 4522; *see also* PX8561 (Singular) at 1–2; PX7117 (Velarde (Singular) Dep. at 30–31).)

Response to Finding No. 607

Complaint Counsel objects to this proposed finding as confusing and misleading.

This proposed finding is confusing because it uses the term "commercially launched" to mean something other than "commercially launched." [redacted] At trial when Singular's Velarde was asked "[d]oes Singular have any products in development currently?" Velarde answered "Yes, we do. . . We have what we are referring to as the G4 sequencer and a PX system as well." (Velarde, Tr. 4513). Likewise, Velarde testified, "Yeah, so the G4 hasn't been launched, and we probably won't do that until the end of next year." (Velarde, Tr. 4531).

This proposed finding is misleading, as it implies that Singular Genomics' expectation that it will begin shipping units in the second quarter of 2022 signifies that it will achieve meaningful commercial sales in the near future. [redacted]

[redacted]

608. Singular's mission is to develop fast, powerful, efficient, flexible sequencing platforms to solve challenges, such as long analysis times, labor intensive protocols, sample batching requirements and high cost, that sequencing technologies face in oncology, including for early cancer detection. (PX8561 (Singular) at 92.)

Response to Finding No. 608

Complaint Counsel objects to this proposed finding, as it is misleading and misrepresents the document which Respondents cite. Singular's Form S-1 states that "Our mission is to accelerate genomics for the advancement of science and medicine." (PX8561 (Singular) at 095). At no point does Singular ever state that its mission is to develop sequencing platforms for early cancer detection. (PX8561 (Singular) at 095-96). Rather, Singular states that it is "focused on oncology where there is an increasing need for higher sensitivity technology such as rare variant detection in liquid biopsy." (PX8561 (Singular) at 095). [redacted]

Complaint Counsel further objects to the extent that Respondents claim that MCED test developers consider "sample batching requirements" to be a challenge, as not a single document from, nor any testimony by an MCED test developer supports that proposition. (*See generally* CCFF ¶¶ 886-1500). For the reasons stated, this Court should disregard the proposed finding.

609. The G4 System's performance characteristics claim to be comparable or better to Illumina's NextSeq and NovaSeq systems:

Response to Finding No. 609

Complaint Counsel object to the proposed finding because it is unsupported, as it does not cite to any evidence of record. Therefore, this Court should disregard the proposed finding.

609.1 Throughput of greater than 100 million paired-end reads per flow cell for four flow cells; targeted 330 million reads per flow cell at commercial launch for a total of 1,320 million reads. (Velarde (Singular) Tr. 4528–30; PX8561 (Singular) at 4–5; [redacted]

Response to Finding No. 609.1

[redacted]

[redacted]

[redacted]

609.2 Read lengths of 50 bases to 150 bases. (PX8561 (Singular) at 4–5; [redacted]

Response to Finding No. 609.2

[redacted]

[redacted]

609.3 Targeted 400 Gbs per sequencing run. (PX8561 (Singular) at 4–5; [redacted]

Response to Finding No. 609.3

[redacted]

[redacted]

[redacted]

[redacted]

609.4 High speed sequencing at 4.0 minute cycle time, with a targeted 2.5 minute cycle time that will generate a sequencing time of approximately 16 hours to complete a 2x150 base run. (PX8561 (Singular) at 4–5; [redacted]

Response to Finding No. 609.4

[redacted]

[redacted]

[redacted]

609.5 High accuracy of 99.7% on 150 base reads (>70% Q30 on base calls, with targeted >80% Q30 on base calls at launch); 99.99% (Q40) accuracy with the "HD-Seq" methodology. (PX8561 (Singular) at 4–5; PX7117 [redacted]

Response to Finding No. 609.5

[redacted]

[redacted]

609.6 Independent, flexible throughput that uses flow cells with independent lanes, enabling libraries to be kept separate in each lane while still retaining high throughput capacity. (PX8561 (Singular) at 4–5; [redacted]

Response to Finding No. 609.6

[redacted]

[redacted]

610. Singular expects that the G4 System will compete with Illumina for sales of sequencers and integrated systems to multicancer early detection test developers. [redacted] Tr. 4522, [redacted] *see also* PX8561 (Singular) at 8.)

Response to Finding No. 610

[redacted]

[redacted]

[redacted]

611. Singular is targeting clinical oncology applications for the G4 system; Singular is developing HD-Seq as one of the potential applications for MCED tests; Singular believes that in addition to faster turnaround time in clinical settings, Singular's HD sequencing process also

gives it an advantage; Singular expect to compete with Illumina for sales of sequencers and consumables to MCED test developers. (Velarde (Singular) Tr. 4522, [redacted]

Response to Finding No. 611

[redacted]

[redacted]

612.

Response to Finding No. 612

[redacted]

[redacted]

613. Singular does not believe that Illumina's reacquisition of GRAIL will have an effect on Singular's ability to innovate in the NGS space and Singular does not project that Illumina's reacquisition of GRAIL will slow down Singular's commercialization plans. (Velarde (Singular) Tr. 4534.)

Response to Finding No. 613

[redacted]

2. **Ultima Genomics**

614. Ultima Genomics, a biotechnology company based in Newark, California, is developing a low-cost alternative sequencing-by-synthesis platform to Illumina's highest throughput instrument and flow cell (NovaSeq 6000 with S4 flow cells) aimed at high-volume users. (PX7119 (Lauer (Ultima) Dep. at 34–36, 146–48).)

Response to Finding No. 614

Complaint Counsel objects to this proposed finding as vague and misleading.

3. **Roche**

624. Roche Diagnostics, parent of the company that previously brought to the market the first NGS sequencer—the 454 GS FLX Titanium sequencer—in 2005, acquired two NGS sequencer developers: Stratos Genomics that is developing a nanopore DNA sequencing technology utilizing Sequencing by Expansion (SBX), and Genia Technologies that is developing a single-molecule, nanopore technology. (RX3407 (Kircher et al., 2010); RX3615 (Roche); RX3614 (Roche).)

Response to Finding No. 624

Complaint Counsel objects that the proposed finding is not supported by the evidence that Respondents cite, misattributes the source of documents, and should be disregarded.

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted verbatim from Dr. Cote's report (RX3869 (Cote Report) ¶ 310), even though Respondents do not attribute it to Dr. Cote, and represents his opinion rather than market realities.

None of the documents that Respondents do cite makes any reference to a planned Roche sequencer, Stratos Genomics, or Genia Technologies. RX3407 (Kircher et al., 2010) is an academic paper from 2010 that discusses four then-contemporary sequencing instruments. It does not have any information about any planned Roche sequencing instrument. RX3614 appears to be a page Respondents captured from Roche's website announcing a partnership between Roche and Illumina, under which Illumina would grant Roche rights to develop and distribute in vitro diagnostic (IVD) tests on Illumina's NGS platform, although the document was not produced by Roche. Nothing in the document makes any mention of a planned Roche sequencing instrument; on the contrary, the only sequencing instrument mentioned in the document is Illumina's NextSeq550Dx. RX3615 appears to be another page Respondents captured from Roche's website describing a research-use only kit for analyzing tumor DNA from a tissue sample. Nothing in the document makes any mention of a planned Roche sequencing instrument; on the contrary, the only sequencing instrument mentioned in the document is Illumina's NextSeq 500. Because this finding is not supported by any of the documents that Respondents cite, this Court should disregard this finding.

625. Roche expects to bring to market an NGS nanopore sequencer by the 2024 time frame. (RX3614 (Roche).)

Response to Finding No. 625

Complaint Counsel objects to this proposed finding as misleading and unsupported.

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted verbatim from Dr. Cote's report (RX3869 (Cote Report) ¶ 310), even though Respondents do not attribute it to Dr. Cote, and represents his opinion rather than market realities. Respondents omit an important qualification from Dr. Cote's report: [redacted] Dr. Cote's musings on "the evidence" based on the limited evidence he personally reviewed are irrelevant and represent unreliable and improper expert opinion.

Respondents now attempt to substitute a new purported source for Dr. Cote's unsupported claim: RX3614, which Respondents appear to have printed from the Internet (Roche did not produce the document), and which has nothing to do with any nanopore sequencer. Because the cited source fails to support this proposed "finding" (penned by Dr. Cote), this Court should reject it.

[redacted]

5. **Omniome**

639. Omniome is a biotechnology company headquartered in San Diego, California that was founded in 2013. (PX7071 (Song, IHT at 13).) In July 2021, Pacific Biosciences of California ("PacBio") announced it had acquired Omniome for $800M. (RX3947 (Clinical OMICs).)

Response to Finding No. 639

Complaint Counsel objects to the attribution of RX3947 to Clinical OMICs, in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3. Respondents did not take discovery from any entity named "Clinical OMICs," and no entity by the name of "Clinical OMICs" produced any documents in this matter. RX3947 appears to be a document that Respondents purportedly captured from a third-party website. This document constitutes hearsay. Given its inherent unreliable nature, it has little to no probative value. (*See* Rule 4.43(b)). Complaint Counsel has no other specific response to the proposed finding.

639.1 Many of PacBio/Omniome's senior executives came from Illumina: PacBio CEO Christian Henry held several positions at Illumina, including former Chief Commercial Officer; Omniome President Richard Shen is a former Illumina Vice President of Oncology R&D. (RX3947 (Clinical OMICs) at 2.)

Response to Finding No. 639.1

Complaint Counsel objects to the attribution of RX3947 to Clinical OMICs, in

contravention of this Court's Order. *See* Order on Post-Trial Findings at 3. Respondents did not take discovery from any entity named "Clinical OMICs," and no entity by the name of "Clinical OMICs" produced any documents in this matter. RX3947 appears to be a document that Respondents purportedly captured from a third-party website. This document constitutes hearsay. Given its inherent unreliable nature, it has little to no probative value. (*See* Rule 4.43(b)).

The proposed finding is unsupported because it makes a claim regarding "many" executes but provides only two examples.

The proposed finding is misleading to the extent it suggests that merely by virtue of employing former Illumina executives, Omniome constitutes a competitor to Illumina or a feasible alternative NGS platform for MCED testing. For the reasons stated, this Court should disregard the proposed finding.

640. The combined PacBio and Omniome have said they would specifically target the cancer screening market, as well as other oncology applications. (RX3947 (Clinical OMICs) at 3.)

Response to Finding No. 640

Complaint Counsel objects to the attribution of RX3947 to Clinical OMICs, in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3. Respondents did not take discovery from any entity named "Clinical OMICs," and no entity by the name of "Clinical OMICs" produced any documents in this matter. RX3947 appears to be a document that Respondents purportedly captured from a third-party website. This document constitutes hearsay. Given its inherent unreliable nature, it has little to no probative value. (*See* Rule 4.43(b)).

The proposed finding is misleading and against the weight of the evidence to the extent it suggests that any planned Omniome sequencer is a viable platform for MCED testing. The

proposed finding is against the weight of the evidence from [redacted]

[redacted]

640.1 PacBio stated that it believes Omniome's data accuracy should help the combined company target oncology applications like cancer screening. RX3947 (Clinical OMICs) at 3.)

Response to Finding No. 640.1

Complaint Counsel objects to the attribution of RX3947 to Clinical OMICs, in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3. Respondents did not take discovery from any entity named "Clinical OMICs," and no entity by the name of "Clinical OMICs" produced any documents in this matter. RX3947 appears to be a document that Respondents purportedly captured from a third-party website. The author of this document claims to report what PacBio CEO Christian Henry purportedly said during an interview for which the author was not present. As such, this evidence constitutes double hearsay and has no probative value. (*See* Rule 4.43(b)). Moreover, the document does not even directly quote Mr. Henry, making it vague and misleading.

The proposed finding is misleading and against the weight of the evidence to the extent it suggests that any planned Omniome sequencer is a viable platform for MCED testing. The proposed finding is against the weight of the evidence from [redacted]

[redacted]

641. Omniome is developing an NGS sequencer using its sequencing-by-binding technology. (RX3533 (Omniome).)

Response to Finding No. 641

[redacted]

642. Omniome's sequencer will reportedly have comparable throughput and run times to Illumina's NexSeq sequencers, but with better accuracy—98%> Q50 to 99% Q70—10 to 100x better than the accuracy of Illumina's sequencers. (PX7096 (Song (Omniome) Dep. at 82, 100–01); [redacted]

Response to Finding No. 642

[redacted]

[redacted]

642.1 Omniome expects that, at launch, its NGS sequencer will have higher accuracy, longer sequence read and lower reagent costs than Illumina's sequencers. (PX7096 (Song (Omniome) Dep. at 43, 58, 68–72)**;** [redacted]

Response to Finding No. 642.1

[redacted]

[redacted]

[redacted]

642.2 In a recent earnings call, PacBio CEO Christian Henry claimed that PacBio/Omniome's "error rates are so low, we're more than 15-fold better than what other SBS players can do today". (RX4050 (PacBio) at 7.)

Response to Finding No. 642.2

Complaint Counsel objects to this proposed finding because it misattributes the source of documents, relies on hearsay evidence, is unreliable, and misleading.

Complaint Counsel objects to the attribution of RX4050, a document that appears to have been downloaded from a third-party website, to PacBio as the source of the document, in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3. Respondents elected

not to pursue any form of discovery from PacBio in this action, likely because they know such evidence would not support their contention that PacBio's subsidiary Omniome will be a feasible alternative NGS platform available to MCED developers in the United States any time in the foreseeable future.

Complaint Counsel further objects to RX4050, which appears to be a document that Respondents purportedly captured from a third-party website, as hearsay. Given its inherent unreliable nature, it has little to no probative value. (*See* Rule 4.43(b)).

Complaint Counsel further objects to the proposed finding because it is unreliable, as it consists of biased, unproven puffery, and lacks critical context such as cost and throughput specifications. The purported quote also does not explain whether the error rates being described are random or systematic, [redacted] Respondents seek to use this out of context hearsay to support their baseless contention, even though the very text that they quote makes no mention of MCED testing, or even liquid biopsy. The Court should assign no weight to this hearsay. For the reasons stated, this Court should disregard the proposed finding.

643. [redacted]; RX3189 (Encodia).) Omniome currently plans to launch its sequencer in early 2023. (PX7096 (Song (Omniome) Dep. at 28–29, 56).)

Response to Finding No. 643

[redacted]

[redacted]

[redacted]

644. Omniome expects its NGS platform will be used for "applications like cancer," and has general interest in oncology, including companies that are developing blood-based early cancer screening tests. (PX7096 (Song (Omniome) Dep. at 59–63, 66); [redacted]

Response to Finding No. 644

[redacted]

[redacted]

C. Switching Platforms

645. Switching between Illumina's platform and alternative platforms is feasible. (RX3869 (Cote Expert Report) ¶ 336.) To the extent a test developer believes this sort of switching is costly, there are alternative methods of switching between platforms, including concurrent development on multiple platforms. (RX3869 (Cote Expert Report) ¶ 336.)

Response to Finding No. 645

Complaint Counsel objects to the proposed finding because it is unsupported, vague, conclusory, and against the weight of the evidence, and it improperly cites expert testimony, Dr. Cote is not qualified to offer expert opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

[redacted]

The proposed finding is conclusory because it cites no support other than Dr. Cote who merely declares this sweeping generalization to be true.

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—a portion of it is merely copied and pasted verbatim from Dr. Cote's report and represents only his opinion rather than market realities.

The proposed finding is against the weight of substantial evidence showing that switching to another NGS platform would cause significant delays, require significant costs, and pose regulatory and financial risks for MCED test developers. (*See* CCFF ¶¶ 1768-1901). MCED tests are developed to run on a specific NGS platform. (*See* CCFF ¶¶ 1768-79). [redacted]

[redacted]

Illumina, Grail, and other NGS market participants recognize high switching costs. (*See* CCFF ¶¶ 1840-71). Switching NGS platforms is even more difficult once the MCED test has begun the FDA approval process. (*See* CCFF ¶¶ 1872-1901).

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only support for the purported facts in the proposed finding in contravention of this Court's Order. Dr. Cote has no personal knowledge or experience regarding switching an MCED test from one NGS platform to another (or developing an MCED test on any platform). This Court should disregard this evidence.

Moreover, Dr. Cote is not qualified to provide expert opinion testimony about switching an MCED test from one NGS platform to another because he has no experience developing MCED tests at all (*see* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on the subject of MCED development process and timeline)) or about which NGS platforms are viable for MCED testing because he has never operated an NGS instrument and has no publications related to NGS, among other reasons (*see* Response to RPFF ¶ 1964, below (examining Dr. Cote's lack of qualifications on the subject of which NGS platforms are viable for MCED testing)). Dr. Cote is also not credible (*see* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects). In addition, Dr. Cote's opinion about switching an MCED test from Illumina's platform to a purported alternative platform is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and

does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight. Therefore, this Court should disregard the proposed finding.

646. In fact, cancer screening developers will inevitably need to switch between different Illumina instruments in the course of developing their respective screening tests. (RX3869 (Cote Expert Report) ¶ 336.)

Response to Finding No. 646

Complaint Counsel objects to the proposed finding because it cites only unreliable self-serving testimony, it is misleading and against the weight of the evidence, and it improperly cites expert testimony, Dr. Cote is not qualified to offer expert opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

[redacted]

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted verbatim from Dr. Cote's report and represents only his opinion rather than market realities.

The proposed finding is against the weight of substantial evidence showing that switching to another NGS platform would cause significant delays, require significant costs, and pose regulatory and financial risks for MCED test developers. (*See* CCFF ¶¶ 1768-1901). MCED tests are developed to run on a specific NGS platform. (*See* CCFF ¶¶ 1768-79). [redacted]

[redacted]

Illumina, Grail, and other NGS market participants recognize high switching costs. (*See* CCFF ¶¶ 1840-71). Switching NGS platforms is even more difficult once the MCED test has begun the FDA approval process. (*See* CCFF ¶¶ 1872-1901).

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only support for the purported facts in the proposed finding in contravention of this Court's Order. Dr. Cote has no personal knowledge or experience regarding switching an MCED test from one NGS platform to another (or developing an MCED test on any platform). This Court should disregard this evidence.

Moreover, Dr. Cote is not qualified to provide expert opinion testimony about switching an MCED test from one NGS platform to another because he has no experience developing MCED tests at all (*see* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on the subject of MCED development process and timeline)) or about which NGS platforms are viable for MCED testing because he has never operated an NGS instrument and has no publications related to NGS, among other reasons (*see* Response to RPFF ¶ 1964, below (examining Dr. Cote's lack of qualifications on subject of which NGS platforms are viable for MCED testing)). Dr. Cote is also not credible (*see* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects). In addition, Dr. Cote's opinion about switching an MCED test from Illumina's platform to a purported alternative platform is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not

accord Dr. Cote's opinion any weight. Therefore, this Court should disregard the proposed finding.

646.1 Illumina's own model contemplates that a portion of test developers will switch to an alternative sequencing platform developer in the process of upgrading Illumina instruments. (PX7087 (Goswami (Illumina) Dep. at 16).)

Response to Finding No. 646.1

Complaint Counsel objects to the proposed finding because it is unsupported and vague.

The proposed finding is unsupported because the source cited (PX7087 (Goswami (Illumina) Dep. at 16) does not state or even relate to the purported fact.

The proposed finding is vague because it does not explain or define "Illumina's own model." Therefore, this Court should disregard the proposed finding.

1. **Feasibility**

647. Test developers routinely re-validate their tests to account for new developments in their tests, new and improved technology relating to consumables or sequencers, or for any number of other reasons. (RX3869 (Cote Expert Report) ¶ 338.) These revalidations are part of a good test developer's business plan. (RX3869 (Cote Expert Report) ¶ 338.) It is routine to switch or to upgrade platforms (which from a re-validation point of view is equivalent). (Cote Tr. 3739; Aravanis (Illumina) Tr. 1865; (RX3869 (Cote Expert Report) ¶ 338.) This is built into all clinical labs' workflow and plan for long-term functioning for the lab. (Cote Tr. 3771.)

Response to Finding No. 647

Complaint Counsel objects to the proposed finding because it is misleading, vague, speculative, and against the weight of the evidence, and it improperly cites expert testimony, Dr. Cote is not qualified to offer expert opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is unreliable.

The proposed finding is misleading because it implies that re-validating a test on an existing platform after a small change to one component is anywhere near equivalent to switching a test from an Illumina NGS platform to a purported alternative NGS platform.

[redacted]

[redacted]

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted nearly verbatim from Dr. Cote's report and represents only his opinion rather than market realities.

The proposed finding is against the weight of substantial evidence showing that switching to another NGS platform would cause significant delays, require significant costs, and pose regulatory and financial risks for MCED test developers. (*See* CCFF ¶¶ 1768-1901). MCED tests are developed to run on a specific NGS platform. (*See* CCFF ¶¶ 1768-79). [redacted] Illumina, Grail, and other NGS market participants recognize high switching costs. (*See* CCFF ¶¶ 1840-71). Switching NGS platforms is even more difficult once the MCED test has begun the FDA approval process. (*See* CCFF ¶¶ 1872-1901).

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only support for the purported facts in the proposed finding in contravention of this Court's Order. Dr. Cote has no personal knowledge or experience regarding switching an MCED test from one NGS platform to another (or developing an MCED test on any platform). This Court should disregard this evidence.

Moreover, Dr. Cote is not qualified to provide expert opinion testimony about switching an MCED test from one NGS platform to another because he has no experience developing MCED tests at all (*see* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)) or about which NGS platforms are viable for MCED testing because he has never operated an NGS instrument and has no publications related to NGS, among other reasons (*see* Response to RPFF ¶ 1964, below (examining Dr. Cote's lack of qualifications on subject of which NGS platforms are viable for MCED testing)). Dr. Cote is also not credible (*see* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects). In addition, Dr. Cote's opinion about switching an MCED test from Illumina's platform to a purported alternative platform is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight. Therefore, this Court should disregard the proposed finding.

648. Given that test developers will need to undergo such redevelopment simply to maintain their use of Illumina's instruments, there are multiple opportunities for test developers to switch to alternative sequencing platforms, or validate an alternative sequencing platforms for the purposes of managing their supply chain. (RX3869 (Cote Expert Report) ¶ 338.)

Response to Finding No. 648

Complaint Counsel objects to the proposed finding because it is vague, misleading, and against the weight of the evidence, and it improperly cites expert testimony, Dr. Cote is not qualified to offer expert opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

The proposed finding is also misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted verbatim from Dr. Cote's report and represents only his opinion rather than market realities.

The proposed finding is against the weight of substantial evidence showing that switching to another NGS platform would cause significant delays, require significant costs, and pose regulatory and financial risks for MCED test developers. (*See* CCFF ¶¶ 1768-1901). MCED tests are developed to run on a specific NGS platform. (*See* CCFF ¶¶ 1768-79).

Illumina, Grail, and other NGS market participants recognize high switching costs. (*See* CCFF ¶¶ 1840-71). Switching NGS platforms is even more difficult once the MCED test has begun the FDA approval process. (*See* CCFF ¶¶ 1872-1901).

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only support for the purported facts in the proposed finding in contravention of this Court's Order. Dr. Cote has no personal knowledge or experience regarding switching an MCED test from one NGS platform to another (or developing an MCED test on any platform). This Court should disregard this evidence.

Moreover, Dr. Cote is not qualified to provide expert opinion testimony about switching an MCED test from one NGS platform to another because he has no experience developing MCED tests at all (*see* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)) or about which NGS platforms are viable for MCED testing because he has never operated an NGS instrument and has no publications related to NGS, among other reasons (*see* Response to RPFF ¶ 1964, below (examining Dr. Cote's lack of qualifications on subject of which NGS platforms are viable for MCED testing)). Dr. Cote is also not credible (*see* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects). In addition, Dr. Cote's opinion about switching an MCED test from Illumina's platform to a purported alternative platform is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight. Therefore, this Court should disregard the proposed finding.

649. For companies developing early cancer screening tests, these requirements for such switching to a different NGS platform or another cancer screening modality are no different from the requirements to modify their tests to use different biomarkers, different reagents, or different testing equipment, for versioning, costs, or whatever the reason, either during or after

the initial development of the tests, which happens rather frequently. (RX3869 (Cote Expert Report) ¶ 339; Cote Tr. 3786–87.)

Response to Finding No. 649

Complaint Counsel objects to the proposed finding because it is vague, misleading, and against the weight of the evidence, and it improperly cites expert testimony, Dr. Cote is not qualified to offer expert opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

The proposed finding is vague because it is unclear what "such switching" refers to, it does not explain what the "another cancer screening modality" or "modify their tests" means, it does not identify any purported "different NGS platform," and it does not define "versioning." The proposed finding is also vague in its use of "whatever the reason." It is also not clear what is meant by "rather frequently."

The proposed finding is misleading because it implies that making any type of ill-defined midification to a test on an existing platform is anywhere near equivalent to switching a test from an Illumina NGS platform to a purported alternative NGS platform.

The proposed finding is also misleading because—like numerous of Respondents' other proposed findings—it merely copies and pastes an entire paragraph from Dr. Cote's report verbatim and represents only his opinion rather than market realities.

The proposed finding is against the weight of substantial evidence showing that switching to another NGS platform would cause significant delays, require significant costs, and pose regulatory and financial risks for MCED test developers. (*See generally* CCFF ¶¶ 1768-1901). MCED tests are developed to run on a specific NGS platform. (*See* CCFF ¶¶ 1768-79). [redacted]

[redacted] Illumina, Grail, and other NGS market participants recognize high switching costs. (*See* CCFF ¶¶ 1840-71). Switching NGS platforms is even more difficult once the MCED test has begun the FDA approval process. (*See* CCFF ¶¶ 1872-1901).

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only support for the purported facts in the proposed finding in contravention of this Court's Order. Dr. Cote has no personal knowledge or experience regarding switching an MCED test from one NGS platform to another (or developing an MCED test on any platform). This Court should disregard this evidence.

Moreover, Dr. Cote is not qualified to provide expert opinion testimony about switching an MCED test from one NGS platform to another because he has no experience developing MCED tests at all (*see* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)) or about which NGS platforms are viable for MCED testing because he has never operated an NGS instrument and has no publications related to NGS, among other reasons (*see* Response to RPFF ¶ 1964, below (examining Dr. Cote's lack of qualifications on subject of which NGS platforms are viable for MCED testing)). Dr. Cote is also not credible (*see* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects). In addition, Dr. Cote's opinion about switching an MCED test from Illumina's platform to a purported alternative platform is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight. Therefore, this Court should disregard the proposed

finding.

650. [redacted] RX3419 (Lennon et al., 2020) at 18; RX3772 (Cohen 2018 Supplementary Material) at 2–3.) [redacted]

Response to Finding No. 650

[redacted]

[redacted]

650.1 [redacted]

Response to Finding No. 650.1

[redacted]

[redacted]

651. Similarly, FMI is using Illumina's HiSeq 2500 and 4000 as its NGS platforms for the FoundationOne CDx test for tissue biopsy sample based therapy selection, but switched to Illumina's NovaSeq 6000 for its FoundationOne® Liquid CDx test for liquid biopsy sample based therapy selection. (RX3231 (FMI) at 4; RX3234 (FMI) at 7.) There is no indication that

switching from HiSeq to NovaSeq meaningfully delayed FMI's development of the FoundationOne® Liquid CDx test, or its FDA approval, and neither Roche nor FMI have stated publicly that FMI faced delays from such switching. (RX3869 (Cote Expert Report) ¶ 341.)

Response to Finding No. 651

Complaint Counsel objects to the proposed finding because it is misleading and against the weight of the evidence, it improperly cites expert testimony, Dr. Cote is not qualified to provide expert opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is unreliable.

The proposed finding is misleading because it attempts to portray the purported fact that FMI developed one test (FoundationOne CDx tissue biopsy test) on the Illumina HiSeq platform and then later developed a *different* test (FoundationOne Liquid CDx liquid biopsy test) on the Illumina NovaSeq platform as an example of switching an existing test from one platform to another. It is not an example of switching; they are two different tests.

[redacted]

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted verbatim from Dr. Cote's report and represents only his opinion rather than market realities.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as support for purported facts in the proposed finding in contravention of this Court's Order. Dr. Cote has no personal knowledge regarding FMI's test development. This Court should disregard this evidence.

Moreover, Dr. Cote is not qualified to provide expert opinion testimony about switching an MCED test from one NGS platform to another because he has no experience developing MCED tests at all (*see* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)) or about which NGS platforms are viable for MCED testing because he has never operated an NGS instrument and has no publications related to NGS, among other reasons (*see* Response to RPFF ¶ 1964, below (examining Dr. Cote's lack of qualifications on subject of which NGS platforms are viable for MCED testing)). Dr. Cote is also not credible (*see* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects). In addition, Dr. Cote's opinion about switching an MCED test from Illumina's platform to a purported alternative platform is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight. Therefore, this Court should disregard the proposed finding.

652. Natera and BGI Genomics formed a partnership to commercialize Natera's Signatera NGS-based cancer monitoring test on BGI's DNBSEQ platform in China, and has now launched a version of the Signatera test in China "that incorporates MGI sequencing platforms." (PX7111 (Fesko (Natera) Dep. at 251–52); RX3062 (BGI) at 1.) Natera's Signatera test was initially validated on Illumina's HiSeq 2500 NGS platform. (RX3499 (Natera) at 6.)

Response to Finding No. 652

Complaint Counsel objects to the proposed finding because it misattributes the source of

a document, it cites unreliable hearsay, it is vague, misleading, unsupported, and against the weight of the evidence, it improperly cites expert testimony, Dr. Cote is not qualified to offer expert opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

Complaint Counsel objects to the attribution of RX3062 to BGI as the source of the document, in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3. RX3062 appears to be a document Respondents purportedly captured from BGI's website at a now-broken URL. The document appears to be incomplete, as it is missing the footnotes. The document itself constitutes unreliable hearsay. It is an untested statement, not produced by BGI, which Respondents offer for the truth and attribute to a party that did not testify in this proceeding. Given the inherent unreliable nature of the document, it lacks probative value (*see* Rule 4.43(b)). This court should disregard RX3062. Respondents elected not to pursue any form of discovery from BGI in this action, likely because they know such evidence would not support their contention that BGI will be a feasible alternative NGS platform available to MCED developers in the United States any time in the foreseeable future. Indeed, Illumina has obtained discovery from BGI on this very topic in another proceeding, prompting the court to conclude that BGI's CoolMPS technology is "neither mature nor commercially viable." *Illumina, Inc. v. BGI Genomics Co., Ltd.*, No. 3:19-cv-03770, 2022 WL 899421, at *25 (N.D. Cal. Mar. 27, 2022) (noting the deposition testimony of Jian Wang, BGI's Chairman: "Q: Do you consider the CoolMPS sequencers to be an important product line of BGI? A: No.").

[redacted]

[redacted]

The proposed finding is also misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted verbatim from Dr. Cote's report and represents only his opinion rather than market realities.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as support for purported facts in the proposed finding in contravention of this Court's Order. Dr. Cote has no personal knowledge regarding Natera's test development. This Court should disregard this evidence.

Moreover, Dr. Cote is not qualified to provide expert opinion testimony about switching an MCED test from one NGS platform to another because he has no experience developing MCED tests at all (*see* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)) or about which NGS platforms are viable for MCED testing because he has never operated an NGS instrument and has no publications related to NGS, among other reasons (*see* Response to RPFF ¶ 1964, below (examining Dr. Cote's lack of qualifications on subject of which NGS platforms are viable for MCED testing)). Dr. Cote is also not credible (*see* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects). In addition, Dr. Cote's opinion about switching an MCED test from Illumina's platform to a purported alternative platform is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed

publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight. Therefore, this Court should disregard the proposed finding.

653. Ariosa (at the time part of Roche) switched its Harmony non-invasive prenatal test from an NGS-based approach to a microarray-based approach, and claimed to have achieved lower cost and decreased turnaround time for the test. (PX7096 (Song (Omniome) Dep. at 124–28); RX3400 (Juneau et al., 2014).) Ariosa completed this platform switching without interrupting the commercial availability of the Harmony test. (PX7096 (Song (Omniome) Dep. at 125–26).)

Response to Finding No. 653

Complaint Counsel objects to the proposed finding because it cites unreliable testimony and is misleading, it does not cite Dr. Cote as the true source of this purported fact, Dr. Cote is not qualified to offer expert opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

The proposed finding cites to deposition testimony for which Respondents asked an improper leading question to elicit the response. (PX7096 (Song (Omniome) Dep. at 125) ("Q. And you did succeed in making that conversion, didn't you?")). As such this statement is unclear, unreliable and should be disregarded.

The proposed finding is misleading because it concerns a non-invasive prenatal test (and provides zero technical details about that test), not an MCED test. NIPT is a different application than MCED, and the purported fact that one NIPT test was able to be switched from an NGS platform to a microarray platform is not evidence that any MCED test at issue in the present matter could be performed on a microarray.

The proposed finding is misleading because it suggests that Ariosa changed its NIPT test from running on an NGS platform to running on a microarray platform because there were

advantages to microarrays. [redacted]

The proposed finding is misleading because it implies that Ariosa's transfer of its NIPT test to a microarray platform did not impact the quality of the test. In fact, Dr. Song testified that "in terms of the plans that we had, had we stayed on an NGS platform, we were not able to further make those development efforts on the array-based platform." (PX7096 (Song (Omniome) Dep. at 125)).

The proposed finding is against the weight of the evidence that microarrays do not work for MCED testing (*see* CCFF ¶¶ 1407-40). Moreover, Dr. Song testified that Ariosa abandoned its plans for developing oncology tests because ctDNA was not detectable on a microarray. (PX7071 (Song (Omniome) IHT at 98–99)). Dr. Song also testified that detecting ctDNA was "beyond the technical possibilities of an array system" because microarrays do not have the level of sensitivity necessary to detect rare events such as ctDNA. (PX7071 (Song (Omniome) IHT at 99)).

The proposed finding is also misleading because—like numerous of Respondents' other proposed findings—it is taken nearly verbatim from Dr. Cote's report (RX3869 (Cote Report) ¶ 343) and represents only his opinion rather than market realities. Moreover, it is misleading because Respondents do not attribute the purported fact to Dr. Cote as the source. Dr. Cote is not qualified to provide expert opinion testimony about switching an MCED test from one NGS

platform to another because he has no experience developing MCED tests at all (*see* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)) or about which NGS platforms are viable for MCED testing because he has never operated an NGS instrument and has no publications related to NGS, among other reasons (*see* Response to RPFF ¶ 1964, below (examining Dr. Cote's lack of qualifications on subject of which NGS platforms are viable for MCED testing)). Dr. Cote is also not credible (*see* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across these subjects). In addition, Dr. Cote's opinion about switching an MCED test from Illumina's platform to a purported alternative platform is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight. Therefore, this Court should disregard the proposed finding.

654. [redacted]

Response to Finding No. 654.1

[redacted]

[redacted]

[redacted]

654.2 [redacted]

Response to Finding No. 654.2

[redacted]

[redacted]

655. In addition, a test developer may develop its test on one platform, but choose to commercialize on another. (RX3869 (Cote Expert Report) ¶ 345.) [redacted]

Response to Finding No. 655

[redacted]

[redacted]

[redacted]

656. Even if switching requires a more substantial change, for example in capture technology or a different/unfamiliar sequencing chemistry, in light of the long way multi-cancer screening tests have to go before commercialization, the time to switch is unlikely to meaningfully affect the test developer's timeline. (Cote Tr. 3776.)

Response to Finding No. 656

Complaint Counsel objects to the proposed finding because it is unsupported, vague, speculative, Dr. Cote is not qualified to offer expert opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

The proposed finding is unsupported because the source cited (Cote Tr. 3776) does not discuss or relate to "capture technology" or "different/unfamiliar sequencing chemistry."

The proposed finding is vague because it does not explain what "a more substantial change" is in relation to. The proposed finding is also vague because it does not define "capture technology," or "different/unfamiliar sequencing chemistry." It also does not explain what is meant by "in light of the long way multi-cancer screening tests have to go before commercialization" or what it means to "meaningfully affect" the test developer's timeline.

The proposed finding is inherently speculative. For support, Respondents cite only paid testimony of a purported expert (Cote Tr. 3776) that is uncorroborated by any ordinary course documents or analysis. Given the inherent unreliability of this testimony as well as lack of foundation or explanation for the base conjecture, this proposed finding of fact should be disregarded.

Moreover, Dr. Cote is not qualified to provide expert opinion testimony about switching an MCED test from one NGS platform to another because he has no experience developing

MCED tests at all (*see* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)) or about which NGS platforms are viable for MCED testing because he has never operated an NGS instrument and has no publications related to NGS, among other reasons (*see* Response to RPFF ¶ 1964, below (examining Dr. Cote's lack of qualifications on subject of which NGS platforms are viable for MCED testing)). Dr. Cote is also not credible (*see* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across subjects). In addition, Dr. Cote's opinion about switching an MCED test from Illumina's platform to a purported alternative platform is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight. Therefore, this Court should disregard the proposed finding.

> 656.1 For example, it took approximately nine months for Dr. Cote's lab to revalidate the AML clinical trial exome assay to use a different library prep and exome capture reagent, while transitioning from HiSeq to NovaSeq, with substantially different sequencing chemistry. (RX3869 (Cote Expert Report) ¶ 346; Cote Tr. 3774–75.)

Response to Finding No. 656.1

Complaint Counsel objects to the proposed finding because it is vague, misleading, speculative, Dr. Cote is not qualified to offer expert opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

The proposed finding is vague because it does not define the "AML clinical trial exome assay."

The proposed finding is misleading because it discusses a test that is not a liquid biopsy assay and not an MCED test. Evidence related to purportedly switching a non-MCED non-liquid

biopsy test from one Illumina sequencer to another does not provide support for the time it would take to switch an MCED test from an Illumina NGS instrument to a non-Illumina NGS instrument.

Complaint Counsel agrees that even for a test that is not a liquid biopsy assay and not an MCED test, switching NGS platforms (even from one Illumina platform to another) still requires many months of effort.

[redacted]

[redacted]

[redacted]

2. **Expectations**

657. Although it cannot be estimated precisely how long it would take for a multi-cancer screening test to switch between an Illumina platform and a third party sequencing platform, for example, the length of time required would likely depend on a number of factors including whether clinical trials are required, the laboratory process, and access to validation scientists and clinical samples. (RX3869 (Cote Expert Report) ¶ 347.)

Response to Finding No. 657

Complaint Counsel objects to the proposed finding because it is vague, misleading, and against the weight of the evidence, Dr. Cote is not qualified to offer expert opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

The proposed finding is vague because it does not refer to any specific "multi cancer screening test" and does not refer to any specific "third party sequencing platform." The proposed finding is also vague because it does not explain what types of "clinical trials" it is referring to. It is also vague because it does not list all of the factors that the length of time purportedly depends on.

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted nearly verbatim from Dr. Cote's report and represents only his opinion rather than market realities.

The proposed finding is against the weight of substantial evidence showing that switching to another NGS platform would cause significant delays, require significant costs, and pose regulatory and financial risks for MCED test developers. [redacted]

[redacted]

[redacted]

[redacted]

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only support for the purported facts in the proposed finding in contravention of this Court's Order. Dr. Cote has no personal knowledge or experience regarding switching an MCED test from one NGS platform to another (or developing an MCED test on any platform). This Court should disregard this evidence.

[redacted]

[redacted] Therefore, this Court should disregard the proposed finding.

658. Assuming no clinical trials are required, a test developer may need to conduct a revalidation study (which is estimated to take 6–12 months) potentially followed by a bridging or comparison study (which can take up to one month). (Aravanis (Illumina) Tr. 1865.) In the re-validation stage, a test developer needs to repeat the analytical studies on a new NGS platform. (RX3869 (Cote Expert Report) ¶ 348.)

Response to Finding No. 658

Complaint Counsel objects to the proposed finding because it is vague, misleading, and against the weight of the evidence, Dr. Cote is not qualified to offer expert opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

The proposed finding is vague because it begins with "[a]ssuming no clinical trials are required" but does not explain the basis for that assumption. The proposed finding is vague because it does not define "revalidation study" or "bridging or comparison study." The proposed finding is also vague because it does not specific what test or type of test is it referring to, nor does it identify the purported "new NGS platform" it references.

The proposed finding is misleading because it assumes a test developer undertaking to switch an MCED test to a new NGS platform would be able to immediately commence an analytical validation study. This is against the weight of substantial evidence showing that that a very significant amount of work would precede the point of even commencing a final analytical validation [redacted] For example, [redacted]

[redacted]

[redacted]

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted nearly verbatim from Dr. Cote's report and

represents only his opinion rather than market realities.

The proposed finding is also misleading because, although Dr. Cote cited no support for this statement in his report (RX3869 (Cote Expert Report) ¶ 348), Respondents now fill in that hole by citing self-serving trial testimony from Illumina executive Alex Aravanis as the primary source for this purported fact. To be clear, *first* Dr. Cote wrote a report that ignored market realities in order to craft a narrative that fit Respondents' case, *then* Respondents generated this testimony on demand since they could not find support in the form of reliable evidence such as ordinary course documents and unbiased witness testimony.

This proposed finding is inherently speculative. For support, Respondents cite only to the self-serving testimony of Illumina executive Alex Aravanis and the paid testimony of Dr. Cote that is uncorroborated by any ordinary course documents or analysis. Given the inherent unreliability of this testimony as well as lack of foundation or explanation for the witnesses' base conjecture, this proposed finding of fact should be disregarded.

The proposed finding is against the weight of substantial evidence showing that switching to another NGS platform would cause significant delays, require significant costs, and pose regulatory and financial risks for MCED test developers. [redacted]

This Court ordered that experts shall not be cited to "support factual propositions that

should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only support for purported facts in the proposed finding in contravention of this Court's Order. Dr. Cote has no personal knowledge or experience regarding switching an MCED test from one NGS platform to another (or developing an MCED test on any platform). This Court should disregard this evidence.

[redacted] Therefore, this Court should disregard the proposed finding.

659. Dr. Cote estimates that re-validating a test on a new NGS platform, if successful, would take approximately 6–12 months. (Cote Tr. 3774–75.) For a test developer to re-validate its test on a new NGS instrument, it would need to show that the performance of the test on the new machine was appropriate and similar to the performance using Illumina's machine. (RX3869 (Cote Expert Report) ¶ 348; Cote Tr. 3773.)

Response to Finding No. 659

Complaint Counsel objects to the proposed finding because it is vague, misleading, and against the weight of the evidence, it improperly cites expert testimony, Dr. Cote is not qualified to offer expert opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

The proposed finding is vague because it does not define "re-validating" or "bridging or comparison study" and does not explain what "appropriate and similar" means. The proposed finding is also vague because it does not specific what test or type of test is it referring to, nor does it identify the purported "new NGS platform" it references.

The proposed finding is misleading because it assumes a test developer undertaking to switch an MCED test to a new NGS platform would be able to immediately commence an analytical validation study. This is against the weight of substantial evidence showing that that a very significant amount of work would precede the point of even commencing a final analytical validation [redacted] For example, [redacted]

[redacted]

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted nearly verbatim from Dr. Cote's report and represents only his opinion rather than market realities.

The proposed finding is against the weight of substantial evidence showing that switching to another NGS platform would cause significant delays, require significant costs, and pose regulatory and financial risks for MCED test developers. [redacted]

[redacted]

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only support for purported facts in the proposed finding in contravention of this Court's Order. Dr. Cote has no personal knowledge or experience regarding switching an MCED test from one NGS platform to another (or developing an MCED test on any platform). This Court should disregard this evidence.

[redacted]

[redacted] Therefore, this Court should disregard the proposed finding.

660. For an LDT test not approved by the FDA, switching NGS platforms or technical modalities is fairly straightforward. (RX3869 (Cote Expert Report) ¶ 349.) The test developer merely needs to complete the technical development, and then conduct a validational, case-control study using previously collected samples or freshly collected sample. (RX3869 (Cote Expert Report) ¶ 349.)

Response to Finding No. 660

Complaint Counsel objects to the proposed finding because it is vague, misleading, and against the weight of the evidence, it improperly cites expert testimony, Dr. Cote is not qualified to offer expert opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

The proposed finding is vague because it does not define "technical modalities," "technical development," or "validational case-control study." and it is not clear what "fairly straightforward" means. The proposed finding is also vague because it does not specific what test or type of test is it referring to, nor does it identify the purported "NGS platforms" it references.

The proposed finding is misleading because, what Dr. Cote characterizes as "the test developer *merely* needs to complete the technical development" is in fact a monumental undertaking. Dr. Cote simply assumes with no basis that a test developer undertaking to switch an MCED test to a new NGS platform would be able to immediately commence an analytical validation study. This is against the weight of substantial evidence showing that that a very significant amount of work would precede the point of even commencing a final analytical validation [redacted] For example, [redacted]

[redacted]

[redacted]

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted verbatim from Dr. Cote's report and represents only his opinion rather than market realities.

The proposed finding is against the weight of substantial evidence showing that switching to another NGS platform would cause significant delays, require significant costs, and pose regulatory and financial risks for MCED test developers. [redacted]

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only support for the purported facts in the proposed finding in contravention of this Court's Order. Dr. Cote has no personal knowledge or experience regarding switching an MCED test from one NGS platform to another (or developing an MCED test on any platform). This Court should disregard this evidence.

[redacted]

[redacted] Therefore, this Court should disregard the proposed finding.

661. Dr. Cote expects that most test developers who are already working on or have validated a test will have access to banks of clinical samples (used for that validation), which can be revalidated retrospectively for these purposes in relatively short order. (RX3869 (Cote Expert Report) ¶ 349.)

Response to Finding No. 661

Complaint Counsel objects to the proposed finding because it is vague, misleading, and against the weight of the evidence, it improperly cites expert testimony, Dr. Cote is not qualified to offer expert opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

The proposed finding is vague because it does not define "validated" or "validation" and it does not explain what "revalidated retrospectively for these purposes" means. It is also imprecise and unclear as to what is meant by "in relatively short order."

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted practically verbatim from Dr. Cote's report and represents only his opinion rather than market realities.

The proposed finding is against the weight of substantial evidence showing that switching to another NGS platform would cause significant delays, require significant costs, and pose regulatory and financial risks for MCED test developers. [redacted]

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only support for the purported facts in the proposed finding in contravention of this Court's Order. Dr. Cote has no personal knowledge or experience regarding switching an MCED test from one NGS platform to another (or developing an MCED test on any platform). This Court should disregard this evidence.

[redacted]

[redacted] Therefore, this Court should disregard the proposed finding.

662. For an IVD test approved by the FDA, if the clinical testing portion of the IVD test has changed since the clinical trial demonstrating its efficacy, the FDA requires the IVD sponsor to provide data from a bridging or comparison study to demonstrate that the new clinical test using the third party NGS platform "has performance characteristics that are very similar to those of the test that was used in the trial," *i.e*, using the Illumina platform. (Cote Tr. 3776; RX3218 (FDA) at 30).)

Response to Finding No. 662

Complaint Counsel objects to the proposed finding because it is vague, misleading, and against the weight of the evidence, it improperly cites expert testimony, Dr. Cote is not qualified to offer expert opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

The proposed finding is vague because it does not explain what "the clinical testing portion of the IVD test" means. It is also does not define or explain what "bridging or comparison study" means. It is also vague because it does not identify the purported "third party NGS platform" it references.

[redacted]

[redacted] For example, [redacted]

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted practically verbatim from Dr. Cote's report (RX3869 (Cote Report) ¶ 350), even though Respondents do not even cite his report in the proposed finding, and represents only his opinion rather than market realities.

The proposed finding is against the weight of substantial evidence showing that switching to another NGS platform would cause significant delays, require significant costs, and pose regulatory and financial risks for MCED test developers. [redacted]

[redacted]

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as support for purported facts in the proposed finding in contravention of this Court's Order. Dr. Cote has no personal knowledge or experience regarding switching an MCED test from one NGS platform to another (or developing an MCED test on any platform). This Court should disregard this evidence.

[redacted]

[redacted] Therefore, this Court should disregard the proposed finding.

663. The performance similarity is often demonstrated in a bridging or comparison study by performing the new test using original clinical trial samples and a pre-specified statistical analysis plan, thereby showing both concordance and discordance between the two tests using the same specimens. (RX3218 (FDA) at 30.)

Response to Finding No. 663

Complaint Counsel objects to the proposed finding because it is vague, misleading, and against the weight of the evidence, Dr. Cote is not qualified to offer expert opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

The proposed finding is vague because it is not clear what "the performance similarity" refers to. The proposed finding also does not define or explain what "bridging or comparison study," "original clinical trial samples," "pre-specified statistical analysis plan," "concordance," or "discordance" mean.

The proposed finding is misleading because Dr. Cote claims the FDA would simply require a "bridging or comparison study" as opposed to a new clinical trial. There is no basis for this assumption and it is against the weight of the evidence showing that switching an FDA-approved test to a new NGS platform would necessitate conducting a lengthy equivalency study and possibly new clinical trials [redacted] For example, [redacted]

[redacted]

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted verbatim from Dr. Cote's report (RX3869 (Cote Report) ¶ 350), even though Respondents do not even cite his report in the proposed finding, and represents only his opinion rather than market realities.

The proposed finding is against the weight of substantial evidence showing that switching to another NGS platform would cause significant delays, require significant costs, and pose regulatory and financial risks for MCED test developers. [redacted]

[redacted] Therefore, this Court should disregard the proposed finding.

> 663.1 Such a requirement also means that a costly new clinical trial need not be conducted: the IVD sponsor just need to run the new test on the already collected sample to show consistent results. (RX3869 (Cote Expert Report) ¶ 350.) If the results of the bridging or comparison study demonstrate that the two platforms lead to equivalent performance, no additional clinical trials may be required. (RX3869 (Cote Expert Report) ¶ 350.)

Response to Finding No. 663.1

Complaint Counsel objects to the proposed finding because it is vague, misleading, and against the weight of the evidence, it improperly cites expert testimony, Dr. Cote is not qualified to offer expert opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

The proposed finding is vague as to what "such a requirement" and "already collected

sample" refers to. The proposed finding also does not define or explain what constitute "consistent results" or "equivalent performance."

The proposed finding is misleading because Dr. Cote claims the FDA would simply require a "bridging or comparison study" as opposed to a new clinical trial. There is no basis for this assumption and it is against the weight of the evidence showing that switching an FDA-approved test to a new NGS platform would necessitate conducting a lengthy equivalency study and possibly new clinical trials [redacted] For example, [redacted]

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted verbatim from Dr. Cote's report (RX3869

(Cote Report) ¶ 350) and represents only his opinion rather than market realities.

The proposed finding is against the weight of substantial evidence showing that switching to another NGS platform would cause significant delays, require significant costs, and pose regulatory and financial risks for MCED test developers. [redacted]

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only support for the purported facts in the proposed finding in contravention of this Court's Order. Dr. Cote has no personal knowledge or experience regarding switching an MCED test from one NGS platform to another (or developing an MCED test on any platform). This Court should disregard this evidence.

[redacted]

[redacted] Therefore, this Court should disregard the proposed finding.

664. Dr. Cote estimates that conducting the bridging or comparison study—including a repeatability study—would take approximately one month to complete. (Cote Tr. 3773.) It would cost approximately $1 million to $2 million if samples need to be purchased. (Cote Tr. 3775.) [redacted] The time and cost of these bridging or comparison studies are both relatively low compared to overall development time and cost for clinical tests. (PX7065 (Aravanis (Illumina) IHT at 164–66); [redacted]

Response to Finding No. 664

[redacted]

[redacted]

[redacted]

[redacted]

665. If the results generated by the two systems were not substantially equivalent, the clinical studies might have to be repeated on the alternative platform. (RX3869 (Cote Expert Report) at 174.) If new clinical trials are required, or if the bridging or comparison study does not show that the Illumina platform and the third-party platform are equivalent, new large-scale clinical trials may be required, which would require a lengthier process and would be in addition to the revalidation process discussed in above. (RX3869 (Cote Expert Report) ¶ 352.)

Response to Finding No. 665

Complaint Counsel objects to the proposed finding because it is vague, misleading, and against the weight of the evidence, it improperly cites expert testimony, Dr. Cote is not qualified to offer expert opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

The proposed finding is vague as to what "the results generated by the two systems," "the clinical studies," or "revalidation process discussed in [sic] above" refer to. The proposed finding is also vague because it does not define or explain what constitute "substantially equivalent" means. The proposed finding is also vague because it is unclear what "a lengthier process" means.

The proposed finding is misleading because Dr. Cote claims clinical studies "might" have to be repeated on the alternative platform. This is against the weight of the evidence showing that switching an FDA-approved test to a new NGS platform would necessitate conducting a

lengthy equivalency study and possibly new clinical trials [redacted] For example, [redacted]

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted verbatim from Dr. Cote's report (RX3869 (Cote Report) ¶ 352) and represents only his opinion rather than market realities.

The proposed finding is also against the weight of substantial evidence showing that switching to another NGS platform would cause significant delays, require significant costs, and pose regulatory and financial risks for MCED test developers. [redacted]

[redacted]

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only support for the purported facts in the proposed finding in contravention of this Court's Order. Dr. Cote has no personal knowledge or experience regarding switching an MCED test from one NGS platform to another (or developing an MCED test on any platform). This Court should disregard this evidence.

[redacted]

[redacted] Therefore, this Court should disregard the proposed finding.

665.1 The chance for a bridging or comparison study failing to show the Illumina platform and the third-party platform to be equivalent is very low, because given the comparable accuracy of the third-party platforms, they should be able to accurately reproduce the sequence obtained using the Illumina platform. (Cote Tr. 3775–76; RX3869 (Cote Expert Report) ¶ 352.)

Response to Finding No. 665.1

Complaint Counsel objects to the proposed finding because it is vague, misleading, speculative, and against the weight of the evidence, it improperly cites expert testimony, Dr. Cote is not qualified to offer expert opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

The proposed finding is vague as to what "the comparable accuracy of the third-party platforms" means. The proposed finding is also vague because it does not define the "bridging or comparison study" or the standard for what it means to "accurately reproduce" the sequence obtained using the Illumina platform.

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted verbatim from Dr. Cote's report (RX3869 (Cote Report) ¶ 352) and represents only his opinion rather than market realities.

The proposed finding's claim that there is a "very low" chance that the undefined bridging study would fail given the comparable accuracy of the third party platforms amounts to nothing more than rank speculation by Dr. Cote. Respondents and Dr. Cote conveniently assume that other sequencing platforms have comparable accuracy, citing zero evidence, while ignoring the weight of contrary evidence. For example, [redacted]

[redacted]

The proposed finding is also against the weight of substantial evidence showing that switching to another NGS platform would cause significant delays, require significant costs, and pose regulatory and financial risks for MCED test developers. [redacted]

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only support for the purported facts in the proposed finding in contravention of this Court's Order. Dr. Cote has no personal knowledge or

experience regarding switching an MCED test from one NGS platform to another (or developing an MCED test on any platform). This Court should disregard this evidence.

[redacted] Therefore, this Court should disregard the proposed finding.

666. Another factor which will likely determine the length of time a company would need to adapt its test to a new supplier is the way the test was developed. (RX3869 (Cote Expert Report) ¶ 353.) Tests may be developed based on more than one platform. (RX3869 (Cote Expert Report) ¶ 353.)

Response to Finding No. 666

Complaint Counsel objects to the proposed finding because it is vague and unsupported, it improperly cites expert testimony, Dr. Cote is not qualified to offer expert opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

The proposed finding is vague in its use of the phrase "the way the test was developed."

The proposed finding is unsupported in that it provides no reliable evidence for the claim that tests may be developed based on more than one platform. The only source cited is Dr. Cote's expert report. This is insufficient, as it is not this Court's job to go dig into Dr. Cote's report and discern what if any actual documentary or testimonial evidence *from fact witnesses* may be listed there. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only support for the purported facts in the proposed finding in contravention of this Court's Order. Dr. Cote has no personal knowledge or experience regarding switching an MCED test from one NGS platform to another (or developing an MCED test on any platform). This Court should decline Respondents' invitation to do their work for them and disregard this evidence. Incidentally, the one flimsy piece of evidence Dr. Cote cites in ¶ 353 of his report is addressed in Complaint Counsel's Responses to RPFF ¶¶ 667-68, below.

[redacted]

[redacted] Therefore, this Court should disregard the proposed finding.g

667. Singlera has publicly stated that its test is compatible with both Illumina and Thermo Fisher NGS systems. RX3637 (Singlera) at 6.)

Response to Finding No. 667

Complaint Counsel objects to the proposed finding because it misattributes the source of a document and is against the weight of the evidence.

Complaint Counsel objects to the attribution of RX3637 (which Respondents purportedly captured from Singlera's website) to Singlera as the source of the document (it was not produced by Singlera), in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3. The document constitutes hearsay. It is an untested statement, which Respondents offer for the truth. Given the inherent unreliable nature of the documents, it has little to no probative value. (*See* Rule 4.43(b)).

The proposed finding is against the weight of the evidence showing that Singlera's PanSEER MCED test cannot be run on Thermo Fisher's platform. Singlera's Co-Founder and former CEO, Dr. Gary Gao, testified at trial that Singlera evaluated Thermo Fisher but concluded it was not an alternative: "Q. Has Singlera evaluated the use of NGS technology from any other vendor? A. Of course, you know, we always try to seek for alternative, like Thermo Fisher and other company, but … we evaluate it, it's not going to be a viable alternative. We are not sure even this product line will be continued. They are also not FDA-approved or FDA-cleared. Q.

Does Singlera currently have plans to switch to a Thermo Fisher NGS platform? A. No." (Gao (Singlera) Tr. 2894). This Court should disregard the proposed finding.

668. Singlera notes that its PanSeer assay is "compatible with the two leading next-generation sequencing platforms on the market (systems from Illumina such as the MiSeq or NextSeq as well as from Thermo Fisher Scientific including the Ion Torrent S5) any laboratory familiar with NGS library construction can quickly implement this method". (RX3637 (Singlera) at 6.) Therefore, switching between these two NGS suppliers would not be likely to require any significant time to adapt the technology for that developer. (RX3869 (Cote Expert Report) ¶ 353.)

Response to Finding No. 668

Complaint Counsel objects to the proposed finding because it misattributes the source of a document, is against the weight of the evidence, it is speculative, it improperly cites expert testimony, Dr. Cote is not qualified to offer expert opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

Complaint Counsel objects to the attribution of RX3637 (which Respondents purportedly captured from Singlera's website) to Singlera as the source of the document (it was not produced by Singlera), in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3. The document constitutes hearsay. It is an untested statement, which Respondents offer for the truth. Given the inherent unreliable nature of the documents, it has little to no probative value. (*See* Rule 4.43(b)).

The proposed finding is against the weight of the evidence showing that Singlera's PanSEER MCED test cannot be run on Thermo Fisher's platform. Singlera's Co-Founder and former CEO, Dr. Gary Gao, testified at trial that Singlera evaluated Thermo Fisher but concluded it was not an alternative: "Q. Has Singlera evaluated the use of NGS technology from any other vendor? A. Of course, you know, we always try to seek for alternative, like Thermo Fisher and other company, but … we evaluate it, it's not going to be a viable alternative. We are not sure even this product line will be continued. They are also not FDA-approved or FDA-cleared. Q.

Does Singlera currently have plans to switch to a Thermo Fisher NGS platform? A. No." (Gao (Singlera) Tr. 2894).

The proposed finding is speculative because, from the first purported fact (based on out-of-context, untested hearsay) in the proposed finding, Respondents make an extraordinary unfounded leap and infer that "[t]herefore, switching between these two NGS suppliers would not be likely to require any significant time to adapt the technology." To be clear, Dr. Gao's trial testimony established that Singlera *cannot use* the Thermo Fisher NGS platform for its PanSEER MCED test. Yet Respondents claim not only that Singlera *can* use the Thermo platform, but also that it would take no time to switch, citing nothing other than rank speculation by their paid purported multi subject expert Dr. Cote. This does not withstand basic scrutiny.

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted verbatim from Dr. Cote's report (RX3869 (Cote Report) ¶ 353) and represents only his opinion rather than market realities.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as support for purported facts in the proposed finding in contravention of this Court's Order. Dr. Cote has no personal knowledge or experience regarding running Singlera's PanSEER test (or developing any MCED test on any platform), much less switching PanSEER from Illumina's NGS platform to Thermo's. This Court should disregard this evidence.

[redacted]

[redacted] Therefore, this Court should disregard the proposed finding.

669. Natera and BGI Genomics formed a partnership and has now launched the Signatera in China "that incorporates MGI sequencing platforms." (RX3062 (BGI) at 1.) Neither Natera nor BGI has complained about any difficulty switching from Illumina's HiSeq to BGI's NGS platform. (RX3499 (Natera) at 6); (RX3869 (Cote Expert Report) ¶ 354.)

Response to Finding No. 669

Complaint Counsel objects to the proposed finding because it misattributes the source of a document, it cites unreliable hearsay, it is vague, misleading, unsupported, and against the weight of the evidence, it improperly cites expert testimony, Dr. Cote is not qualified to offer expert opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

Complaint Counsel objects to the attribution of RX3062 to BGI as the source of the document, in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3.

RX3062 appears to be a document Respondents purportedly captured from BGI's website at a now-broken URL. The document appears to be incomplete, as it is missing the footnotes. The document itself constitutes unreliable hearsay. It is an untested statement, not produced by BGI, which Respondents offer for the truth and attribute to a party that did not testify in this proceeding. Given the inherent unreliable nature of the document, it lacks probative value (*see* Rule 4.43(b)). This court should disregard RX3062. Respondents elected not to pursue any form of discovery from BGI in this action, likely because they know such evidence would not support their contention that BGI will be a feasible alternative NGS platform available to MCED developers in the United States any time in the foreseeable future. Indeed, Illumina has obtained discovery from BGI on this very topic in another proceeding, prompting the court to conclude that BGI's CoolMPS technology is "neither mature nor commercially viable." *Illumina, Inc. v. BGI Genomics Co., Ltd.*, No. 3:19-cv-03770, 2022 WL 899421, at *25 (N.D. Cal. Mar. 27, 2022) (noting the deposition testimony of Jian Wang, BGI's Chairman: "Q: Do you consider the CoolMPS sequencers to be an important product line of BGI? A: No.").

The proposed finding is vague because it does not define or identify "MGI sequencing platforms."

The proposed finding is misleading because it implies that BGI is running Natera's Signatera assay on BGI's sequencing platform in China. This is unsupported and against the weight of the evidence. [redacted]

The proposed finding is also misleading because—like numerous of Respondents' other proposed findings—it is merely copied and pasted verbatim from Dr. Cote's report and

represents only his opinion rather than market realities.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as support for purported facts in the proposed finding in contravention of this Court's Order. Dr. Cote has no personal knowledge regarding Natera's test development. This Court should disregard this evidence.

[redacted] Therefore, this Court should disregard the proposed finding.

670. Ariosa switched its Harmony NIPT test from an NGS-based approach to a microarray-based approach, and claimed to have achieved lower cost and decreased turnaround time for the test. (PX7096 (Song (Omniome) Dep. at 124–28); RX3400 (Juneau et al., 2014).)

Switching for the Harmony test, which is an LDT, required only a bridging study; no additional clinical trials were needed. (RX3869 (Cote Expert Report) ¶ 355.)

Response to Finding No. 670

Complaint Counsel objects to the proposed finding because it cites unreliable testimony, is unsupported, and is misleading, and Dr. Cote is not qualified to offer expert opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

The proposed finding is misleading because it concerns a non-invasive prenatal test (and provides zero technical details about that test), not an MCED test. NIPT is a different application than MCED, and the purported fact that one *NIPT test* was able to be switched from an NGS platform *to a microarray platform* is not evidence of the requirements for switching an *MCED test* from an Illumina NGS platform *to a different NGS platform*.

The proposed finding cites to deposition testimony for which Respondents asked an improper leading question to elicit the response. (PX7096 (Song (Omniome) Dep. at 125) ("Q. And you did succeed in making that conversion, didn't you?")). As such this statement is unclear, unreliable and should be disregarded.

The proposed finding is unsupported in that it provides no reliable evidence for the claim that switching the Harmony test required "only a bridging study; no additional clinical trials." The only source cited is Dr. Cote's expert report. This is insufficient, as it is not this Court's job to go dig into Dr. Cote's report and discern what if any actual documentary or testimonial evidence *from fact witnesses* may be listed there. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote as the only support for the purported facts in the proposed finding in contravention of this Court's Order. Dr. Cote has no personal knowledge or experience regarding any studies Ariosa conducted (or developing an

MCED test on any platform). This Court should decline Respondents' invitation to do their work for them and disregard this evidence.

The proposed finding is misleading because it suggests that Ariosa changed its NIPT test from running on an NGS platform to running on a microarray platform because there were advantages to microarrays. [redacted]

The proposed finding is misleading because it implies that Ariosa's transfer of its NIPT test to a microarray platform did not impact the quality of the test. In fact, Dr. Song testified that "in terms of the plans that we had, had we stayed on an NGS platform, we were not able to further make those development efforts on the array-based platform." (PX7096 (Song (Omniome) Dep. at 125)).

The proposed finding is against the weight of the evidence that microarrays do not work for MCED testing [redacted] Moreover, Dr. Song testified that Ariosa abandoned its plans for developing oncology tests because ctDNA was not detectable on a microarray. (PX7071 (Song (Omniome) IHT at 98–99)). Dr. Song also testified that detecting ctDNA was "beyond the technical possibilities of an array system" because microarrays do not have the level of sensitivity necessary to detect rare events such as ctDNA. (PX7071 (Song (Omniome) IHT at 99)).

The proposed finding is also misleading because—like numerous of Respondents' other

proposed findings—it is taken nearly verbatim from Dr. Cote's report and represents only his opinion rather than market realities. [redacted] Therefore, this Court should disregard the proposed finding.

670.1 For the bridging study, Ariosa conducted a case-control study with 878 maternal venous blood samples, 486 samples had been originally tested using Harmony, and 392 samples were freshly collected for the study. (RX3400 (Juneau et al., 2014) at 2.) [redacted]

Response to Finding No. 670.1

[redacted]

[redacted]

[redacted]

671. Companies routinely conduct bridging or comparison studies for modifications of their clinical oncology tests. (RX3869 (Cote Expert Report) ¶ 356.) [redacted]

Response to Finding No. 671

[redacted]

[redacted]

[redacted]

672. When Roche initiated its EURTAC study for the correlation between EGFR activating mutations and Non–Small-Cell Lung Cancer (NSCLC), the test utilized Sanger sequencing, then confirmed by fragment length analysis and Taqman assay for two mutations. (RX3057 (Benlloch et al., 2014) at 3.)

Response to Finding No. 672

Complaint Counsel objects to the proposed finding because it is misleading and against the weight of the evidence, it represents Dr. Cote's opinion testimony (though unattributed), Dr. Cote is not qualified to offer expert opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

The proposed finding is misleading because it concerns a tumor tissue test, not a liquid biopsy test. (RX3057 (Benlloch et al., 2014) at 3 (describing "FFPET specimens," which are

tumor tissue samples). The proposed finding is also misleading because it concerns a companion diagnostic test, not an MCED test. (RX3057 (Benlloch et al., 2014) at 1 ("We sought to validate … a companion diagnostic assay[.]"). The proposed finding is also misleading because it involves modifying a test that utilized Sanger sequencing to instead utilize a multiplex allele-specific PCR-based assay, not switching an MCED test from an Illumina NGS system to an alternative NGS system. (RX3057 (Benlloch et al., 2014) at 2-3 (The "cobas *EGFR* Mutation Test … is a … multiplex allele-specific PCR-based assay designed to detect 41 mutations exons 18, 19, 20, and 21 in [tumor tissue] specimens of human [non-small cell lung cancer]."). Allele-specific PCR, as the name implies, can only detect known mutations. The purported fact that a tumor tissue companion diagnostic test for a small number of known mutations switched from using Sanger sequencing to using multiplex PCR is simply not evidence of the requirements for switching an MCED liquid biopsy test from an Illumina NGS platform to an alternative NGS platform.

The proposed finding is against the weight of substantial evidence showing that switching to another NGS platform would cause significant delays, require significant costs, and pose regulatory and financial risks for MCED test developers. [redacted]

The proposed finding is also misleading because—like numerous of Respondents' other

proposed findings—it is copied and pasted verbatim from Dr. Cote's report (RX3869 (Cote Report) ¶ 356), even though Respondents do not attribute it to Dr. Cote, and represents only his opinion rather than market realities. [redacted] Therefore, this Court should disregard the proposed finding.

672.1 Roche developed a multiplex PCR-based cobas® EGFR Mutation Test of 41 *EGFR* mutations after patients had been screened and enrolled in EURTAC study using the previous LDT. (RX3221 (FDA) at 28.)

Response to Finding No. 672.1

Complaint Counsel objects to the proposed finding because it is misleading and against the weight of the evidence, it misattributes the source of a document, it represents Dr. Cote's opinion testimony (though unattributed), Dr. Cote is not qualified to offer expert opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

Complaint Counsel objects to the attribution of RX3221 to the FDA as the source of the document (it is unclear where Respondents obtained the document, but it was not produced by the FDA), in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3. Given the inherent unreliable nature of this document, it has little to no probative value. (*See* Rule 4.43(b)).

The proposed finding is misleading because it concerns a tumor tissue test, not a liquid biopsy test. (RX3057 (Benlloch et al., 2014) at 3 (describing "FFPET specimens," which are tumor tissue samples). The proposed finding is also misleading because it concerns a companion diagnostic test, not an MCED test. (RX3057 (Benlloch et al., 2014) at 1 ("We sought to validate … a companion diagnostic assay[.]"). The proposed finding is also misleading because it involves modifying a test that utilized Sanger sequencing to instead utilize a multiplex allele-specific PCR-based assay, not switching an MCED test from an Illumina NGS system to an alternative NGS system. (RX3057 (Benlloch et al., 2014) at 2-3 (The "cobas *EGFR* Mutation Test … is a … multiplex allele-specific PCR-based assay designed to detect 41 mutations exons 18, 19, 20, and 21 in [tumor tissue] specimens of human [non-small cell lung cancer]."). Allele-specific PCR, as the name implies, can only detect known mutations. The purported fact that a tumor tissue companion diagnostic test for a small number of known mutations switched from using Sanger sequencing to using multiplex PCR is simply not evidence of the requirements for switching an MCED liquid biopsy test from an Illumina NGS platform to an alternative NGS platform.

The proposed finding is against the weight of substantial evidence showing that switching to another NGS platform would cause significant delays, require significant costs, and pose regulatory and financial risks for MCED test developers. [redacted]

[redacted]

The proposed finding is also misleading because—like numerous of Respondents' other proposed findings—it is copied and pasted verbatim from Dr. Cote's report (RX3869 (Cote Report) ¶ 356), even though Respondents do not attribute it to Dr. Cote, and represents only his opinion rather than market realities. [redacted] Therefore, this Court should disregard the

proposed finding.

> 672.2 A retrospective bridging study was conducted to test tissue specimens already collected from the EURTAC study patients using the cobas® EGFR Mutation Test, and the EURTAC study results with the previous LDT data using Sanger sequencing and the bridging study results showing the concordance of the multiplex PCR-based cobas® EGFR Mutation Test results with the LDT supported the FDA approval of the cobas® EGFR Mutation Test. (RX3221 (FDA) at 28.)

Response to Finding No. 672.2

Complaint Counsel objects to the proposed finding because it is misleading and against the weight of the evidence, it misattributes the source of a document, it represents Dr. Cote's opinion testimony (though unattributed), Dr. Cote is not qualified to offer expert opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

Complaint Counsel objects to the attribution of RX3221 to the FDA as the source of the document (it is unclear where Respondents obtained the document, but it was not produced by the FDA), in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3. Given the inherent unreliable nature of this document, it has little to no probative value. (*See* Rule 4.43(b)).

The proposed finding is misleading because it concerns a tumor tissue test, not a liquid biopsy test. (RX3057 (Benlloch et al., 2014) at 3 (describing "FFPET specimens," which are tumor tissue samples). The proposed finding is also misleading because it concerns a companion diagnostic test, not an MCED test. (RX3057 (Benlloch et al., 2014) at 1 ("We sought to validate … a companion diagnostic assay[.]"). The proposed finding is also misleading because it involves modifying a test that utilized Sanger sequencing to instead utilize a multiplex allele-specific PCR-based assay, not switching an MCED test from an Illumina NGS system to an alternative NGS system. (RX3057 (Benlloch et al., 2014) at 2-3 (The "cobas *EGFR* Mutation Test … is a … multiplex allele-specific PCR-based assay designed to detect 41 mutations exons

18, 19, 20, and 21 in [tumor tissue] specimens of human [non-small cell lung cancer].”). Allele-specific PCR, as the name implies, can only detect known mutations. The purported fact that a tumor tissue companion diagnostic test for a small number of known mutations switched from using Sanger sequencing to using multiplex PCR is simply not evidence of the requirements for switching an MCED liquid biopsy test from an Illumina NGS platform to an alternative NGS platform.

The proposed finding is against the weight of substantial evidence showing that switching to another NGS platform would cause significant delays, require significant costs, and pose regulatory and financial risks for MCED test developers. (*See* CCFF ¶¶ 1768-1901). MCED tests are developed to run on a specific NGS platform. (*See* CCFF ¶¶ 1768-79). [redacted]

Illumina, Grail, and other NGS market participants recognize high switching costs. (*See* CCFF ¶¶ 1840-71). Switching NGS platforms is even more difficult once the MCED test has begun the FDA approval process. (*See* CCFF ¶¶ 1872-1901).

The proposed finding is also misleading because—like numerous of Respondents’ other proposed findings—it is copied and pasted verbatim from Dr. Cote’s report (RX3869 (Cote Report) ¶ 356), even though Respondents do not attribute it to Dr. Cote, and represents only his opinion rather than market realities. Dr. Cote is not qualified to provide expert opinion testimony about switching an MCED test from one NGS platform to another because he has no experience developing MCED tests at all (*see* Response to RPFF ¶ 1960, below (examining Dr. Cote’s lack of qualifications on subject of MCED development process and timeline)) or about which NGS platforms are viable for MCED testing because he has never operated an NGS

instrument and has no publications related to NGS, among other reasons (*see* Response to RPFF ¶ 1964, below (examining Dr. Cote's lack of qualifications on subject of which NGS platforms are viable for MCED testing)). Dr. Cote is also not credible (*see* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across subjects). In addition, Dr. Cote's opinion about switching an MCED test from Illumina's platform to a purported alternative platform is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight. Therefore, this Court should disregard the proposed finding.

672.3 The bridging study concluded that the "PCR test showed superior sensitivity and specificity compared with conventional Sanger sequencing." (RX3057 (Benlloch et al., 2014) at 2.)

Response to Finding No. 672.3

Complaint Counsel objects to the proposed finding because it is misleading and against the weight of the evidence, it represents Dr. Cote's opinion testimony (though unattributed), Dr. Cote is not qualified to offer expert opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

The proposed finding is misleading because it concerns a tumor tissue test, not a liquid biopsy test. (RX3057 (Benlloch et al., 2014) at 3 (describing "FFPET specimens," which are tumor tissue samples). The proposed finding is also misleading because it concerns a companion diagnostic test, not an MCED test. (RX3057 (Benlloch et al., 2014) at 1 ("We sought to validate … a companion diagnostic assay[.]"). The proposed finding is also misleading because it involves modifying a test that utilized Sanger sequencing to instead utilize a multiplex allele-specific PCR-based assay, not switching an MCED test from an Illumina NGS system to an

alternative NGS system. (RX3057 (Benlloch et al., 2014) at 2-3 (The "cobas *EGFR* Mutation Test … is a … multiplex allele-specific PCR-based assay designed to detect 41 mutations exons 18, 19, 20, and 21 in [tumor tissue] specimens of human [non-small cell lung cancer]."). Allele-specific PCR, as the name implies, can only detect known mutations. The purported fact that a tumor tissue companion diagnostic test for a small number of known mutations switched from using Sanger sequencing to using multiplex PCR is simply not evidence of the requirements for switching an MCED liquid biopsy test from an Illumina NGS platform to an alternative NGS platform.

The proposed finding is against the weight of substantial evidence showing that switching to another NGS platform would cause significant delays, require significant costs, and pose regulatory and financial risks for MCED test developers. (*See* CCFF ¶¶ 1768-1901). MCED tests are developed to run on a specific NGS platform. (*See* CCFF ¶¶ 1768-79). [redacted] Illumina, Grail, and other NGS market participants recognize high switching costs. (*See* CCFF ¶¶ 1840-71). Switching NGS platforms is even more difficult once the MCED test has begun the FDA approval process. (*See* CCFF ¶¶ 1872-1901).

The proposed finding is also misleading because—like numerous of Respondents' other proposed findings—it is copied and pasted verbatim from Dr. Cote's report (RX3869 (Cote Report) ¶ 356), even though Respondents do not attribute it to Dr. Cote, and represents only his opinion rather than market realities. Dr. Cote is not qualified to provide expert opinion testimony about switching an MCED test from one NGS platform to another because he has no experience developing MCED tests at all (*see* Response to RPFF ¶ 1960, below (examining Dr.

Cote's lack of qualifications on subject of MCED development process and timeline)) or about which NGS platforms are viable for MCED testing because he has never operated an NGS instrument and has no publications related to NGS, among other reasons (*see* Response to RPFF ¶ 1964, below (examining Dr. Cote's lack of qualifications on subject of which NGS platforms are viable for MCED testing)). Dr. Cote is also not credible (*see* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across subjects). In addition, Dr. Cote's opinion about switching an MCED test from Illumina's platform to a purported alternative platform is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight. Therefore, this Court should disregard the proposed finding.

673. When Guardant expanded its Guardant360® CDx cancer therapy selection assay to also include testing of *EGFR* exon 19 deletions and two specific mutations, *EGFR* L858R, *EGFR* T790M for treatment of NSCLC using Tagrisso® (osimertinib), it conducted two bridging studies – one for adding the test for *EGFR* exon 19 deletions and the *EGFR* L858R mutation, and one for adding the test for the *EGFR* T790M mutation – using existing samples from the original clinical trials. (RX3223 (FDA) at 49.)

Response to Finding No. 673

Complaint Counsel objects to the proposed finding because it is misleading and against the weight of the evidence, it misattributes the source of a document, it represents Dr. Cote's opinion testimony (though unattributed), Dr. Cote is not qualified to offer expert opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

Complaint Counsel objects to the attribution of RX3223 to the FDA as the source of the document (it is unclear where Respondents obtained the document, but it was not produced by the FDA), in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3. Given

the inherent unreliable nature of this document, it has little to no probative value. (*See* Rule 4.43(b)).

The proposed finding is misleading because it concerns a companion diagnostic test (which tests for a limited number of known mutations), not an MCED test (which screens for any mutations that may be present across large genomic regions). The proposed finding is also misleading because it involves modifying a test to screen for additional mutations while using the exact same Illumina NGS platform and method; it does not involve switching an MCED test from an Illumina NGS system to an alternative NGS system. (RX3223 at 2 Tbl. 1 (listing "*EGFR exon 19 deletions, L858R, and T790M**" mutations being added to panel), 3 Tbl. 2 (updated comprehensive list of all mutations contained in panel).) The purported fact that a companion diagnostic test (which assays a small number of known mutations) was updated to add a few additional mutations to the panel while continuing to run on the same Illumina NGS platform is simply not evidence of the requirements for *switching* an *MCED test* (which screens for unknown mutations across large genomic regions) from an Illumina NGS platform *to an alternative NGS platform*.

The proposed finding is also misleading because it does not even contain any information regarding the challenges, time, or costs associated with the purported bridging studies referenced.

The proposed finding is against the weight of substantial evidence showing that switching to another NGS platform would cause significant delays, require significant costs, and pose regulatory and financial risks for MCED test developers. (*See* CCFF ¶¶ 1768-1901). MCED tests are developed to run on a specific NGS platform. (*See* CCFF ¶¶ 1768-79). [redacted]

[redacted]

Illumina, Grail, and other NGS market participants recognize high switching costs. (*See* CCFF ¶¶ 1840-71). Switching NGS platforms is even more difficult once the MCED test has begun the FDA approval process. (*See* CCFF ¶¶ 1872-1901).

The proposed finding is also misleading because—like numerous of Respondents' other proposed findings—it is copied and pasted verbatim from Dr. Cote's report (RX3869 (Cote Report) ¶ 357), even though Respondents do not attribute it to Dr. Cote, and represents only his opinion rather than market realities. Dr. Cote is not qualified to provide expert opinion testimony about switching an MCED test from one NGS platform to another because he has no experience developing MCED tests at all (*see* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)) or about which NGS platforms are viable for MCED testing because he has never operated an NGS instrument and has no publications related to NGS, among other reasons (*see* Response to RPFF ¶ 1964, below (examining Dr. Cote's lack of qualifications on subject of which NGS platforms are viable for MCED testing)). Dr. Cote is also not credible (*see* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across subjects). In addition, Dr. Cote's opinion about switching an MCED test from Illumina's platform to a purported alternative platform is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight. Therefore, this Court should disregard the proposed finding.

674. FMI conducted a similar bridging study when it added testing of *NTRK* gene fusions for treatment of cancer patients with Vitrakvi® (larotrectinib) to its FoundationOne® CDx cancer therapy selection assay. (RX3240 (Roche/FMI) at 1–2.)

Response to Finding No. 674

Complaint Counsel objects to the proposed finding because it is misleading and against the weight of the evidence, it misattributes the source of a document, it represents Dr. Cote's opinion testimony (though unattributed), Dr. Cote is not qualified to offer expert opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

Complaint Counsel objects to the attribution of RX3240 (which Respondents appear to have captured from an FMI website) to Roche/FMI as the source of the document (the document was not produced by Roche/FMI), in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3. Given the inherent unreliable nature of this document, it has little to no probative value. (*See* Rule 4.43(b)).

The proposed finding is misleading because it concerns a tumor tissue test, not a liquid biopsy test. (RX3240 at 1.) The proposed finding is also misleading because it concerns a companion diagnostic test (which tests for a limited number of known mutations), not an MCED test (which screens for any mutations that may be present across large genomic regions). The proposed finding is also misleading because it involves modifying a test to screen for additional mutations while using the exact same Illumina NGS platform and method; it does not involve switching an MCED test from an Illumina NGS system to an alternative NGS system. (RX3240 at 1 ("FoundationOne CDx … is now approved to detect NTRK1/2/3 fusions"), 2 (describing full panel covering variants in 324 genes).) The purported fact that a tissue based companion diagnostic test (which assays a small number of known mutations) was updated to add a few additional mutations to the panel while continuing to run on the same Illumina NGS platform is simply not evidence of the requirements for *switching* a *liquid biopsy MCED test* (which screens

for unknown mutations across large genomic regions) from an Illumina NGS platform *to an alternative NGS platform*.

The proposed finding is also misleading because it does not even contain any information regarding the challenges, time, or costs associated with the purported bridging study referenced.

The proposed finding is against the weight of substantial evidence showing that switching to another NGS platform would cause significant delays, require significant costs, and pose regulatory and financial risks for MCED test developers. (*See* CCFF ¶¶ 1768-1901). MCED tests are developed to run on a specific NGS platform. (*See* CCFF ¶¶ 1768-79). [redacted]

Illumina, Grail, and other NGS market participants recognize high switching costs. (*See* CCFF ¶¶ 1840-71). Switching NGS platforms is even more difficult once the MCED test has begun the FDA approval process. (*See* CCFF ¶¶ 1872-1901).

The proposed finding is also misleading because—like numerous of Respondents' other proposed findings—it is copied and pasted verbatim from Dr. Cote's report (RX3869 (Cote Report) ¶ 358), even though Respondents do not attribute it to Dr. Cote, and represents only his opinion rather than market realities. Dr. Cote is not qualified to provide expert opinion testimony about switching an MCED test from one NGS platform to another because he has no experience developing MCED tests at all (*see* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)) or about which NGS platforms are viable for MCED testing because he has never operated an NGS instrument and has no publications related to NGS, among other reasons (*see* Response to RPFF ¶ 1964, below (examining Dr. Cote's lack of qualifications on subject of which NGS platforms

are viable for MCED testing)). Dr. Cote is also not credible (*see* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across subjects). In addition, Dr. Cote's opinion about switching an MCED test from Illumina's platform to a purported alternative platform is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight. Therefore, this Court should disregard the proposed finding.

D. Distributable IVDs

675. Several features of sequencing instruments and pipeline multi-cancer screening tests suggest that distributable IVDs would not be an appropriate option for MCED tests. (RX3869 (Cote Expert Report) ¶ 359.)

Response to Finding No. 675

Complaint Counsel objects to the proposed finding because it is vague and against the weight of the evidence, it improperly cites expert testimony, Dr. Cote is not qualified to offer expert opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

The proposed finding is vague because it does not identify the "several features" referenced. The proposed finding is also vague as to what "an appropriate option" means.

[redacted]

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3.

Here Respondents cite Dr. Cote as the only support for the purported facts in the proposed finding in contravention of this Court's Order. Dr. Cote has no personal knowledge or experience regarding developing an MCED test on any platform, much less determine whether to pursue a distributed kit IVD model for an MCED test. This Court should disregard this evidence.

The proposed finding is also misleading because—like numerous of Respondents' other proposed findings—it is copied and pasted verbatim from Dr. Cote's report and represents only his opinion rather than market realities. Dr. Cote is not qualified to provide expert opinion testimony about developing a distributed kit IVD version of an MCED test because he has no experience developing MCED tests at all (*see* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)) or about which NGS platforms are viable for MCED testing because he has never operated an NGS instrument and has no publications related to NGS, among other reasons (*see* Response to RPFF ¶ 1964, below (examining Dr. Cote's lack of qualifications on subject of which NGS platforms are viable for MCED testing)). Dr. Cote is also not credible (*see* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across subjects). In addition, Dr. Cote's opinion about developing distributed kit IVD versions of MCED tests is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight. Therefore, this Court should disregard the proposed finding.

676. [redacted]

; PX0064 (Illumina) at 7.)

Response to Finding No. 676

[redacted]

677. [redacted]

Response to Finding No. 677

[redacted]

[redacted]

[redacted]

677.1 For customers who are performing cancer screening using a centralized model (as is the case with an LDT or a single-site PMA), the evidence suggests that customers will be likely to be able to achieve full capacity. (Goswami (Illumina) Tr. 3194–95.)

Response to Finding No. 677.1

Complaint Counsel objects to the proposed finding because it is vague and misleading, it represents Dr. Cote's opinion testimony (though unattributed), it is inherently speculative, Dr. Cote is not qualified to offer expert opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

The proposed finding is vague because it does not identify any particular NGS platform, does not explain the type of "customers" referred to, and does not define "full capacity."

The proposed finding is misleading to the extent it suggests that customers performing cancer screening tests that may ultimately be offered as a distributed kit IVD model would not have sufficient testing volumes to operate their NGS platforms cost effectively. [redacted]

The proposed finding is also misleading because—like numerous of Respondents' other proposed findings—it is copied and pasted verbatim from Dr. Cote's report (RX3869 (Cote Report) ¶ 360), even though Respondents do not attribute it to Dr. Cote, and represents only his opinion rather than market realities.

The proposed finding is also misleading because, although Dr. Cote cited no support for this statement in his report (RX3869 (Cote Expert Report) ¶ 360), Respondents now fill in that hole by citing self-serving trial testimony from Illumina executive Joydeep Goswami as the primary source for this purported fact. To be clear, *first* Dr. Cote wrote a report that ignored market realities in order to craft a narrative that fit Respondents' case, *then* Respondents generated this testimony on demand since they could not find support in the form of reliable evidence such as ordinary course documents and unbiased witness testimony.

This proposed finding is inherently speculative. For support, Respondents cite only to the self-serving testimony of Illumina executive Joydeep Goswami that is uncorroborated by any ordinary course documents or analysis. Given the inherent unreliability of this testimony as well as lack of foundation or explanation for the witness's base conjecture, this proposed finding of fact should be disregarded.

Dr. Cote is not qualified to provide expert opinion testimony about developing a distributed kit IVD version of an MCED test because he has no experience developing MCED tests at all (*see* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)) or about which NGS platforms are viable for MCED testing because he has never operated an NGS instrument and has no publications related to NGS, among other reasons (*see* Response to RPFF ¶ 1964, below (examining Dr. Cote's lack of qualifications on subject of which NGS platforms are viable for MCED testing)). Dr. Cote is also not credible (*see* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across subjects). In addition, Dr. Cote's opinion about developing distributed kit IVD versions of MCED tests is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-

known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight. Therefore, this Court should disregard the proposed finding.

677.2 In a distributed model, a small hospital or laboratory—precisely the types of customers who purportedly benefit from distributed kitted tests—are unlikely to be able to achieve the throughput necessary to make a NovaSeq Dx platform cost-effective. (Goswami (Illumina) Tr. 3194–95.) [redacted]

Response to Finding No. 677.2

[redacted]

[redacted]

[redacted]

678. In addition, with respect to distributable IVD test kits, there are several reasons why Illumina's position as a platform provider is relatively weaker with respect to distributable IVDs than in other areas. (RX3869 (Cote Expert Report) ¶ 361.)

Response to Finding No. 678

Complaint Counsel objects to the proposed finding because it is confusing, vague, and misleading, Dr. Cote is not qualified to offer expert opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

The proposed finding is confusing because it begins with "[i]n addition."

The proposed finding is vague because the meaning of "Illumina's position as a platform provider" is unclear. The proposed finding is also vague because it does not define or explain what "relatively weaker" means and does not identify the "other areas" referred to.

The proposed finding is misleading because it is merely copied and pasted verbatim from Dr. Cote's report and represents only his opinion rather than market realities. Dr. Cote is not

qualified to provide expert opinion testimony about developing a distributed kit IVD version of an MCED test because he has no experience developing MCED tests at all (*see* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)) or about which NGS platforms are viable for MCED testing because he has never operated an NGS instrument and has no publications related to NGS, among other reasons (*see* Response to RPFF ¶ 1964, below (examining Dr. Cote's lack of qualifications on subject of which NGS platforms are viable for MCED testing)). Dr. Cote is also not credible (*see* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across subjects). In addition, Dr. Cote's opinion about developing distributed kit IVD versions of MCED tests is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight. Therefore, this Court should disregard the proposed finding.

678.1 Illumina has not yet received clearance for NovaSeq Dx system. (Goswami (Illumina) Tr. 3194.) Illumina currently has regulatory clearance in the United States for the NextSeq Dx and MiSeq Dx systems. (Goswami (Illumina) Tr. 3191–92.) [redacted]; Nolan (Freenome) Tr. 2715; PX7112 (Bailey (PGDx) Dep. at 107).)

Response to Finding No. 678.1

[redacted]

[redacted]

[redacted]

678.2 If such developers were to pursue a distributable IVD kitted test for cancer screening, their test would need to be adapted to match the parameters of the NextSeq 550Dx, a system with different specifications from the RUO NovaSeq system. (RX3869 (Cote Expert Report) at 178.) [redacted]

Response to Finding No. 678.2

[redacted]

[redacted]

[redacted]

678.3 Because the evidence suggests that many sequencing platforms suitable for multi-cancer screening will become available in the next 1–2 years, test developers could validate their tests on an alternative NGS platform with regulatory clearance on a similar timeframe as validation on the (future) NovaSeq Dx platform. (RX3869 (Cote Expert Report) at 178.)

Response to Finding No. 678.3

Complaint Counsel objects to the proposed finding because it is vague, against the weight of the evidence, incorrect, and misleading, Dr. Cote is not qualified to offer expert opinion testimony on this subject, Dr. Cote is not credible, and Dr. Cote's opinion is not reliable.

The proposed finding is vague because it does not explain what "suitable" means in this context.

The proposed finding is against the weight of the evidence establishing that sufficient and timely entry of a new sequencing platform suitable for developing and commercializing an MCED test is unlikely. (*See* CCFF ¶¶ 1576-1731; Responses to RPFF ¶¶ 605-644, above). Moreover, there is zero evidence in the record that any new sequencer, much less one suitable for MCED testing, will obtain FDA clearance in the next 1-2 years.

The proposed finding is incorrect because it claims test developers could validate their

tests on an (unidentified) alternative NGS platform with regulatory clearance in a similar timeframe as on the "(future) NovaSeq DX platform." [redacted]

The proposed finding is against the weight of substantial evidence showing that switching to another NGS platform would cause significant delays, require significant costs, and pose regulatory and financial risks for MCED test developers. (*See* CCFF ¶¶ 1768-1901; Responses to RPFF ¶¶ 645-74, above).

The proposed finding is misleading because—like numerous of Respondents' other proposed findings—it is copied and pasted verbatim from Dr. Cote's report (RX3869 (Cote Report) ¶ 362), even though Respondents do not attribute it to Dr. Cote, and represents only his opinion rather than market realities. Dr. Cote is not qualified to provide expert opinion testimony about developing a distributed kit IVD version of an MCED test because he has no experience developing MCED tests at all (*see* Response to RPFF ¶ 1960, below (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)) or about which NGS platforms are viable for MCED testing because he has never operated an NGS instrument and has no publications related to NGS, among other reasons (*see* Response to RPFF ¶ 1964, below (examining Dr. Cote's lack of qualifications on subject of which NGS platforms are viable for MCED testing)). Dr. Cote is also not credible (*see* Response to RPFF ¶ 1959, below (setting forth Dr. Cote's credibility problems across subjects). In addition, Dr. Cote's

opinion about developing distributed kit IVD versions of MCED tests is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight. Therefore, this Court should disregard the proposed finding.

678.4 [redacted] The NovaSeq instrument is a substantial investment. (Goswami (Illumina) Tr. 3189–91.)

Response to Finding No. 678.4

[redacted]

[redacted]

[redacted]

678.5 Most hospitals and independent laboratories would continue using the NextSeq Dx and may elect not to invest in a NovaSeq Dx for around $1 million, especially given the issues in meeting the requisite throughput by pooling samples. (Goswami (Illumina) Tr. 3194–95.) As of 2021, there are nearly 30,000 diagnostic and medical laboratory businesses in the U.S. (RX3174 (IBISWorld).) [redacted]

Response to Finding No. 678.5

[redacted]

[redacted]

[redacted]

[redacted]

V. COMPLAINT COUNSEL FAILED TO PROVE THE REQUISITE ANTITRUST MARKETS

A. The Alleged Relevant Market

1. Speculative and Simultaneously Over- and Under-Inclusive

a. The Alleged Relevant Market is Speculative

679. Complaint Counsel alleges an MCED market consisting of the Galleri test and any other test in development, so long as its developers contend that it will detect more than one cancer type and use NGS, no matter its anticipated features, functions, or launch timeline. (*See* FTC Pretrial Br. at 43–44; Compl. ¶ 3; PX6090 (Scott Morton Expert Report) ¶¶ 141–46.)

Response to Finding No. 679

The proposed finding should be disregarded because it is not a "finding of fact," but rather a legal conclusion in contravention of this Court's order and the Part 3 rules. (*See* 16 C.F.R. § 3.46; Order on Post-Trial Findings). Respondents have merely recited a portion of their own Post-Trial Brief—in effect representing their argument as a "fact." (*See* Resp.'s Post-Trial Brief at 20).

The proposed finding is also misleading, incorrect, and against the weight of the evidence to the extent Respondents allege Complaint Counsel has failed to properly define a relevant product market. [redacted] The appropriateness of this product market is overwhelmingly supported by the weight of the evidence. Evidence shows that MCED tests are not in the same product market as other blood-based oncology tests, like therapy selection, minimal residual disease ("MRD"), or diagnostic aid to cancer ("DAC") tests, because they serve a different function for a patient who cannot reasonably substitute them for an MCED test for

cancer screening. (*See* CCFF ¶¶ 611-33). Existing standard of care cancer screening tests, like mammograms and colonoscopies, are also not in the same product market as MCED tests because they perform a different function—provide a more invasive screen for later-stage, single cancers—and are not reasonable substitutes for an MCED test. (*See* CCFF ¶¶ 635-59). This distinction is even highlighted by Grail's own executives who highlighted that MCED tests are "very much to complement the standard screening approaches that are available today." (PX7103 (Jamshidi (Grail) Dep. at 38-39)). Finally, single-cancer liquid biopsy tests are also not in the same relevant product market as MCED tests because they also serve a different function by testing for more cancers simultaneously, as evidence from Respondents and other MCED developers makes clear. (*See* CCFF ¶¶ 660-87).

Evidence highlighting the competition and substitutability between MCED tests, including competition for pricing, features, testing methods, and accuracy, demonstrate these tests properly comprise a relevant product market. (*See* CCFF ¶¶ 668-830). The evidence clearly demonstrates that MCED developers, including Grail, view MCED tests as their own product market in which their products compete with each other. (*See* CCFF ¶¶ 746-808). Further, application of the *Brown Shoe* factors indicates a relevant product market exists for MCED tests, (*see* CCFF ¶¶ 688-821), as does the Hypothetical Monopolist Test as conducted Complaint Counsel's Expert, Dr. Fiona Scott Morton. (*See* CCFF ¶¶ 822-30).

680. This definition is impermissibly speculative. (PFF ¶¶ 680.1–680.5.)

Response to Finding No. 680

The proposed finding should be disregarded because it is not a "finding of fact," but rather a legal conclusion in contravention of this Court's order and the Part 3 rules (*See* 16 C.F.R. § 3.46; Order on Post-Trial Findings). Respondents have merely represented their own argument as a "fact."

680.1 [redacted] Gao (Singlera) Tr. 2925–26.)

680.5 These "products" cannot be considered substitutes for Galleri. [redacted] 3727, 3777, 3782–83, 3814–15, [redacted]

Response to Finding No. 680.5

[redacted]

[redacted]

[redacted]

681. Numerous fact witnesses testified that the future contours of the MCED field were largely speculative or unknown:

Response to Finding No. 681

The proposed finding is unsupported because no evidence is cited for the factual proposition. The proposed finding is also vague and ambiguous because it refers to "numerous" fact witnesses without ***any*** witnesses and refers to the "future contours of the MCED field" without defining or otherwise provide any explanation of the MCED field. The proposed finding is also unsupported because no evidence is cited for the factual proposition. Therefore, this Court should disregard the proposed finding.

681.1 [redacted]

Response to Finding No. 681.1

[redacted]

[redacted]

[redacted]

[redacted]

681.2 [redacted]

Response to Finding No. 681.2

[redacted]

[redacted]

[redacted]

[redacted]

681.3 Dr. William Cance, Chief Medical Officer of the American Cancer Society, said it "would be very hard to even speculate" on how long it will be before there is a blood-based test that's sensitive and specific enough to replace the standard of care cancer screens available today. (PX7086 (Cance (ACS) Dep. at 51).)

Response to Finding No. 681.3

The proposed finding is misleading to the extent it is intended to imply that Dr. Cance testified that the MCED market is speculative. Dr. Cance was simply explaining it was speculative say when MCED tests would replace standard of care tests versus opining on the stage of any particular competitors or the market generally. (PX7086 (Cance (ACS) Dep. at 51). Indeed, Dr. Cance named Grail, Exact, and Freenome as some of the companies developing MCED tests in the United States. (Cance, Tr. 611-12). Therefore, this Court should disregard the proposed finding.

681.4 Quest's Kristie Dolan testified that "the field is too nascent to say with any level of specificity" whether MCED tests would compete with each other in the absence of identical capabilities. (PX7116 (Dolan (Quest) Dep. at 106).)

Response to Finding No. 681.4

The proposed finding is unreliable, misleading, against the weight of the evidence to the extent Respondents are suggesting MCED tests will not compete with each other in the future. The proposed finding is unreliable and misleading because the witness, Kristie Dolan from Quest Diagnostics, lacks the relevant experience and perspective to have the foundation to provide a probative opinion on competition in the MCED market. [redacted]

[redacted]

[redacted]

[redacted]

[redacted] Therefore, this Court should disregard the proposed finding.

682. Because the proposed market does not exist, Complaint Counsel's economic expert admitted that she did not and could not consider any real world evidence regarding the pricing of MCED tests:

Response to Finding No. 682

The proposed finding is vague, confusing, unsupported, unreliable, incomplete, misleading, and incorrect. The proposed finding is vague and confusing because Respondents have not defined "real world evidence" or explained how that evidence relates to the "pricing" of MCED tests. Further, Respondents have not provided a single citation in support of their fact, thus rendering it unreliable, incomplete, and misleading. To the extent Respondents imply Complaint Counsel's expert, Dr. Fiona Scott Morton, did not support her conclusions with evidence about the MCED market from the evidentiary record, this finding is entirely incorrect as her report is replete with citations to testimony and documents from third parties and the parties discussing the MCED market. Therefore, this Court should disregard the proposed finding.

682.1 [redacted]

Response to Finding No. 682.3

[redacted]

[redacted]

682.4 [redacted]

Response to Finding No. 682.4

[redacted]

[redacted]

682.5 "Q. In forming your opinions, is it accurate to say that you did not consider data describing the past purchase patterns of consumers in their responses to price changes for MCED tests? A. As I have said, the MCED test was only launched a couple of months ago. We don't really have a setting in which consumers can do anything except [buy] Galleri in an uninsured fashion." (RX3852 (Scott Morton Dep. at 19).)

Response to Finding No. 682.5

[redacted]

[redacted]

683.

Response to Finding No. 683

[redacted]

683.1 She also did not attempt to fill the information gaps using surveys or other means, including information about the likely preferences and potential switching behavior of clinicians, patients, and payors related to the products she includes and excludes from her proposed MCED market. (RX6004 (Katz Trial Dep. at 17–22).)

Response to Finding No. 683.1

The proposed finding misrepresents Dr. Scott Morton's analysis. [redacted] The proposed finding is misleading to the extent it implies that an analysis of survey data is necessary to define the market. As Complaint Counsel explained in its Post-Trial Reply Brief, Congress prescribed a pragmatic, factual approach to the definition of the relevant market and not a formal, legalistic one. This is because the market, as most concepts in law or economics cannot be measured by metes and bounds. (Complaint Counsel's Post-Trial Reply Brief at Section I.). Moreover, the weight of the evidence – including the analysis of Dr. Scott Morton – shows that MCED tests are a relevant market. (CCFF § 3), *see also*, (Complaint Counsel's Post-Trial Reply Brief at Section I.B.).

683.2 Nor did she attempt to analyze likely substitution from the perspective of payors, despite acknowledging that payor choices will drive adoption of different screening tests. (RX6004 (Katz Trial Dep. at 17–22).)

Response to Finding No. 683.2

[redacted]

[redacted]

684. The evidence in the record demonstrates is that it is unlikely customers (*i.e.*, patients, doctors and payors) will view the products in development as substitutes with Galleri. (PFF ¶¶ 684.1–684.3.)

Response to Finding No. 684

[redacted]

CCFF ¶ 2426). Respondents own ordinary course documents analyze those core features and identify Grail's competitors today and those that it anticipates being substitutes in the future. *See, e.g.*, (CCFF, ¶¶ 2231-3284; 3294-3307; 3319-3325; 3335-3350; 3358-3361; 3370-3375; 3381-3384; 3395-3388; 3389-3393; 3424-3468; 3471-3492). Therefore, this Court should

disregard the proposed finding.

684.1 None of the tests in development has demonstrated the capability to detect 50 cancers. (*See* Lengauer (Exact/Thrive) Tr. 243, 260–61; [redacted] Gao (Singlera) Tr. 2874–75.)

Response to Finding No. 684.1

[redacted]

[redacted]

[redacted]

[redacted]

684.2 Nor has any test in development demonstrated the ability to identify cancer signal of origin without the aid of a PET-CT scan. (Lengauer (Exact/Thrive) Tr. 246–48; [redacted]); RX3115 (Chen et al 2020) at 6.)

Response to Finding No. 684.2

[redacted]

[redacted]

684.3 Determining the boundaries of Complaint Counsel's alleged market depends on a comparison to, or of, one or more non-existent tests. ([redacted]; Gao (Singlera) Tr. 2925–26.)

Response to Finding No. 684.3

[redacted]

[redacted]

685. As Dr. Katz testified, "[t]he timing of when [putative MCED developers are] going to actually have commercial products and when they're going to launch them and ultimately when [they are] going to get insurance coverage so that they have a chance of significant competitive success, . . . is highly uncertain and it's in the future." (RX6004 (Katz Trial Dep. at 34–35).)

Response to Finding No. 685

[redacted]

[redacted]

[redacted]

b. Simultaneously Over- and Under-Inclusive

686. [redacted] (Bishop (GRAIL) Tr. 1373–74; RX0744 (GRAIL) slide 22, 100.)

Response to Finding No. 686

[redacted]

[redacted]

[redacted]

687. [redacted]

[redacted] RX6004 (Katz, Trial Dep. at 30 ("[I] t's counterintuitive that a test, say, for testicular cancer should be out of the market because it's not a close enough substitute to a test that [detects] testicular cancer *and* prostate cancer" but that two hypothetical tests that detect "two completely nonoverlapping" cancer types are included "because they each do two").)

Response to Finding No. 687

[redacted]

[redacted]

688. In addition to clearly not being substitutes for *Galleri*, many of the tests in Complaint Counsel's proposed market are also not even substitutes with *each other*. (*See* RX6004 (Katz Trial Dep. at 29).)

Response to Finding No. 688

The proposed finding is only supported by improper expert testimony and should be disregarded in its entirety. This Court ordered Dr. Katz to confine his opinions to the opinions and bases for those opinions contained in Dr. Willig's expert witness report. (Order Granting Respondents' Motion for Leave to Substitute a Replacement Expert Witness, 4 ("The substitute expert witness' trial testimony shall be limited to the opinions, bases or reasons therefor, and the data or other information considered or relied upon by Dr. Willig, as set forth in Dr. Willig's expert witness report."); [redacted] Dr. Katz's cited opinion does not appear to be contained in Dr. Willig's report in violation of this Court's order.

Complaint Counsel objects to Respondents proposed finding to the extent it endorses the biased and inherently unreliable opinion testimony of Dr. Katz. Dr. Katz normally spends approximately three to four hundred hours preparing for an expert report in a matter. (RX6004 (Katz Trial Dep. at 135-136)). Here, Dr. Katz only billed forty to fifty hours. (RX6004 (Katz Trial Dep. at 137)). In total, Dr. Katz allegedly considered over 6,533 pages of material in approximately forth to fifty hours. (RX6004 (Katz Trial Dep. at 137-141)). In effect, this means that he spent approximately less than half a minute per page in reviewing the materials listed on his materials considered list. (PX6105 (Katz Expert Report) at 017-023). Given his cursory review of the record, his opinion in this case is inherently unreliable and should be disregarded.

Moreover, Dr. Katz violated this Court's order to confine his testimony to Dr. Willig's report and the basis for his opinion contained therein. (Order Granting Respondents' Motion for Leave to Substitute a Replacement Expert Witness, 4 ("The substitute expert witness' trial testimony shall be limited to the opinions, bases or reasons therefor, and the data or other information considered or relied upon by Dr. Willig, as set forth in Dr. Willig's expert witness report."); [redacted] (Dr. Katz's materials considered lists three academic articles, six Illumina documents, three Grail documents, rebuttal report of Dr. Fiona Scott Morton as well as her trial testimony in reaching his initial conclusions that Dr. Willig did not cite nor list in his materials considered.) Given the unreliable nature of Dr. Katz's opinion as well as Respondents' complete disregard of this Court's order, Dr. Katz's opinion should be disregarded.

Moreover, this finding is misleading. Respondents, however, do not specify which tests Dr. Katz is referring to and only mention a hypothetical postulated by their expert which appears unbased in the evidence of MCED test developers current or future plans. Finally, the proposed finding is irrelevant. [redacted]. Respondents yet again distract with the wrong question. The relevant antitrust question is not the competitiveness of the market participants with each other but rather their competitiveness with Grail. (*See* Complaint Counsel's Post-Trial Reply Brief at 24-28).

689. Complaint Counsel's proposed market would include any test that screens for two or more cancer types, even though that would necessarily group together screening tests that detect distinct cancer types in different populations. (*E.g.*, PX6090 (Scott Morton Expert Report) ¶¶ 141–42.)

Response to Finding No. 689

[redacted]

690. As Dr. Katz testified: "suppose we have two tests, one of which covers testicular cancer and prostate cancer . . . and then we have another one that does uterine cancer and ovarian cancer. It's really difficult for me to see how those could be substitutes for one another. I believe they're not. And I think that shows a fundamental defect in [Complaint Counsel's proposed] market." (RX6004 (Katz Trial Dep. at 29).)

Response to Finding No. 690

The proposed finding is based on improper expert opinion testimony and against the weight of the evidence. This Court ordered Dr. Katz to confine his opinions to the opinions and bases for those opinions contained in Dr. Willig's expert witness report. (Order Granting Respondents' Motion for Leave to Substitute a Replacement Expert Witness, 4 ("The substitute

expert witness' trial testimony shall be limited to the opinions, bases or reasons therefor, and the data or other information considered or relied upon by Dr. Willig, as set forth in Dr. Willig's expert witness report."); [redacted] Dr. Katz's cited opinion does not appear to be contained in Dr. Willig's report based on the proposed fact in violation of this Court's order and should be disregarded in its entirety.

Complaint Counsel also objects to Respondents proposed finding to the extent it endorses the biased and inherently unreliable opinion testimony of Dr. Katz. Dr. Katz normally spends approximately three to four hundred hours preparing for an expert report in a matter. (RX6004 (Katz Trial Dep. at 135-136)). Here, Dr. Katz only billed forty to fifty hours. (RX6004 (Katz Trial Dep. at 137)). In total, Dr. Katz allegedly considered over 6,533 pages of material in approximately forth to fifty hours. (RX6004 (Katz Trial Dep. at 137-141)). In effect, this means that he spent approximately less than half a minute per page in reviewing the materials listed on his materials considered list. (PX6105 (Katz Expert Report) at 017-023). Given his cursory review of the record, his opinion in this case is inherently unreliable and should be disregarded. Moreover, Dr. Katz violated this Court's order to confine his testimony to Dr. Willig's report and the basis for his opinion contained therein. (Order Granting Respondents' Motion for Leave to Substitute a Replacement Expert Witness, 4 ("The substitute expert witness' trial testimony shall be limited to the opinions, bases or reasons therefor, and the data or other information considered or relied upon by Dr. Willig, as set forth in Dr. Willig's expert witness report."); [redacted] (Dr. Katz's materials considered lists three academic articles, six Illumina documents, three Grail documents, rebuttal report of Dr. Fiona Scott Morton as well as her trial testimony in reaching

his initial conclusions that Dr. Willig did not cite nor list in his materials considered.) Given the unreliable nature of Dr. Katz's opinion as well as Respondents' complete disregard of this Court's order, Dr. Katz's opinion should be disregarded.

Finally, the proposed finding is against the weight of the evidence. As Complaint Counsel's Post-Trial Reply Brief outlines, Complaint Counsel has met its burden to prove a relevant market. (Complaint Counsel's Post-Trial Reply Brief at Section I.). Dr. Katz's assertion to the contrary is based on improper hypothetical unsupported by the realities of the market. Respondents do not point to any MCED test developers that intend to only commercialize MCED tests that meet Dr. Katz hypothetical. [redacted] Therefore, this Court should disregard the proposed finding.

> 690.1 Dr. Katz also testified that by defining the market to include tests that cannot be shown to be substitutes for Galleri or each other, Complaint Counsel's proposed market violates the narrowest market rule: "[Dr. Scott Morton] did not attempt to define the narrowest relevant market . . . that would pass the hypothetical [monopolist] test, and I believe this is a fact, that she did not explain or offer a justification for why that would be appropriate. And that's not something that's relying on testimony by other people. It's a failure of the logic and the form of analysis that she's applied." (RX6004 (Katz Trial Dep at 165–66).)

Response to Finding No. 690.1

The proposed finding is based on improper expert opinion testimony and against the weight of the evidence. This Court ordered Dr. Katz to confine his opinions to the opinions and bases for those opinions contained in Dr. Willig's expert witness report. (Order Granting Respondents' Motion for Leave to Substitute a Replacement Expert Witness, 4 ("The substitute

expert witness' trial testimony shall be limited to the opinions, bases or reasons therefor, and the data or other information considered or relied upon by Dr. Willig, as set forth in Dr. Willig's expert witness report."); [redacted] Dr. Katz's cited opinion does not appear to be contained in Dr. Willig's report as the proposed finding does not cite to any section of Dr. Willig's report and violates this Court's order and should be disregarded in its entirety.

Complaint Counsel also objects to Respondents proposed finding to the extent it endorses the biased and inherently unreliable opinion testimony of Dr. Katz. Dr. Katz normally spends approximately three to four hundred hours preparing for an expert report in a matter. (RX6004 (Katz Trial Dep. at 135-136)). Here, Dr. Katz only billed forty to fifty hours. (RX6004 (Katz Trial Dep. at 137)). In total, Dr. Katz allegedly considered over 6,533 pages of material in approximately forth to fifty hours. (RX6004 (Katz Trial Dep. at 137-141)). In effect, this means that he spent approximately less than half a minute per page in reviewing the materials listed on his materials considered list. (PX6105 (Katz Expert Report) at 017-023). Given his cursory review of the record, his opinion in this case is inherently unreliable and should be disregarded. Moreover, Dr. Katz violated this Court's order to confine his testimony to Dr. Willig's report and the basis for his opinion contained therein. (Order Granting Respondents' Motion for Leave to Substitute a Replacement Expert Witness, 4 ("The substitute expert witness' trial testimony shall be limited to the opinions, bases or reasons therefor, and the data or other information considered or relied upon by Dr. Willig, as set forth in Dr. Willig's expert witness report."); [redacted] (Dr. Katz's materials considered lists three academic articles, six Illumina documents, three Grail documents, rebuttal report of Dr. Fiona Scott Morton as well as her trial testimony in reaching

his initial conclusions that Dr. Willig did not cite nor list in his materials considered.) Given the unreliable nature of Dr. Katz's opinion as well as Respondents' complete disregard of this Court's order, Dr. Katz's opinion should be disregarded.

Moreover, Dr. Katz misstates the record in this case. Complaint Counsel did consider whether MCED tests were reasonably interchangeable. Complaint Counsel assessed the shared characteristics and uses of MCED tests that set them apart from other oncology tests; assessed whether MCED tests collectively are designed to target unique customers; and assessed whether MCED tests will have a distinct pricing apart from other oncology tests; and assessed industry recognition of MCEDs collectively. (Complaint Counsel's Post-Trial Brief at 57-63). Moreover, Dr. Katz misapplies the narrowest market principle. From the outset, the narrowest market principle can be helpful but is not required under the Horizontal Merger Guidelines. (PX7132, Willig Dep. 108). [redacted] Finally, Dr. Katz's unsupported, biased, and improper opinion is contravened by the weight of the evidence in this case that shows robust competition in this market. *See, e.g.*, [redacted] Therefore, this Court should disregard the proposed finding.

691. At the same time, Complaint Counsel's proposed market is also under-inclusive, because it excludes MCED tests that are not based on NGS technology.

Response to Finding No. 691

The proposed finding should be disregarded because it is not a "finding of fact," but rather a legal conclusion in contravention of this Court's order and the Part 3 rules. (*See* 16 C.F.R. § 3.46; Order on Post-Trial Findings). Respondents have merely recited a portion of their

own Post-Trial Brief—in effect representing their argument as a "fact." (*See* Resp.'s Post-Trial Brief at 027). Moreover, Complaint Counsel has properly defined the market as explained in its Post-Trial Reply Brief. (Complaint Counsel's Post-Trial Reply Brief at Section I.).

692. It is undisputed that there are at least two MCED tests on the market that are not based on NGS technology. (PFF ¶¶ 692.1–692.2.)

Response to Finding No. 692

The proposed finding is unambiguously incorrect and should be wholly disregarded. Respondents cite to two of its own findings to support this alleged fact, yet neither reliably supports the assertion they make. As explained in the response below, [redacted] Further, Respondents' reliance on the second finding (PFF ¶ 692.2) also proves entirely uncredible. (*See* Response to RPFF ¶ 692.1, below). For this second finding, Respondents have only cited hearsay and their own expert report, in direct violation of the Court's order prohibiting the use of expert testimony to support factual assertions, thus rending this fact also unreliable and incorrect. Accordingly, this proposed finding should be disregarded as entirely incorrect, unreliable, and against the weight of the evidence.

692.1 StageZero's Aristotle test is a microarray-based liquid biopsy test that interrogates mRNA to detect 10 cancers. (Cote Tr. 3875–76; RX3171 (Dempsey et al., 2020); RX3869 (Cote Expert Report) ¶ 248.)

Response to Finding No. 692.1

This proposed finding should be wholly disregarded because it is entirely incorrect, against the weight of the evidence, and in direct violation of the Court's order prohibiting the use of expert testimony to support factual assertions. [redacted]

[redacted]

The finding is also misleading and vague because Respondents have not defined a "liquid biopsy test" or whether they're referring to an MCED cancer screening test. Furthermore, Respondents have relied exclusively on its own expert, Dr. Richard Cote, and an outdated article pulled from the internet to support this alleged finding despite having deposed a StageZero witness. This violation of the Court's order barring the use of expert testimony "to support factual propositions that should be established by fact witnesses or documents" also highlights more generally why Dr. Cote's opinions should `not be afforded any weight. (*See* Order on Post-Trial Briefing at 3). Dr. Cote is not qualified to provide expert opinion testimony about which NGS platforms are viable for MCED testing, because he has never operated an NGS instrument and has no publications related to NGS, among other reasons. (*See* Response to RPFF ¶ 1964, below (examining Dr. Cote's lack of qualifications on subject of which NGS platforms are viable for MCED testing)). As an unsupported and incorrect finding that unquestionably violates the Court's explicit order, this fact should be wholly disregarded.

692.2 Genesys Biolabs' OneTest is a proteomics-based test that measures seven cancer protein biomarkers to screen for lung, liver, pancreatic, ovarian, prostate and colon cancers. (RX3259 (Genesys Biolabs); RX3869 (Cote Expert Report) ¶ 253.)

Response to Finding No. 692.2

This proposed finding should be wholly disregarded because it relies on hearsay and

evidence that is in direct violation of the Court's order prohibiting the use of expert testimony to support factual assertions. Respondent's first citation, a two-page article tagged RX3259 that they allege was collected from Genesys Biolabs according to the citation, was printed from the internet and lacks any information identifying its source. Further, the article cited (RX3259) does not mention the word proteomics or provide any information whatsoever about the platform of the test being discussed, let alone mention any connection to Genesys Biolabs. Respondents had ample opportunity to collect evidence from Genesys Biolabs, including issuing a subpoena to depose a relevant witness, yet failed to do so. Instead, Respondents have simply printed an article online and seek to admit evidence based on blatant hearsay.

As an alternative, Respondents have relied on the expert report of Dr. Richard Cote to support this assertion—a direct violation of the Court's order barring the use of expert testimony "to support factual propositions that should be established by fact witnesses or documents." (*See* Order on Post-Trial Briefing at 3). Dr. Cote is not qualified to provide expert opinion testimony about which NGS platforms are viable for MCED testing, because he has never operated an NGS instrument and has no publications related to NGS, among other reasons. (*See* Response to RPFF ¶ 1964, below (examining Dr. Cote's lack of qualifications on subject of which NGS platforms are viable for MCED testing)). As an unsupported and incorrect finding that unquestionably violates the Court's explicit order, this fact should be wholly disregarded.

693. Moreover, a number of companies are developing cancer screening tests that are not based on NGS technology, including tests in development from InterVenn Biosciences, PrognomiQ and Somalogic. (Leite (Illumina/InterVenn) Tr. 2171–74; RX3587 (PrognomiQ) at 2; RX3651 (Somalogic) at 1–7; RX3869 (Cote Expert Report) ¶¶ 247–67.)

Response to Finding No. 693

The proposed finding should be disregarded as impermissibly vague, misleading, unsupported, unreliable, and against the weight of the evidence. The proposed finding is vague

and misleading because Respondents state companies are developing "cancer screening tests" without specifying if these companies are developing MCED tests. In fact, Respondents only cite to evidence produced from one of these companies, testimony from InterVenn's John Leite, who explicitly testified that InterVenn is not developing an MCED test and is only developing single-cancer tests. (Leite (Illumina/InterVenn) Tr. 2178-81). For the other two companies, PrognomiQ and Somalogic, Respondents impermissibly rely on printed versions of website—unquestionably hearsay—and the expert report of Richard Cote. On top of being hearsay, the websites cited, RX3587 for PrognomiQ and RX3651 for Somalogic, don't even provide sufficient information about the design or platform for a cancer screening test, let alone whether these alleged cancer screening tests are MCED tests. Citations to Dr. Cote's report is in direct contravention of the Court's order barring the use of expert testimony "to support factual propositions that should be established by fact witnesses or documents," (*see* Order on Post-Trial Briefing at 3), and thus this finding should be wholly disregarded as unsupported and unreliable. Dr. Cote is also not qualified to provide expert opinion testimony about which NGS platforms are viable for MCED testing, because he has never operated an NGS instrument and has no publications related to NGS, among other reasons. (*See* Response to RPFF ¶ 1964, below (examining Dr. Cote's lack of qualifications on subject of which NGS platforms are viable for MCED testing)).

The proposed finding is also against the weight of evidence that shows industry participants, including [redacted], repeatedly affirming Illumina's NGS platform is the only option for MCED developers. (*See* CCFF ¶¶ 1053-211). Further, the proposed finding is also vague and misleading because Respondents state "a number of companies" without quantifying a number or clarifying what they mean. Not only have Respondents failed to

provide reliable information about the three companies they mention in this finding, but they have similarly provided incorrect findings about [redacted] (*see* Response to RPFF ¶ 692.1), and a wholly unsupported finding about Genesys. (*See* Response to RPFF ¶ 692.2). As an unsupported and incorrect finding that unquestionably violates the Court's explicit order, this fact should be wholly disregarded.

693.1 These tests are too undeveloped to be included in a relevant market with Galleri. (Leite (Illumina/InterVenn) Tr. 2171–74; RX3587 (PrognomiQ) at 2; RX3651 (Somalogic) at 1–7.)

Response to Finding No. 693.1

The proposed finding should be disregarded because it is not a "finding of fact," but rather a legal conclusion in contravention of this Court's order and the Part 3 rules. (*See* 16 C.F.R. § 3.46; Order on Post-Trial Findings). Respondents have merely recited a portion of their own Post-Trial Brief—in effect representing their argument as a "fact." (*See* Resp.'s Post-Trial Brief at 28). Further, this proposed finding is impermissibly vague and misleading because Respondents have not defined "these tests" or provided sufficient information to understand their alleged "fact." To the extent Respondents are referring to tests alleged in development by InterVenn, PrognomiQ, and Somalogic, Respondents have failed to identify if these "tests' are in fact MCED tests. (*See* Response to RPFF ¶ 693). As such, and without more information, this proposed finding should be wholly disregarded as impermissibly vague, confusing, and entirely unsupported.

694. There is no evidence, or reason to believe, that an MCED test must use NGS technology to compete with GRAIL. (*See* Cance (ACS) Tr. 606; Cote Tr. 3729–30, 3736–37, 3872; RX3869 (Cote Expert Report) ¶ 75.)

Response to Finding No. 694

[redacted]

[redacted]

695. Nor is there any evidence, or reason to believe, that patients or doctors have any preference for an MCED test based on the platform used to run it. (*See, e.g.*, RX3852 (Scott Morton Dep. at 51).)

Response to Finding No. 695

The proposed finding misstates Dr. Scott Morton's testimony. Dr. Scott Morton actually testified that MCED tests are "broadly equivalent and there's gonna be a marketplace with multiple competitors in it, but all are going to meet this threshold of saving lives in the same

way." (RX3952 (Dr. Scott Morton Dep. at 51-52). [redacted] Further, the proposed finding is misleading to the extent that it implies that MCED test developers are not reasonable substitutes or that MCED test developers are not dependent on NGS platforms for the research, development, and commercialization of MCED tests. *See* Complaint Counsel Post-Trial Brief § II(E). Therefore, this Court should disregard the proposed finding.

696. What patients and doctors care about is whether a test works and for which indications, not how exactly it works. (*See, e.g.*, RX3852 (Scott Morton Dep. at 51) ("[U]ltimately the patient and the doctor are going to care about the ability of the test to prevent the disease and save lives.").)

Response to Finding No. 696

The proposed finding is misleading to the extent Respondents are implying that MCED test developers are not dependent on NGS sequencers for the research, development, and commercialization of MCED tests. [redacted] *see also*, Complaint Counsel's Post-Trial Brief at 68-79. Therefore, this Court should disregard the proposed finding.

2. **No Reasonable Interchangeability**

697. Not on the Market. At present, there is no product in existence that is reasonably interchangeable with GRAIL's Galleri test. (Bishop (GRAIL) Tr. 1401.)

Response to Finding No. 697

The proposed finding is vague, confusing, unsupported, against the weight of the evidence, misleading, incorrect, unreliable, and relies on self-serving testimony. The proposed finding is vague and confusing because Respondents have not identified what it means to be a "product in existence" or "reasonably interchangeable." To the extent the proposed finding

suggests there is no MCED test in development that is "reasonably interchangeable" with Grail's Galleri this finding is unsupported, misleading, against the weight of the evidence, and incorrect. There are numerous MCED test developers currently developing MCED tests that compete with Grail's Galleri, (*see* CCFF § VI), [redacted] Even Grail's former CEO, Hans Bishop—who Respondents cite to support this assertion—testified that there are several companies who have indicated an intent to develop a multicancer test, including Exact, Thrive, Guardant, Singlera, and Burning Rock. (CCFF ¶¶ 3200). The proposed finding is also unreliable because Respondents have only relied on the self-serving testimony of its own executive, Grail's former CEO Hans Bishop, who merely testified about his own views. The testimony that Respondents cite merely says that, "in his view," Mr. Bishop did not believe "Grail is competing today against any of these companies" that Respondent's counsel had asked him about. (*See* Bishop (GRAIL) Tr. 1401). [redacted] In the testimony cited, Mr. Bishop also never uses the term "reasonably interchangeable," which is a legal term that Respondents' counsel have tried to incorporate into his unrelated testimony. (*See* Bishop (GRAIL) Tr. 1401). Therefore, this Court should disregard the proposed finding.

698. Galleri is the only multi-cancer early detection test testing for anywhere near 50 cancer types on the market. (Bishop (GRAIL) Tr. 1401, [redacted]); Ofman (GRAIL) Tr. 3308; RX3852 (Scott Morton Dep. at 53); (Cance (ACS) Tr. 632–33).)

Response to Finding No. 698

[redacted]

[redacted]

[redacted]

[redacted]

699. Indeed, the prices and qualities of these yet-to-exist products are not even specified. (*See* PFF ¶¶ 750.1–750.4.)

Response to Finding No. 699

The proposed finding should be disregarded as impermissibly vague, misleading, unsupported, and thus unreliable. Respondents have failed to define "yet-to-exist products," much less "prices and qualities" of these undefined products, and have also provided no context

to understand their reference to "not even specified." Without defining or explaining any of these terms or references, the proposed finding is vague and misleading. As such, the proposed finding is similarly unsupported and unreliable. The proposed finding should thus be wholly disregarded.

700. Years Away. Most of the putative MCED developers identified by Complaint Counsel do not expect (and none can reasonably be expected) to launch a screening test for more than one cancer for many years. (PFF ¶¶ 701–706.)

Response to Finding No. 700

The proposed finding is vague, misleading, incomplete, incorrect, and against the weight of the evidence. The proposed finding is impermissibly vague and misleading because Respondents have made no effort to identify any specific MCED developers and have instead relied on vague language that says merely "*most* of the putative MCED developers" and "*many* years." These are subjective terms that do not provide sufficient support to provide anything probative. Without more information, this proposed finding is incomplete and not an alleged "fact."

706. Singlera. Singlera is "far, far away" from launching its PanSeer test. (PX7102 (Gao (Singlera) Dep. at 118–19).)

Response to Finding No. 706

This proposed finding is vague, misleading, and against the weight of the evidence. This finding is vague and misleading because Respondents have not defined "far, far away" or what that means. This is a subjective term yet Respondents have cited it as fact.

Further, the proposed finding is misleading and against the weight of the evidence to the extent Respondents imply Singlera is not actively developing its PanSeer MCED test. Singlera has already completed a proof-of-concept study of its PanSeer test in China on 100,000 people, called the Taizhou Longitudinal Study, identifying lung, esophageal, liver, colorectal, and gastric cancers at least four years before conventional diagnosis. (PX7042 (Gao (Singlera) IHT at 28-30); *see also* Gao (Singlera) Tr. 2878-79). Singlera's PanSeer MCED test is designed to detect all kinds of cancer, and not just the five cancers used in the Taizhou Longitudinal Study, with the goal of offering a "pan-cancer" test. (Gao (Singlera) Tr. 2881). Singlera has already invested between $60-100 million on the development of the PanSeer MCED test and expects to launch it

as an FDA approved test by 2028. (Gao (Singlera) Tr. 2888-89; PX7042 (Gao (Singlera) IHT at 96)).

[redacted]

706.1 Singlera does not plan on marketing its PanSeer test in the US until it has received FDA approval. (Gao (Singlera) Tr. 2873.)

Response to Finding No. 706.1

The proposed finding is misleading and against the weight of the evidence to the extent Respondents imply Singlera is not actively developing its PanSeer MCED test. Singlera has already completed a proof-of-concept study of its PanSeer test in China on 100,000 people, identifying lung, esophageal, liver, colorectal, and gastric cancers at least four years before conventional diagnosis. (PX7042 (Gao (Singlera) IHT at 28-30); *see also* Gao (Singlera) Tr. 2878-79). Singlera's PanSeer MCED test is designed to detect all kinds of cancer, and not just the five cancers used in the Taizhou Longitudinal Study, with the goal of offering a "pan-cancer" test. (Gao (Singlera) Tr. 2881). Singlera has already invested between $60-100 million on the

development of the PanSeer MCED test and expects to launch it as an FDA approved test by 2028. (Gao (Singlera) Tr. 2888-89; PX7042 (Gao (Singlera) IHT at 96)).

[redacted]

706.2 Singlera is not currently in talks with the FDA. (Gao (Singlera) Tr. 2926–27).

Response to Finding No. 706.2

This proposed finding is incorrect, misleading, and against the weight of the evidence. Dr. Gao clearly testified in the testimony that Respondents cite that Singlera is in discussions with the FDA about its ColonES test. (Gao (Singlera) Tr. 2926–27). The proposed finding is also misleading and vague because it does not explain what it means to be "in talks with the FDA" or its relevance for obtaining FDA approval.

Further, the proposed finding is misleading and against the weight of the evidence to the extent Respondents imply Singlera is not actively developing its PanSeer MCED test. Singlera has already completed a proof-of-concept study of its PanSeer test in China on 100,000 people,

called the Taizhou Longitudinal Study, identifying lung, esophageal, liver, colorectal, and gastric cancers at least four years before conventional diagnosis. (PX7042 (Gao (Singlera) IHT at 28-30); *see also* Gao (Singlera) Tr. 2878-79). Singlera's PanSeer MCED test is designed to detect all kinds of cancer, and not just the five cancers used in the Taizhou Longitudinal Study, with the goal of offering a "pan-cancer" test. (Gao (Singlera) Tr. 2881). Singlera has already invested between $60-100 million on the development of the PanSeer MCED test and expects to launch it as an FDA approved test by 2028. (Gao (Singlera) Tr. 2888-89; PX7042 (Gao (Singlera) IHT at 96)).

[redacted]

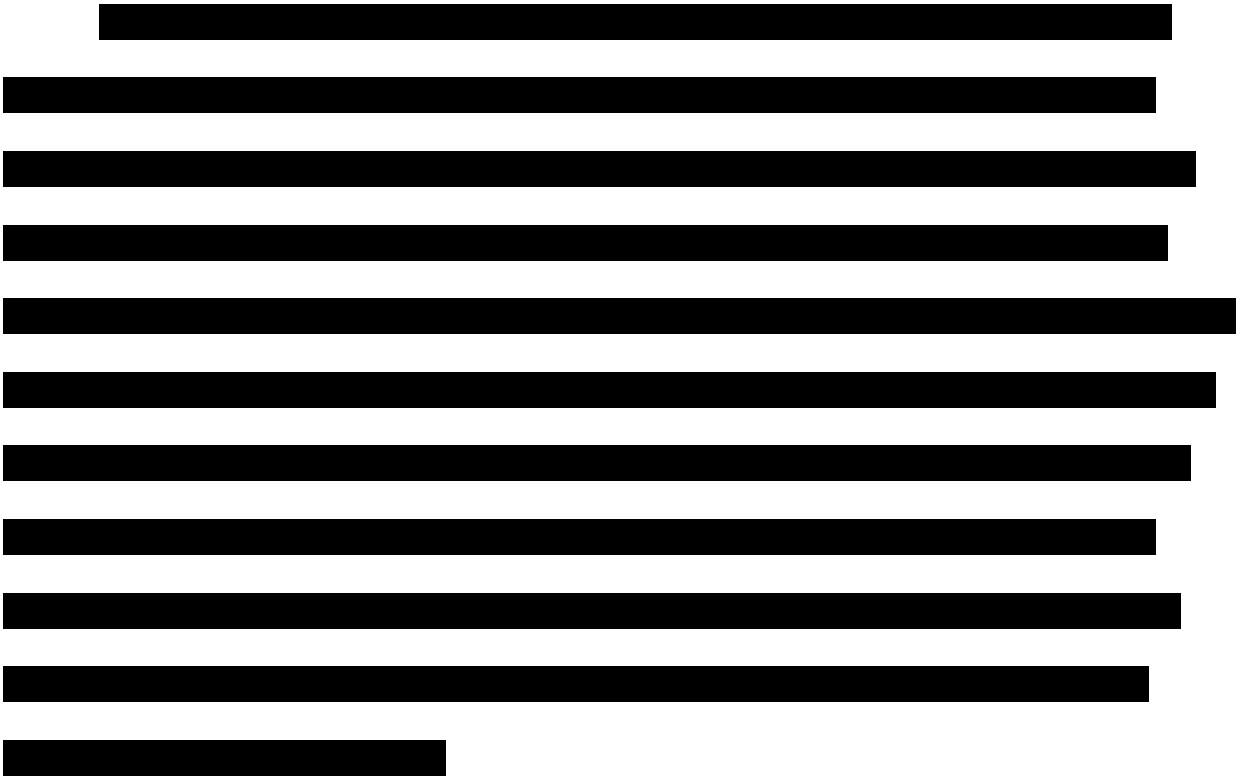
706.3 It will "take at least seven to ten years of time for [the current PanSeer] test to be able to go to FDA". (Gao (Singlera) Tr. 2891).

Response to Finding No. 706.3

The proposed finding is vague, misleading, and against the weight of the evidence. The proposed finding is vague and misleading because Respondents have not explained what it

means to "be able to go to FDA."

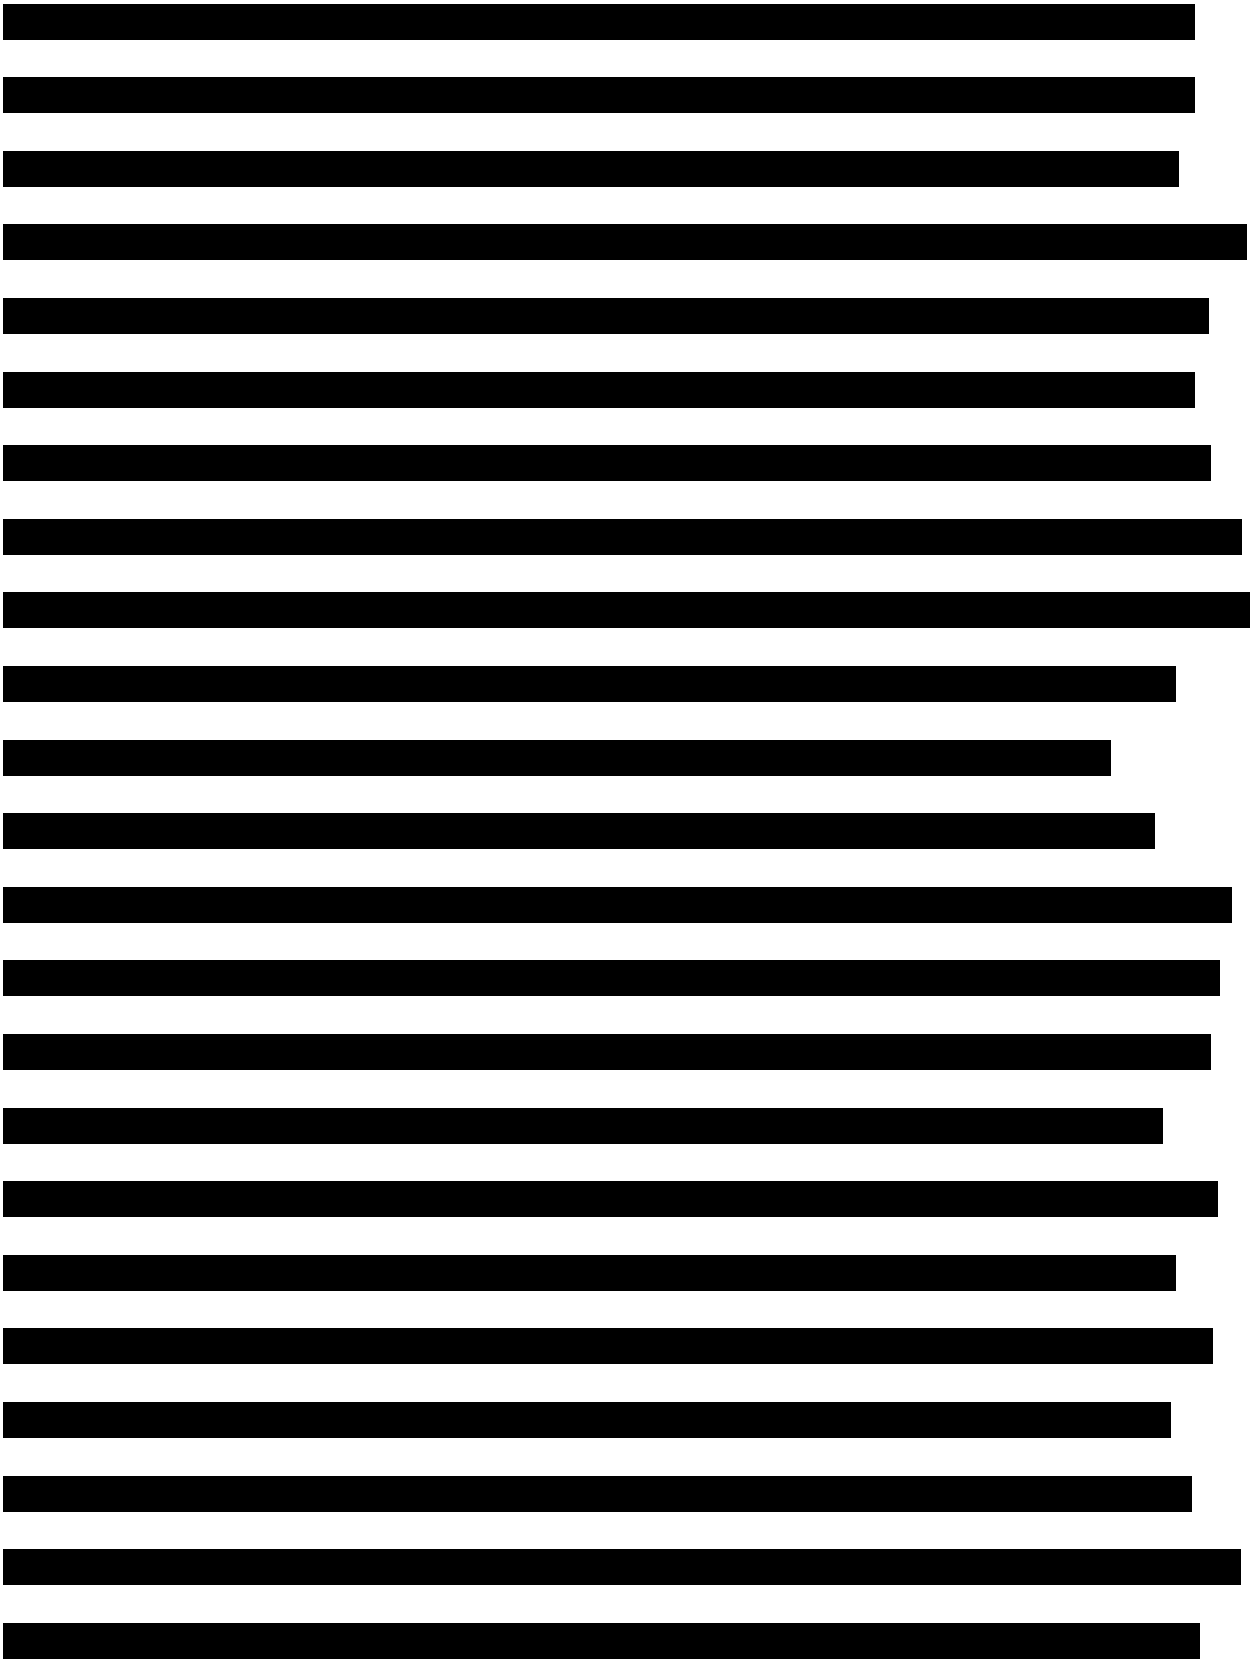
Further, the proposed finding is misleading and against the weight of the evidence to the extent Respondents imply Singlera is not actively developing its PanSeer MCED test. Singlera has already completed a proof-of-concept study of its PanSeer test in China on 100,000 people, called the Taizhou Longitudinal Study, identifying lung, esophageal, liver, colorectal, and gastric cancers at least four years before conventional diagnosis. (PX7042 (Gao (Singlera) IHT at 28-30); *see also* Gao (Singlera) Tr. 2878-79). Singlera's PanSeer MCED test is designed to detect all kinds of cancer, and not just the five cancers used in the Taizhou Longitudinal Study, with the goal of offering a "pan-cancer" test. (Gao (Singlera) Tr. 2881). Singlera has already invested between $60-100 million on the development of the PanSeer MCED test and expects to launch it as an FDA approved test by 2028. (Gao (Singlera) Tr. 2888-89; PX7042 (Gao (Singlera) IHT at 96)).



707. These far-off projections are consistent with other record evidence regarding the product development timeline to launch an MCED test, and show that many years of development are required before launching an MCED test like Galleri. (PFF ¶¶ 707.1–707.3.)

Response to Finding No. 707

[redacted]



[redacted]

707.1 For each cancer included in an MCED test, you "have to go through a somewhat similar process to what GRAIL did", meaning '"a research phase", '"a test

development phase", and '"a clinical phase", and that must be done "for each cancer", which, if done "serially" would take a "very long time" and is "not practical". (Aravanis (Illumina) Tr. 1895–96.)

Response to Finding No. 707.1

The proposed finding is vague, misleading, unsupported, and against the weight of the evidence. Respondents have merely cited self-serving testimony from their own executive, Illumina's Alex Aravanis, to make a sweeping statement about the development efforts of *all* MCED tests. There is no evidence Dr. Aravanis has the foundation to speak about the development of any MCED test besides potentially Grail's Galleri, let alone every MCED test. The testimony cited involves only a question for Dr. Aravanis about the process for developing Grail's Galleri MCED test and no other test. (Aravanis (Illumina) Tr. 1895–96). Further, Respondents have quoted Dr. Aravanis's testimony as an alleged "fact," despite his lack of foundation and ability to speak to the development of MCED tests. This finding should be wholly disregarded as impermissibly unsupported. Furthermore, the proposed finding is vague and misleading because Respondents have not defined "somewhat similar process," any of the "phases" they reference (i.e. "research phase," "test development," and "clinical"), or "serially." Respondents have also not attempted to quantify how long a process would take beyond a "very long time," which is itself vague and misleading. These appear to be quotes from Dr. Arvanis's cited testimony, which make them mere unsupported testimony about a topic for which he lacks foundation. This is far from a supported "fact" that has any probative value.

Further, the proposed finding is incorrect to the extent Respondents are implying Grail's Galleri can screen for 50 early-stage cancers and is unique compared to other MCED tests.

[redacted]

[redacted]

[redacted]

[redacted]

707.2 As Dr. Chahine of Helio Health confirmed, compared to the R&D process for a single-cancer screening test, "[i]t probably gets exponentially harder if you're adding . . . five and ten cancers, and so just from a practical standpoint, a small company trying to go after multiple cancers at the same time I think is just really just not feasible." (Chahine (Helio) Tr. 1032.)

Response to Finding No. 707.2

The proposed finding is vague, misleading, unsupported, and against the weight of the evidence. The proposed finding is vague and misleading because Respondents have merely stated "[a]s Dr. Chahine of Helio Health confirmed" without explaining what he confirmed. Further, to the extent Respondents are intending to tie this proposed finding to their Proposed Finding ¶ 707.1, this proposed finding is vague and misleading because Dr. Chahine clearly prefaced his comments by saying "it *probably* gets exponentially harder" and "a *small* company trying to go after multiple cancers at the same time." (Chahine (Helio) Tr. 1032). As explained in the response to Respondent's Proposed Finding ¶ 707.1, this proposed finding does not provide sufficient support for the sweeping conclusion Respondents intend to make about *all* MCED test developers. (*See* Response to RPFF ¶ 707.1).

Further, the proposed finding is incorrect to the extent Respondents are implying Grail's Galleri can screen for 50 early-stage cancers and is unique compared to other MCED tests.

[redacted]

[redacted]

[redacted]

[redacted]

707.3 Accounting for all of these steps in the development process, Dr. Cote opined that most of the putative MCED developers identified by Complaint Counsel were at least five to seven years away from launching any kind of MCED test. ([redacted] 3727, [redacted]

Response to Finding No. 707.3

[redacted]

- [redacted]

[redacted]

- [redacted]

- [redacted]

- [redacted]

- [redacted]

[redacted]

708. No proof of interchangeability. Even if the tests in development were on the market, or could be expected to launch in the near term, Complaint Counsel failed to prove that any of these tests will be reasonably interchangeable with Galleri if and when they are launched. (PFF ¶¶ 708.1–708.3.)

Response to Finding No. 708

The proposed finding should be disregarded because it is not a "finding of fact," but rather a legal conclusion in contravention of this Court's order and the Part 3 rules. (*See* 16 C.F.R. § 3.46; Order on Post-Trial Findings). [redacted]

The proposed finding should also be disregarded because it is vague, misleading, unsupported, against the weight of the evidence, and unreliable. The proposed finding is unsupported because Respondents have provided only cross-references to their own findings in support of this legal conclusion, none of which are reliable evidence to support the finding. (*See* Response to RPFF ¶¶ 708.1, 708.2, 708.3). The proposed finding is also vague and misleading

because they have used legal terminology like "reasonably interchangeable" without defining it or offering any explanation of what it means. [redacted]

- [redacted]
- [redacted]

[redacted]

- [redacted]
- [redacted]
- [redacted]

[redacted]

708.1 The purchasers of any MCED test will be patients, health care providers and/or insurers. (*See* RX3871 (Willig Expert Report) ¶ 12.)

Response to Finding No. 708.1

The proposed finding should be disregarded because it is impermissibly unsupported and unreliable. Respondents have only cited to their own expert report from Dr. Robert Willing in direct contravention of the Court's order barring the use of expert testimony "to support factual propositions that should be established by fact witnesses or documents," (*see* Order on Post-Trial Briefing at 3), and thus this finding should be wholly disregarded as unsupported and unreliable.

708.2 Complaint Counsel did not call any medical expert, nor a single patient, health care provider or insurer to testify that he/she would substitute one of the tests in development (were it ever to be sold) for Galleri. (RX6004 (Katz Trial Dep. at 18.)

Response to Finding No. 708.2

[redacted]

[redacted]

708.3 Nor did Complaint Counsel conduct any surveys of such groups. (RX6004 (Katz Dep. at 19–20) (Complaint Counsel's expert "didn't attempt to fill those

information gaps in by, say, doing some sort of survey of, you know, clinicians or payers to understand what they would think about, you know, various alternatives and how close they would view those to be substitutes and then try to infer from that what that would mean for their switching behavior.").)

Response to Finding No. 708.3

[redacted]

709. Ample proof of no interchangeability. Numerous witnesses testified that Galleri is not reasonably interchangeable with the MCED tests in development. (PFF ¶¶ 709.1–709.6.)

Response to Finding No. 709

The proposed finding is unsupported by any reliable evidence and is against the

overwhelming weight of the evidence. [redacted] Instead, the overwhelming weight of the evidence shows that Galleri is reasonably interchangeable with MCED tests in development. [redacted]

Therefore, this Court should disregard the proposed finding.

> 709.1 Francis deSouza, Illumina's CEO, testified, based on his conversations with doctors during due diligence for the Transaction, that Galleri would not compete with tests that screen for fewer than ten cancers or with tests that do not identify cancer signal of origin. (deSouza (Illumina) Tr. 2336–37 ("[D]octors who are looking for 50 cancers and doing a screen would not want a test that did not tell the patient where that cancer was. They felt that that [it] would [not work] to raise so much anxiety in a person without telling them what they actually have. And so for that use case, for doing screening of a healthy person to identify if they have 50 cancers, they felt it was essential that as part of the conversation with the patient you're immediately able to say what to do next, you know, look at this organ, image your pancreas or something . . . and so they would not substitute Galleri with another test that identified 50 cancers but didn't tell you what cancer it was and where it was, and so they are not substitutes."))

Response to Finding No. 709.1

The proposed finding should be wholly disregarded as unreliable hearsay. Respondents have offered the self-serving testimony of Illumina's CEO, Francis deSouza, who has merely repeated what he allegedly heard from unnamed "doctors." Even if you were to accept the premise that Mr. deSouza in fact heard from a single doctor, let alone enough sufficient to make

this sweeping statement about *all* doctors' preferences, Respondents have now tried to offer what he allegedly heard for the truth of the matter asserted—a violation of the rule against hearsay. Neither Respondents nor Mr. deSouza have provided any information about the doctors he allegedly spoke with or their qualifications for making the comments they made. Even more, Respondents have offered this hearsay as the sole support to establish a seemingly legal conclusion about competition in the MCED market. This proposed finding should be disregarded as unsupported and unreliable.

Respondents also offer this hearsay while ignoring the ample evidence on the record about competition in the MCED market. [redacted]

Further, the proposed finding is incorrect as it relies upon testimony from Mr. deSouza that presupposes Grail's Galleri can screen for 50 early-stage cancers. [redacted]

[redacted]

[redacted]

709.2 Illumina's Chief Technology Officer (and GRAIL's former Chief Science Officer and Head of R&D), Dr. Alex Aravanis, testified that it is "unlikely" Galleri will

> compete with a test that screens for fewer than ten cancers and that Galleri would not compete with a test that does not identify cancer signal of origin, since it would be used in a very different clinical context than Galleri. (Aravanis (Illumina) Tr. 1921–22.)

Response to Finding No. 709.2

The proposed finding should be disregarded as unsupported, unreliable, vague, misleading, and against the weight of the evidence. Respondents have merely cited self-serving testimony from their own executive, Illumina's Alex Aravanis, to make a sweeping statement about competition between MCED tests. There is no evidence Dr. Aravanis has the foundation to speak about competition between MCED tests as an Illumina executive, regardless of his prior experience at Grail. Respondents also made no attempt to lay a foundation for how or why Dr. Aravanis would know whether Grail's Galleri will "compete with a test that screens for fewer than ten cancers and that Galleri would not compete with a test that does not identify cancer signal of origin." Further, with respect to his testimony about the cancer signal of origin, Dr. Aravanis's testimony merely said he did not "believe so" when asked about competition with the Galleri. The proposed finding is also vague, misleading, and unsupported because Respondents have not defined or identified the term "clinical context" as used in the finding. To the extent they are referring to the setting that a physician would give an MCED test, Dr. Aravanis clearly lacks the foundation to speak about the practicing behavior of all physicians.

Respondents also offer this unreliable testimony while ignoring the ample evidence on the record about competition in the MCED market. [redacted]

Further, the proposed finding is incorrect as it relies upon testimony from Dr. Aravanis that presupposes Grail's Galleri can detect 50 cancers. [redacted]

[redacted]

[redacted]

709.3 GRAIL's then-CEO, Hans Bishop, testified that he did not foresee Galleri competing with other MCED developers, such as Guardant, Freenome, Exact/Thrive and Singlera, given the substantial differences between the tests those companies may be developing and Galleri. (Bishop (GRAIL) Tr. 1390–91; 1393–94 (Freenome); 1397 (Exact/Thrive); 1399 (Singlera).)

Response to Finding No. 709.3

The proposed finding should be disregarded as misleading, unsupported, unreliable, and against the weight of the evidence. Respondents have cited the self-serving testimony of Grail's former CEO, Hans Bishop, whose testimony does not even support Respondents' proposed finding. With respect to Guardant and Freenome, Mr. Bishop was testifying about competition between the companies' *single-cancer* screening tests and Grail's Galleri MCED test. (*See* Bishop (Grail) Tr. 1390-91 (testifying that he was only referring to Guardant's "single cancer focused test" and "the reason that we should not use Galleri instead of any of those single tests is because those single tests are optimized for detecting those single cancers"); 1393-94 (testifying that he does not think Freenome's single-cancer colorectal test will compete with Grail's Galleri "[f]or the same reasons we've covered, that [single-cancer tests] should be used in combination"). Complaint Counsel does not disagree that Grail's Galleri does not compete with single-cancer screening tests. [redacted]

With respect to Thrive/Exact and Singlera, Mr. Bishop testified that he *did not know* if their MCED tests would compete with Grail's Galleri. (Bishop (Grail) Tr. 1397 (in response to a question about whether he expected "Exact's test in development to compete with Galleri if it ever becomes available for purchase," testifying that "[t]hat's really not possible to understand at this point in time because we don't know what the performance features of such a test may be"); 1399 (replying to a question about competition with Singlera's PanSeer MCED test that "[a]gain, I – I don't know . . . I don't think it's possible to know"). This proposed finding should thus be completely disregarded as misleading, unsupported, and unreliable.

Even if supported, this proposed finding is entirely against the evidence including even contradictory testimony from Mr. Bishop. Mr. Bishop also testified that patients benefit from having multiple MCED tests in development, explaining: "difficult problems are, by definition, hard to solve, and having a multitude of different approaches is a good thing." (PX7069 (Bishop (Grail) IHT at 154-56)). He went on to emphasize that "one of the exciting things about the horizon scanning we do and the field in general is the number of different approaches different companies are taking." (PX7069 (Bishop (Grail) IHT at 154-56). Whereas Grail has chosen to focus on cfDNA methylation, he explained that other companies have chosen to focus on protein analysis and others on multi-omics that "combin[e] those different modalities." (PX7069 (Bishop (Grail) IHT at 154-56)). These approaches, Bishop emphasized, all intend to reach the same goal—"to get to the highest-performing technology." (PX7069 (Bishop (Grail) IHT at 154-56)). [redacted]

[redacted] The proposed finding should thus be wholly disregarded as unsupported, unreliable, and against the weight of the evidence.

709.4 Dr. Josh Ofman, GRAIL's Chief Medical Officer, testified that Galleri will not compete with MCED tests that are first pursuing colon cancer tests: "[w]e screen for colon cancer with stool-based colon cancer screening tests or colonoscopy, which is the gold standard, and so . . . for people who want to use blood to look for colon cancer, they'll just do that. But adding a multicancer early detection test to the single-cancer screening test is a very different activity. They're not really competing." (Ofman (GRAIL) Tr. 3310–11.) Dr. Ofman also testified that Galleri would not compete with a test that detected two or three cancers, because "conceptually what you're trying to do with Galleri is very different than something you'd be trying to do with a test that says we can find stomach and esophageal cancer." (Ofman (GRAIL) Tr. 3312–13.)

Response to Finding No. 709.4

[redacted]

[redacted]

709.5 Dr. Cote testified that [redacted]

Response to Finding No. 709.5

[redacted]

[redacted]

[redacted]

[redacted]

709.6 [redacted]

Response to Finding No. 709.6

[redacted]

[redacted]

[redacted]

710. The intuition as to complementarity between a 50 cancer test and a test that screens for fewer cancers was also supported by some of Complaint Counsel's third party witnesses. (PFF ¶¶ 710.1–710.3.)

Response to Finding No. 710

The proposed finding is incorrect to the extent Respondents are implying Grail's Galleri can provide early detection of 50 cancers. [redacted]

[redacted]

[redacted]

Furthermore, the proposed finding is vague, misleading, and unsupported because Respondents have not explained or defined the phrase "intuition as to complementarity." This proposed finding, and use of the word "complementarity, appears to be a legal argument proposed as a "fact" in contravention of this Court's order and the Part 3 rules. (*See* 16 C.F.R. §

3.46; Order on Post-Trial Findings). Therefore, this Court should disregard the proposed finding.

710.1 [redacted]

Response to Finding No. 710.1

[redacted]

[redacted]

710.2 [redacted]

Response to Finding No. 710.2

[redacted]

[redacted]

710.3 In response to questioning about what customers will view PanSeer and Galleri as substitutable options, Singlera's Chairman Gary Gao testified that "I don't think there is a product yet. And I could not say how we are interchangeable right now . . .." (PX7042 (Gao (Singlera) IHT at 101).)

Response to Finding No. 710.3

The proposed finding is misleading, incorrect, unreliable, and against the weight of the evidence to the extent Respondents are implying that Singlera's PanSeer MCED test does not compete with Grail's Galleri. [redacted]

Further, the proposed finding is misleading and against the weight of the evidence to the extent Respondents imply Singlera is not actively pursuing the commercialization of its PanSeer

MCED test. Singlera has already completed a proof-of-concept study of its PanSeer test in China on 100,000 people, known as the Taizhou Longitudinal Study, identifying lung, esophageal, liver, colorectal, and gastric cancers at least four years before conventional diagnosis. (PX7042 (Gao (Singlera) IHT at 28-30); *see also* Gao (Singlera) Tr. 2878-79). Singlera's PanSeer MCED test is designed to detect all kinds of cancer, and not just the five cancers used in the Taizhou Longitudinal Study, with the goal of offering a "pan-cancer" test. (Gao (Singlera) Tr. 2881). Singlera has already invested between $60-100 million on the development of the PanSeer MCED test and expects to launch it as an FDA approved test by 2028. (Gao (Singlera) Tr. 2888-89; PX7042 (Gao (Singlera) IHT at 96)). Therefore, this Court should disregard the proposed finding.

711. Complaint Counsel has no testimony from potential consumers of MCED tests. (*See* RX6004 (Katz Trial Dep. at 18.)

Response to Finding No. 711

This proposed finding is misleading to the extent it implies that Complaint Counsel has failed to show a substantial lessening of competition. [redacted] Therefore, this Court should disregard the proposed finding.

712. The only testimony that Complaint Counsel elicited regarding this point is self-serving testimony from certain MCED test developers that they view GRAIL as a rival and expect the tests they are working on to compete with Galleri (if ever they were launched). (*E.g.*, [redacted]; PX7100 (Chudova (Guardant) Dep. at 22–23); PX7042 (Gao (Singlera) IHT at 96, 98–100); [redacted]

[redacted]
PX7068 (Perettie, IHT at 76).)

Response to Finding No. 712

[redacted]

3. ***Brown Shoe* Factors**

a. No industry or public recognition of the alleged market as a separate economic entity

713. Neither the industry nor the public recognizes an MCED market as defined by Complaint Counsel. (PFF ¶¶ 717–721.)

Response to Finding No. 713

The proposed finding should be disregarded because it is not a "finding of fact," but rather a legal conclusion in contravention of this Court's order and the Part 3 rules. (*See* 16 C.F.R. § 3.46; Order on Post-Trial Findings). Respondents have merely represented their

argument as a "fact." The proposed finding is also vague and ambiguous because it refers to an industry view without identifying any industry. The proposed finding is also unsupported because no evidence is cited for the factual proposition.

714. There is an NGS-based multi-cancer early detection test available for sale in the U.S. (Galleri) and a number of companies are working to develop cancer screening tests, some of which have been loosely described as MCED tests. (PFF ¶¶ 698, 701–706.)

Response to Finding No. 714

The proposed finding should be disregarded because it is not a "finding of fact," but rather a legal conclusion in contravention of this Court's order and the Part 3 rules. (*See* 16 C.F.R. § 3.46; Order on Post-Trial Findings). Respondents have merely represented their argument as a "fact." The proposed finding is also vague and ambiguous because it refers to how "some" tests are described without identifying which tests it refers to. The proposed finding is also unsupported because no evidence is cited for the factual proposition.

715. But there is no industry or public recognition of a separate "economic entity" comprised of any NGS-based screening test that detects more than one cancer type. (PFF ¶¶ 717–721.)

Response to Finding No. 715

The proposed finding should be disregarded because it is not a "finding of fact," but rather a legal conclusion in contravention of this Court's order and the Part 3 rules. (*See* 16 C.F.R. § 3.46; Order on Post-Trial Findings). Respondents have merely represented their argument as a "fact." The proposed finding is also vague and ambiguous because it refers to an industry view without identifying any industry. The proposed finding is also unsupported because no evidence is cited for the factual proposition.

715.1 Galleri is the only test on the market, and it has been shown (with published data) to detect more than 50 cancers and tissue of origin. (Bishop (GRAIL) Tr. 1373–74; RX0744 (GRAIL) slide 22, 100.)

Response to Finding No. 715.1

The proposed finding should be disregarded because it is incorrect, unreliable, and against the weight of the evidence. [redacted]

[redacted]

[redacted]

715.2 None of the MCED tests in development has had a single sale. (*See* Bishop (GRAIL) Tr. 1401.)

Response to Finding No. 715.2

The proposed finding is misleading and against the weight of the evidence to the extent Respondents are implying that Grail is significantly ahead of other MCED developers in the commercialization of an MCED test. [redacted]

[redacted]

- [redacted]
- [redacted]
- [redacted]
- [redacted]

[redacted]

715.3 None has been shown to detect more than 10 cancers (and most far fewer) and none has the ability to detect cancer signal of origin. (PFF ¶¶ 684.1–684.2.)

Response to Finding No. 715.3

The proposed finding is vague, misleading, and against the weight of the evidence. The proposed finding is vague and misleading because Respondents have not identified or defined their reference to "none" in their proposed finding. To the extent Respondents are referring to MCED tests other than Grail's Galleri, the proposed finding is misleading, against the weight of the evidence, and incorrect to the extent they are drawing a comparison to Grail's Galleri and its ability. [redacted]

The proposed finding is incorrect to the extent Respondents are implying Grail's Galleri can provide early detection of 50 cancers. [redacted]

[redacted]

[redacted]

715.4 Indeed, most of the in-development tests are focused at present solely on detecting a single cancer with the aspiration of one day detecting more cancers by adding additional bio markers and conducting additional clinical trials. (*See* Chudova (Guardant) Tr. 1154, 1179; [redacted]

Response to Finding No. 715.4

[redacted]

[redacted]

716. The available industry or public information about the putative MCED tests in development does not suggest that these tests belong in the same product market as Galleri. Instead, they make clear that they are all very different from Galleri. (PFF ¶¶ 717–721.)

Response to Finding No. 716

The proposed finding should be disregarded because it is not a "finding of fact," but rather a legal conclusion in contravention of this Court's order and the Part 3 rules. (*See* 16

C.F.R. § 3.46; Order on Post-Trial Findings). Respondents have merely represented their argument as a "fact." The proposed finding is also vague and ambiguous because it refers to an industry view without identifying any industry. The proposed finding is also unsupported because no evidence is cited for the factual proposition.

717. Analyst reports from investment banks that cover the broader biotechnology space recognize that Galleri is very different. (PFF ¶¶ 717.1–717.2.)

Response to Finding No. 717

The proposed finding should be disregarded as incorrect and unreliable. Respondents only cite to their own proposed findings to support an overarching claim that "investment banks that cover the broader biotechnology space recognize that [the] Galleri is very different," each underlying finding, as explained below, is entirely reliant an unreliable, vague evidence and hearsay. (*See* Response to RPFF ¶¶ 717.1, 717.1.1, 717.1.2, 717.1.3, 717.2, 717.2.1). The proposed finding is thus unreliable. Further, the proposed finding is misleading and unreliable because Respondents have not defined or explained "investment banks," the "broader biotechnology space," or what it means that Grail's Galleri is "very different." Respondents have also not explained the foundation for "investment banks that cover the broader biotechnology space" to compare Grail's Galleri to other tests, let alone to distinguish the Galleri from other MCED tests. The proposed finding is further misleading because Respondents haven't compared Grail's Galleri to other MCED tests—instead, Respondents have merely stated that these banks recognize that "Galleri is very different" without actually explaining finishing the comparison to another test. The proposed finding is thus incomplete and unreliable because Respondents haven't even finished their own comparison.

The proposed finding is also against the weight of the evidence to the extent Respondents are implying that Grail's Galleri does not compete with other MCED tests. [redacted]

[redacted]

717.1 For instance, a report on the liquid biopsy market from Cowen notes that GRAIL has "conducted systematic clinical studies" and that Galleri "has been shown to be capable of identifying >50 types of cancers by scanning methylation patterns". (PX2022 (Cowen) at 27).)

Response to Finding No. 717.1

The proposed finding should be disregarded as unreliable and incorrect to the extent Respondents are implying that Grail's Galleri has been clinically shown to be capable of providing early detection of 50 cancers in asymptomatic patients. The proposed finding is unreliable because Respondents are relying on statements made in a third-party document from a party that was neither called as a witness nor otherwise provided evidence to indicate the reliability of the claim. As an out-of-court statement offered for the truth of the matter asserted, the proposed finding is hearsay to the extent Respondents are implying that Grail's Galleri can detect 50 cancers early in a screening setting.

[redacted]

[redacted]

[redacted]

[redacted]

- [redacted]
- [redacted]
- [redacted]

[redacted]

- [redacted]
- [redacted]

[redacted]}

717.1.1 The only other entity it recognizes as pursuing a multicancer screening test is Thrive, but notes that it had only been shown to detect 10 cancers and required the use of a confirmatory PET-CT scan. (PX2022 (Cowen) at 27, 29.)

Response to Finding No. 717.1.1

The proposed finding should be discarded because it is impermissibly vague, misleading, unreliable, and against the weight of the evidence. The proposed finding is vague and misleading because Respondents have not attributed the alleged fact to anyone, instead merely

say "[t]he only other entity *it* recognizes" without specifying who or what they are referencing. The proposed finding is also unreliable to the extent they are referring to the report from Cowen Research referenced in their citation and implying that Thrive can only "detect 10 cancers" and requires "the use of a confirmatory PET-CT scan." Respondents are relying on statements made in a third-party document from a party that was neither called as a witness nor otherwise provided evidence to indicate the reliability of the claims. As an out-of-court statement offered for the truth of the matter asserted, the proposed finding is hearsay to the extent Respondents offer the Cowen Report to suggest anything about the functionality of Thrive's CancerSEEK test.

The proposed finding is also against the weight of the evidence to the extent Respondents are implying that Thrive/Exact's CancerSEEK can detect fewer cancers than Grail's Galleri.

[redacted]

717.1.2 The report notes that Freenome and Guardant are among the companies in a separate market segment pursuing single-cancer screening tests to detect colorectal cancer (PX2022 (Cowen) at 30–31), lists Singlera in passing under the heading "[s]ome [o]thers" following its summary of the colorectal cancer screening market (PX2022 (Cowen) at 33), and considers Helio in a separate segment for "High Risk Cancer Detection" for its liver cancer screening test. (PX2022 (Cowen) at 29, 35, 37, 38.)

Response to Finding No. 717.1.2

The proposed finding should be discarded because it is impermissibly vague, misleading, unreliable, and against the weight of the evidence. The proposed finding is vague and misleading because Respondents have stated "[t]he report" without providing any additional

context for what report they're referencing. The proposed finding is also unreliable to the extent they are referring to the report from Cowen Research used in their citation. The proposed finding is unreliable because Respondents are relying on statements made in a third-party document from a party that was neither called as a witness nor otherwise provided evidence to indicate the reliability of their claim. As an out-of-court statement offered for the truth of the matter asserted, the proposed finding is hearsay to the extent Respondents are implying that Freenome and Guardant are "in a separate market segment pursuing single-cancer screening tests to detect colorectal cancer" and Helio is in a separate market segment for "liver cancer screening tests" only. [redacted]

[redacted]

717.1.3 Cowen does not recognize [redacted] as pursuing early cancer detection at all: it notes [redacted] as a participant in the recurrence monitoring/MRD and "liquid biopsy for biopharma" (*i.e.* companion diagnostic) segments (PX2022 (Cowen) at 46–53), and [redacted] in the therapy selection and "liquid biopsy for biopharma" market segments (PX2022 (Cowen) at 39, 54).

Response to Finding No. 717.1.3

[redacted]

[redacted]

[redacted]

717.2 An analyst note from SVBLeerink comes to a similar conclusion, only mentioning GRAIL and Thrive as pursuing "multi-cancer detection" and noting that Guardant and Freenome are among those in the colorectal cancer screening space. (PX4180 (SVBLeerink) at 32.)

Response to Finding No. 717.2

[redacted]

[redacted]

[redacted]

717.2.1 SVBLeerink also notes a number of "must have" features for an multi-cancer screening assay, including cancer signal of origin capability (which it notes as "essential"); "99%+ specificity"; detection of "higher mortality cancers with no current screening methodologies"; "and [l]arge-scale, prospective trials that reflect prevalence of cancer in the real world". (PX4180 (SVBLeerink) at 32.) Only Galleri can claim to have these features. (PFF ¶¶ 61–62, 355, 400–01.)

Response to Finding No. 717.2.1

The proposed finding is vague, misleading, unsupported, unreliable, incorrect, and against the weight of the evidence. The proposed finding is vague and misleading to the extent Respondents are alleging the "must have" features they list are in fact required features of an MCED test. Respondents have not provided any explanation for the reliability or credibility of SVBLeerink, including its ability to identify required features of an MCED test. Respondents have also not identified what it means to be a "must have" feature or its relationship to competition in the market for MCED tests. The proposed finding is also unreliable because Respondents are relying on statements made in a third-party document from a party that was neither called as a witness nor otherwise provided evidence to indicate the reliability of their claim. As an out-of-court statement offered for the truth of the matter asserted, the proposed finding is hearsay to the extent Respondents are implying that the features they list are "must have" features for an MCED test.

[redacted]

[redacted]

[redacted]

[redacted]

[redacted]

[redacted]

[redacted]

The proposed finding is also incorrect to the extent Respondents are implying that Grail has conducted multiple prospective clinical trials on its Galleri test "that reflect prevalence of cancer in the real world." Grail had released results from two clinical studies as of trial: the Circulating Cell-free Genome Atlas ("CCGA") study and the PATHFINDER study. (Aravanis (Illumina) Tr. 1891-92; Cote, Tr. 3993). [redacted] Grail's PATHFINDER study was an interventional study that involved 6,600 patients. (Ofman (Grail) Tr. 3293). Grail has only produced interim results from its PATHFINDER study, which do not show the Galleri can detect 50 cancers in an asymptomatic screening population. (Cote Tr. 4000-02; Ofman (Grail) Tr. 3293, 3298). According to Dr. Ofman, to find 50 cancer types "in a real-world population is going to require hundreds of thousands of people [and] PATHFINDER was not designed to do that." (Ofman (Grail) Tr. 3298). [redacted] The proposed finding is incorrect to the extent Respondents are implying that these trial results are considered "[l]arge-scale, prospective trials that reflect prevalence of cancer in the real world."

The proposed finding is also incorrect and misleading to the extent Respondents are implying that Grail's Galleri has "99%+ specificity" in its intended use for an asymptomatic cancer screening population for an FDA approved test. [redacted]

[redacted] Without an FDA-approved clinical trial, the proposed finding is misleading and incorrect to the extent Respondents are claiming Grail's Galleri has a "99%+ specificity." Therefore, this Court should disregard the proposed finding.

718. [redacted]

Response to Finding No. 718

[redacted]

[redacted]

718.1 [redacted]

[redacted]

[redacted]

Response to Finding No. 718.1

[redacted]

[redacted]

[redacted]

719. The features and functions of Galleri are described in detail in several peer-reviewed publications, including Annals of Oncology, (RX3409 (Klein et al 2021); RX3430 (Liu et al 2020)), and GRAIL has multiple clinical trials listed at clinicialtrials.gov. (*See* RX3133 (Clinicaltrials.gov); RX3134 (Clinicaltrials.gov); RX3135 (Clinicaltrials.gov).)

Response to Finding No. 719

Complaint Counsel has no specific response to the proposed finding. To the extent Respondents intend to offer the content of any of the cited materials for the truth of the matter asserted in the article, Complaint Counsel objects to the evidence as hearsay that should be wholly disregarded. These articles are out-of-court statements that Respondents do not submit with sufficient indicia of reliability for admission as evidence.

719.1 The available peer-reviewed publications show, with only two exceptions, that Complaint Counsel's so-called "MCED" developers have only published peer reviewed articles or initiated clinical trials, if any, for single-cancer screening tests. (RX3132 (Clinicaltrials.gov); RX3426 (Lin et al., 2021), RX3592 (Putcha et al., 2020); RX3740 (Westesson et al., 2020); RX3128 (Clinicaltrials.gov), RX3405 (Kim et al., 2019) (Guardant); RX3616 (Roy et al., 2019); RX3617 (Roy et al., 2019) (Helio).)

Response to Finding No. 719.1

The proposed finding is vague, misleading, confusing, incomplete, unsupported, incorrect, and against the weight of the evidence. The proposed finding is vague, misleading, confusing, and incomplete because Respondents have claimed that "with only two exceptions" but not identified what those exceptions entail. Further, the proposed finding is unsupported and incomplete because Respondents have merely cited a collection of third-party documents that Respondents appear to suggest provides an exhaustive list of resources to show peer-reviewed publications. Respondents had the opportunity to collect evidence, including documents and testimony, from each of the MCED developers yet still only supported the finding with citations

to third-party materials. These citations do not and cannot support an assertion about the universe of all "available peer reviewed publications" as Respondents allege. As an unsupported "fact," the proposed finding is thus unreliable and should be disregarded.

[redacted]

- [redacted]
- [redacted]

[redacted]

- [redacted]
- [redacted]
- [redacted]

[redacted]

720. Some have not even published articles or initiated clinical trials relating to cancer screening at all. (RX3869 (Cote Expert Report) at 301 (FMI/Roche); RX3869 (Cote Expert Report) ¶ 228, at 303 (Natera).)

Response to Finding No. 720

The proposed finding should be disregarded because it is vague, misleading, and incorrect. The proposed finding is vague and misleading because Respondents have not defined or explained "some" or "published articles." The definition of these words is material for understanding the proposed finding, and without defining either the proposed finding is unsupported and thus unreliable. [redacted]

721. Other than Galleri, only Exact/Thrive and Singlera have conducted clinical trials and/or published one or more peer reviewed articles about MCED tests in development. (RX3419 (Lennon et al., 2020); RX3115 (Chen et al., 2020).) But that data shows that these tests are very different from Galleri. (PFF ¶¶ 721.1–721.4.)

Response to Finding No. 721

[redacted]

[redacted]

[redacted]

721.1 The Exact/Thrive data shows only that its CancerSEEK assay can detect, at most, 10 types of cancer—with no identification of tissue of origin (a whole body PET-CT scan is required to identify the tissue of origin for every positive case). (RX3419 (Lennon et al 2020); Cote Tr. 3811–14.)

Response to Finding No. 721.1

[redacted]

[redacted]

[redacted]

721.2 [redacted]

Response to Finding No. 721.2

[redacted]

[redacted]

[redacted]

721.3 Similarly, the published Singlera data is from a 418–sample case control study and shows only that Singlera's PanSeer assay could detect five types of cancer. (RX3115 (Chen et al 2020) at 3.)

Response to Finding No. 721.3

The proposed finding is misleading to the extent it implies that Singlera's PanSeer assay can only detect five types of cancer. Rather the weight of the evidence shows that the PanSeer test is designed to work for any type of cancer. (PX7102 (Gao (Singlera) Dep. at 94-95)). As Dr. Gao testified that Singlera's "goal is pan-cancer" for the PanSeer test. (Gao (Singlera) Tr. 2881). Therefore, this Court should disregard the proposed finding.

721.4 Moreover, the data show that PanSeer achieved only 96.1% specificity, (RX3115 (Chen et al 2020) at 1), [redacted]

Response to Finding No. 721.4

[redacted]

[redacted]

[redacted]

[redacted]

b. The products' peculiar characteristics and uses

722. Unique characteristics. Galleri sequences a patient's blood sample to detect methylation and then takes the data and analyzes it using a machine learning algorithm, which will classify the methylation pattern as a cancer signal or noncancer signal. (Ofman (GRAIL) Tr. 3285–88; Aravanis (Illumina) Tr. 1886–87; RX3025 (Alexander et al 2021) at 4.)

Response to Finding No. 722

The proposed finding is vague and misleading to the extent Respondents are implying that Grail's Galleri is the only MCED test to use blood samples or a machine learning algorithm. The evidence makes clear that other MCED tests use blood draws and machine learning algorithms. (*See* CCFF ¶¶ 1904-2594).

723. If a cancer signal is detected, the sample is analyzed again using the machine learning algorithm to predict the cancer's signal of origin. (Ofman (GRAIL) Tr. 3285–88; Aravanis (Illumina) Tr. 1886–87; RX3025 (Alexander et al 2021) at 4.)

Response to Finding No. 723

The proposed finding is misleading and against the weight of the evidence to the extent Respondents are implying that Grail's Galleri test will not require additional scanning to determine the tissue of origin after a positive result. The weight of the evidence shows that Grail's MCED will require additional screening to identify the tissue of origin, including as its former CEO, Hans Bishop, testified a body scan for certain patients. (CCFF ¶ 3565; *see also*

CCFF ¶¶ 3566-69). Therefore, this Court should disregard the proposed finding.

724. Galleri has been shown to detect more than 50 cancers with high specificity, and cancer signal of origin with high accuracy. (Bishop (GRAIL) Tr. 1373–74; RX0744 (GRAIL) slide 22, 100.) No other test has been shown to detect more than 10 cancers or been able to detect the cancer signal of origin. (*See* PFF ¶¶ 684.1–684.2.)

Response to Finding No. 724

The proposed finding is incorrect and against the weight of the evidence. To the extent Respondents are implying that Grail's Galleri can identify the tissue of origin without additional screening, the proposed finding is against the weight of the evidence. The weight of the evidence shows that Grail's MCED will require additional screening to identify the tissue of origin, including as its former CEO, Hans Bishop, testified a body scan for certain patients. (CCFF ¶ 3565; *see also* CCFF ¶¶ 3566-69).

[redacted]

[redacted]

[redacted]

[redacted]

725. Most of the tests in development are too underdeveloped to permit a meaningful comparison of their features, and at present are being actively developed as single cancer tests (not MCED tests), but the three for which there are data are readily distinguishable, as illustrated in the below table:

Table 7

Test	Galleri	CancerSEEK			PanSeer
		1 Blood Test	2 Blood Tests	2 Blood + PET-CT	
Study	CCGA3	DETECT-A			Taizhou L.S.
Types of Cancer	50	10			5
Cancer Signal of Origin	Yes	No	No	Yes	No
Specificity	99.5%	95.3%	98.9%	99.6%	96.1%
Sensitivity	51.5%	30.2%	27.1%	15.6%	94.9%
PPV	44.4%	5.9%	19.4%	28.3%	

(RX3409 (Klein et al., 2021) at 5; RX3419 (Lennon et al., 2020) at 7; RX3115 (Chen et al., 2020) at 4.)

Response to Finding No. 725

The proposed finding is unsupported, misleading, improper, against the weight of the evidence. The statement "[m]ost of the tests in development are too underdeveloped to permit a meaningful comparison of their features" is an argument, not a fact, and is unsupported by the sources cited supports that statement. This Court should disregard that statement as unsupported.

The proposed finding is misleading because the overwhelming weight of the evidence shows that the CCGA study is not indicative of Galleri's performance in the intended use (asymptomatic) population as explained below. Any attempt to compare directly the results in DETECT-A (an interventional study involving asymptomatic individuals) and Taizhou (an observational study involving asymptomatic individuals) with CCGA (a case-control study involving diagnosed cancer patients, including patients with Stage IV cancer) meaningless and inherently unreliable. They are fundamentally different types of studies. Dr. Ofman of Grail conceded that "[t]o find all 50 cancer types in a real-world population would require hundreds of thousands of people[.]" (RPFF ¶ 398.4 (quoting Ofman (Grail) Tr. 3298).

[redacted]

The authors of the CCGA-3 sub-study itself make this point explicitly in their article, cautioning that "CCGA is a case-control study, and as such, is not reflective of performance in a screening population." (RX3409 at 010 (E.A. Klein, et al., Clinical Validation of a Targeted Methylation-Based Multi-Cancer Early Detection Test Using an Independent Validation Set, 9 Annals of Oncology 1167 (2021)). The authors of the CCGA-2 sub-study provide the same caveat about CCGA, stating: "to understand [Galleri's] performance in an asymptomatic screening population will require additional studies" beyond CCGA. (RX3430 at 10 (M.C. Liu, et al., Sensitive and Specific Multi-Cancer Detection and Localization Using Methylation Signatures in Cell-Free DNA, 6 Annals of Oncology 745 (2020)). Accordingly, Grail cannot say today what the sensitivity of its MCED test will be in Galleri's intended use population (i.e. in an asymptomatic screening population).

To put the above points plainly, a case control study will tend to produce inflated performance results relative to how a test would performance in an asymptomatic screening population (the actual population in which MCED tests are intended to be used). Notwithstanding this, and notwithstanding the above admissions, Respondents nonetheless attempt to compare their case-control results to results from studies involving asymptomatic populations and pretend as if they are comparing apples to apples. They are not; the attempt itself is inherently misleading.

Respondents seek to conflate the detection of cancer signals among previously diagnosed cancer patients (including many with Stage IV cancer) with the clinically relevant issue of an MCED test's capability to identify early-stage cancers in an asymptomatic screening population. Galleri is being developed (1) as a multi-cancer early detection test (2) for use in screening an asymptomatic population. (*See, e.g.*, RPFF ¶ 342 (stating that Galleri "is designed to detect cancer . . . before a patient ever shows symptoms")). The fact that Galleri can detect signals for certain cancers once those cancers reach Stage IV does not support Galleri's ability to detect those cancers early. (*See, e.g.*, CCFF ¶ 6233). Respondents' own expert conceded that Stage IV cancer "is almost always incurable and will eventually result in the death of the patient." (RX3869 (Cote Rebuttal Report) ¶ 31). Likewise, the fact that Galleri can detect signals for certain cancers among individuals who have already been diagnosed with cancer does not support Galleri's ability to detect those cancers in an asymptomatic screening population.

Grail has never demonstrated its Galleri MCED test can reliably detect 50 cancer types in an asymptomatic patient. There is no clinical evidence that Galleri can provide early detection of 50+ cancers in an asymptomatic population. Nor is there clinical evidence that Galleri can provide early detection of 20 cancers in an asymptomatic population, or ten, or even eight. As of

trial, Galleri had been clinically shown to detect only seven types of early stage cancer in an asymptomatic screening population–a fact conceded by Respondents' own expert. ((Cote Tr. 4000-4001) ("Q. So as of today, Galleri has been clinically shown to detect seven types of stage one through three cancer in an asymptomatic screening population, correct? A. That's correct."); *see generally* CCFF ¶¶ 6206-6394 (Appendix B: Galleri Has Not Been Clinically Shown to Provide Early Detection of More Than 50 Cancers in an Asymptomatic Population)).

The proposed finding is also incomplete and misleading to the extent it suggests that Galleri's cancer signal of origin ("CSO") performance has been clinically established in Galleri's intended use population. Reliable clinical data does not yet exist about how Grail's cancer signal of origin feature would perform in an asymptomatic screening population. [redacted]

[redacted]

726. In addition to obvious differences in the number of cancers detected, the nature of the testing and the ability to detect cancer signal of origin, there are significant differences between the specificity and sensitivity of the tests. (PFF ¶¶ 726.1–726.8.)

Response to Finding No. 726

[redacted]

[redacted]

726.1 For example, the specificity of Galleri is 99.5% compared to 95.3% for the single blood draw in CancerSEEK (the apples-to-apples comparison). While those numbers may seem close, the difference between them is huge in the context of a screening test. (*See* RX3869 (Cote Expert Report) ¶ 93.)

Response to Finding No. 726.1

[redacted]

[redacted]

[redacted]

[redacted]

726.2 The 4.2% difference means that for every 100,000 patients screened, an additional 4,200 people using CancerSEEK will receive a false positive result that they have cancer. (*See also* Cote Tr. 3779–81.)

Response to Finding No. 726.2

[redacted]

[redacted]

[redacted]

[redacted]

726.3 The specificity of CancerSEEK comes closer to Galleri only when an additional blood draw and full body PET-CT scan are added.

Response to Finding No. 726.3

[redacted]

[redacted]

726.4 The sensitivity of the tests is not at all comparable (51.5% as compared to 30.2%). (*See* RX3409 (Klein 2021) at 5; RX3419 (Lennon et al., 2020) at 7.) This means that when both tests are used in a random population, CancerSEEK will miss 20% more instances of cancer in patients than Galleri would. (*See* Cote Tr. 3778-79.)

Response to Finding No. 726.4

[redacted]

[redacted]

[redacted]

[redacted]

726.5 These metrics enable a calculation of positive predictive value ("PPV"): the percentage of participants with a positive test result who truly have the disease. (PX0043 (GRAIL) at 93; *see also* PX7103 (Jamshidi (GRAIL) Dep. at 136-37).)

Response to Finding No. 726.5

[redacted]

[redacted]

726.6 Any analysis of CancerSEEK's characteristics is premature, as Exact is going back to the drawing board with the test and "combining the Exact Sciences and Thrive approaches in one test." (RX4007 (Exact/Thrive) at 7.)

Response to Finding No. 726.6

[redacted]

[redacted]

726.7 [redacted]

Response to Finding No. 726.7

[redacted]

726.8 [redacted]

Response to Finding No. 726.8

[redacted]

727. Different uses. The Galleri test is recommended for use in asymptomatic adults aged 50 and older. (PX0043 (GRAIL) at 5.) It is intended to be used in addition to, and not to replace, other cancer screening tests. (Ofman (GRAIL) Tr. 3309–10.)

Response to Finding No. 727

The proposed finding is misleading to the extent it implies that Galleri's competitive have different customers. [redacted]

[redacted]

Therefore, this Court should disregard the proposed finding.

728. While we do not know exactly what the MCED tests in development will look like, if ever they launch, there is no question that the tests Complaint Counsel points to will be used very differently than Galleri. (PFF ¶¶ 728.1–**Error! Reference source not found.**.)

Response to Finding No. 728

The proposed finding should be disregarded because it is not a "finding of fact," but rather a legal conclusion in contravention of this Court's order and the Part 3 rules. (*See* 16 C.F.R. § 3.46; Order on Post-Trial Findings). This proposed finding is also incorrect in stating that there is "no question" that other tests will be used "differently than Galleri." Complaint Counsel absolutely contests this point and directs this Court to its Post-Trial Brief at Section II.B. and its Post-Trial Reply Brief at Section III.B.

The proposed finding is also vague and ambiguous because it claims that tests "will be used very differently" without any explanation. The proposed finding is also unsupported because no evidence is cited for the factual proposition. Therefore, this Court should disregard the proposed finding.

728.1 Most of the tests are single cancer tests to which the developer may use as a starting point for a test that includes an additional cancer or two in the future. (PFF ¶¶ 701–706.) [redacted]

Response to Finding No. 728.1

[redacted]

[redacted]

728.2 [redacted]

Response to Finding No. 728.2

[redacted]

[redacted]

[redacted]

[redacted]

729. The overwhelming evidence showed that the purported MCED tests cited by Complaint Counsel are likely to be used very differently from Galleri in the event of launch. (PFF ¶¶ 730–736.)

Response to Finding No. 729

[redacted]

[redacted]

730. [redacted]

Response to Finding No. 730

[redacted]

730.1 As Bill Getty explained, "Galleri is going after something very different, which is just a larger population, test for more things. We are saying use us for colorectal cancer screening ostensibly when we are commercialized." (PX7040 (Getty (Guardant) IHT at 155–56).)

Response to Finding No. 730.1

The proposed finding is vague, misleading, and against the weight of the evidence. The proposed finding is vague and misleading to the extent Respondents are implying that Guardant is not development an MCED test because Respondents have taken a quote from Guardant's Bill Getty out of context. Mr. Getty was only testifying about Guardant's LUNAR-2 colorectal test in the portion of testimony that Respondents cite. (*See* PX7040 (Getty (Guardant) IHT at 155–56)). As a single-cancer test, the weight of the evidence shows that single-cancer tests, like Guardant's colorectal only test, will not compete with MCED tests. (*See* CCFF ¶¶ 660-87).

732. Helio. [redacted]

Response to Finding No. 732

[redacted]

[redacted]

732.1 Helio had previously developed a multi-cancer screening test called IvyGene but has since abandoned those efforts. (PFF ¶ 501.1.)

Response to Finding No. 732.1

This proposed finding is unsupported by factual evidence as it simply references another of Respondent's proposed findings. It also appears to be incorrect. When Helio operated under the name of LAM, Helio used the name "IvyGene" for the liver cancer screening tests now known as HelioLiver. (Chahine (Helio) Tr. 1001-02). Therefore, this Court should disregard the proposed finding.

732.2 Helio has only ever studied five cancers: breast, colon, liver, nasopharyngeal and lung. (RX3302 (Hao et al., 2017) at 1; RX3616 (Roy et al., 2019).)

Response to Finding No. 732.2

This proposed finding is relying on hearsay evidence and is misleading. The two documents Respondents cite above are academic articles reporting on studies of Helio's technology in breast, colon, liver, nasopharyngeal and lung cancers. It does not provide any evidence of Helio's internal research and development program. To the extent Respondents are relying upon these journal articles to prove the extent of Helio's internal research program it is unreliable hearsay evidence and should be given no weight. Therefore, this Court should disregard the proposed finding.

733.2 [redacted]

Response to Finding No. 733.2

[redacted]

[redacted]

[redacted]

733.3 A test developer focusing on a single cancer screening test or a test directed to only a handful of targeted cancer types may elect to focus on the test's sensitivity, so it can serve as a "rule-out" test that does not require follow-up to confirm a negative result. As a corollary, in such tests, a lower level of specificity (and increase in the false-positive rate) can be tolerated, especially where there is a standard of care screening available that a doctor can reflex to, such as colonoscopy. (Cote Tr. 3829; RX3869 (Cote Expert Report) ¶ 95.)

Response to Finding No. 733.3

The proposed finding is unsupported as the only citations are to the unreliable and unqualified opinion testimony of Dr. Cote. [redacted]

[redacted] Therefore, this Court should disregard the proposed finding.

734. FMI. FMI admittedly has no test. [redacted] (PX7074 (Perettie (FMI) Dep. at 79–80).) [redacted]

Response to Finding No. 734

[redacted]

[redacted]

735. Exact/Thrive. Exact/Thrive's CancerSEEK requires three separate tests to conclude a positive sample: first, a patient takes a baseline blood test, and if that returned a positive result, they then had a confirmation blood test. (Lengauer (Exact/Thrive) Tr. 246–48.) If both the baseline and the confirmatory blood tests were positive, then a patient would have to undergo a diagnostic full-body PET-CT scan to confirm the results of the blood testing and also to localize the potential cancer. (Lengauer (Exact/Thrive) Tr. 246–48.) [redacted]

Response to Finding No. 735

[redacted]

[redacted]

[redacted]

736. Singlera. Singlera's PanSeer assay has been shown to detect five types of cancer at 96.1% specificity in a retrospective, observational study of 418 participants. (RX3115 (Chen et al., 2020) at 1, 3.) On that measure alone, it is likely that Singlera would not be used in the same target population as Galleri. [redacted]

Response to Finding No. 736

[redacted]

[redacted]

737. This is further confirmed by the fact that any patient testing positive on PanSeer would then undergo an additional blood test and/or follow-up imaging to allow tissue of origin mapping. (RX3115 (Chen et al 2020) at 6).)

Response to Finding No. 737

The proposed finding is unsupported and incorrect. Despite the ample evidence provided by Singlera, Respondents are citing a document not produced by the company. The proposed finding is incorrect to the extent Respondents are implying that Singlera is not offering tissue of origin capabilities with its PanSeer MCED test. Singlera's Scientific Advisor and former Chairman, Dr. Gary Gao, clearly testified that the PanSeer MCED test is designed to detect the tissue of origin. (Gao (Singlera) Tr. 2874). The document cited by Respondents merely suggest Singlera used an alternative means of identifying the tissue of origin during a clinical study using Singlera's PanSeer test.

Further, the proposed finding is incomplete and misleading to the extent Respondents are drawing a distinction with Grail's Galleri's cancer signal of origin ("CSO") performance by implying it has been clinically established in Galleri's intended use population. Reliable clinical data does not yet exist about how Grail's cancer signal of origin feature would perform in an asymptomatic screening population.

The CCGA study did not involve a real-world population, but rather was a case-control study that involved individuals who had already been diagnosed with cancer. (*See* CCFF ¶¶ 6238-6241). Grail's Chief Medical Officer, Dr. Ofman, conceded at trial that the CCGA study did not involve the intended use population for Galleri. (Ofman (Grail) Tr. 3294-95). The authors of the Grail's CCGA-2 and CCGA-3 sub-studies themselves acknowledge that CCGA is not reflective of performance in a screening population. (RX3430 at 10 (M.C. Liu, et al.,

Sensitive and Specific Multi-Cancer Detection and Localization Using Methylation Signatures in Cell-Free DNA, 6 Annals of Oncology 745 (2020) [CCGA-2] ("[T]o understand [Galleri's] performance in an asymptomatic screening population will require additional studies" beyond CCGA.")); (RX3409 at 010 (E.A. Klein, et al., Clinical Validation of a Targeted Methylation-Based Multi-Cancer Early Detection Test Using an Independent Validation Set, 9 Annals of Oncology 1167 (2021) [CCGA-3] ("CCGA is a case-control study, and as such, is not reflective of performance in a screening population.")). Among other factors, some of the blood samples in CCGA were "collected from participants with cancer after biopsies had been carried out," which the authors note "could increase the possibility that the tumor cfDNA fraction may increase relative to before the biopsy." This Court should disregard the proposed finding.

738. [redacted] But the patient experience with the only version of the CancerSEEK test for which Exact/Thrive has published any data is very different from that same patient's experience with Galleri [redacted]

Response to Finding No. 738

[redacted]

[redacted]

739. The version of CancerSEEK used in the DETECT-A study consisted of three separate tests—two blood draws and a PET-CT scan that must each be collected at a different time (Lengauer (Exact/Thrive) Tr. 246–48)—makes it very different from Galleri, which consists of one blood draw that can be conducted as part of an annual physical exam. (PX0043 (GRAIL) at 112, 114.)

Response to Finding No. 739

The proposed finding should be disregarded because it is not a "finding of fact," but rather a legal conclusion in contravention of this Court's order and the Part 3 rules. (*See* 16 C.F.R. § 3.46; Order on Post-Trial Findings). Respondents have merely recited a portion of their own Post-Trial Brief—in effect representing their argument as a "fact." (*See* Resp.'s Post-Trial Brief at 53). Their only support for this alleged "fact" are testimony from Thrive's Christoph Lengauer testifying about a clinical trial on its CancerSEEK MCED test and Grail's own S-1 Form submitted to the SEC in September 2020. There is no citation to support an assertion that

Thrive's CancerSEEK is "very different" from Grail's Galleri.

Furthermore, Grail even identifies Thrive and its CancerSEEK MCED test as one of its competitors in this same S-1 Form. (PX0043 (Grail) at 033 ("We have competitors both in the United States and abroad, including . . . Thrive Earlier Detection, Corp.")). This is consistent with other evidence from Grail that identifies Thrive as its competitors. [redacted]

The proposed finding is also misleading to the extent it suggests that Galleri's algorithmic cancer signal of origin prediction is capable of definitively localizing cancer "through liquid biopsy alone." Reliable clinical data does not exist about how Grail's cancer signal of origin feature would perform in an asymptomatic screening population. [redacted]

[redacted] Additionally, a positive Galleri result "requires confirmatory diagnostic evaluation by medically established procedures (e.g. imaging) to confirm cancer," *notwithstanding* Galleri's "cancer signal of origin" feature. (PX0063 at 002 (Grail, https://grail.com/galleri/, accessed on Apr. 29, 2021). Indeed, Grail's CEO, Hans Bishop, admitted at trial that certain patients may have to undergo a body scan following a positive Galleri test to identify the cancer tissue of origin. (Bishop (Grail) Tr. 1387.)

Interim results from PATHFINDER, an actual interventional trial for Galleri, indicate that additional imaging testing was required for positive results 90 percent of the time. (RX3041 at 001 (Tomasz M. Beer, Interim Results of PATHFINDER, a Clinical Use Study Using a Methylation-Based Multi-Cancer Early Detection Test, 2021 ASCO Annual Meeting Presentation, June 4, 2021) ("Most participants with diagnostic resolution had at least 1 imaging test (57/63; 90%)."). Over half the positive results in PATHFINDER with diagnostic resolution were determined to be false positives (55.4%) and 25 percent of participants who received falsely positive results underwent at least one invasive procedure. (RX3041 at 004 (Tomasz M. Beer, Interim Results of PATHFINDER, a Clinical Use Study Using a Methylation-Based Multi-Cancer Early Detection Test, 2021 ASCO Annual Meeting Presentation, June 4, 2021)).

[redacted]

[redacted]

740. Moreover, a comparison between Galleri and the first blood draw in CancerSEEK further shows the significant differences between them. As shown in the table below, the performance of Galleri is superior to CancerSEEK's single blood draw:

Table 8

Test	Galleri	CancerSEEK 1 Blood Test
Study	CCGA3	DETECT-A
Types of Cancer	50	10
Cancer Signal of Origin	Yes	No
Specificity	99.5%	95.3%
Sensitivity	51.5%	30.2%
PPV	44.4%	5.9%

(*See* RX3409 (Klein 2021) at 5; RX3419 (Lennon et al., 2020) at 7).)

Response to Finding No. 740

The proposed finding should be disregarded because it is not a "finding of fact," but rather a legal conclusion in contravention of this Court's order and the Part 3 rules. (*See* 16 C.F.R. § 3.46; Order on Post-Trial Findings). Respondents have merely recited a portion of their own Post-Trial Brief—in effect representing their argument as a "fact." (*See* Resp.'s Post-Trial Brief at 53-54). Their only support for this alleged "fact" are copies of clinical reports done by Thrive and Grail on their respective MCED tests in development. There is no citation to support

Respondents' assertions that there are "significant differences between" Thrive's CancerSEEK and Grail's Galleri or that "the performance of Galleri is superior to CancerSEEK's single blood draw." These are merely legal arguments from Respondents that they have falsely claimed as "facts."

Respondents also rely on a table that they appear to have constructed and included in their proposed finding. The proposed finding is misleading because the weight of the evidence shows that the CCGA study is not indicative of Galleri's performance in the intended use (asymptomatic) population as explained below. Any attempt to compare directly the results in DETECT-A (an interventional study involving asymptomatic individuals) with CCGA (a case-control study involving diagnosed cancer patients, including patients with Stage IV cancer) meaningless and inherently unreliable. They are fundamentally different types of studies. Dr. Ofman of Grail conceded that "[t]o find all 50 cancer types in a real-world population would require hundreds of thousands of people[.]" (RPFF ¶ 398.4 (quoting Ofman (Grail) Tr. 3298).

[redacted]

The authors of the CCGA-3 sub-study itself make this point explicitly in their article, cautioning that "CCGA is a case-control study, and as such, is not reflective of performance in a screening population." (RX3409 at 010 (E.A. Klein, et al., Clinical Validation of a Targeted Methylation-Based Multi-Cancer Early Detection Test Using an Independent Validation Set, 9 Annals of Oncology 1167 (2021)). The authors of the CCGA-2 sub-study provide the same caveat about CCGA, stating: "to understand [Galleri's] performance in an asymptomatic screening population will require additional studies" beyond CCGA. (RX3430 at 10 (M.C. Liu, et al., Sensitive and Specific Multi-Cancer Detection and Localization Using Methylation Signatures in Cell-Free DNA, 6 Annals of Oncology 745 (2020)). Accordingly, Grail cannot say today what the sensitivity of its MCED test will be in Galleri's intended use population (i.e. in an asymptomatic screening population).

To put the above points plainly, a case control study will tend to produce inflated

performance results relative to how a test would performance in an asymptomatic screening population (the actual population in which MCED tests are intended to be used). Notwithstanding this, and notwithstanding the above admissions, Respondents nonetheless attempt to compare their case-control results to results from studies involving asymptomatic populations and pretend as if they are comparing apples to apples. They are not; the attempt itself is inherently misleading.

With respect to Grail's Galleri, the proposed finding is also misleading and incorrect to the extent Respondents are implying, as they do in their table, that Grail's Galleri can detect 50 cancers in an asymptomatic patient. [redacted]

The proposed finding is also incomplete and misleading to the extent it suggests, as it does in the table presented, that Galleri's cancer signal of origin ("CSO") performance has been clinically established in Galleri's intended use population. Reliable clinical data does not yet

exist about how Grail's cancer signal of origin feature would perform in an asymptomatic screening population.

The proposed finding is also against the weight of the evidence that shows Grail routinely referring to Thrive and its CancerSEEK MCED as its competitor. [redacted]

740.1 [redacted]

Response to Finding No. 740.1

[redacted]

[redacted]

[redacted]

c. Unique production facilities

741. [redacted]

Response to Finding No. 741

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3.

Here Respondents cite Dr. Cote as the only source of evidence supporting the proposed fact in contravention of this Court's Order. This Court should disregard this proposed finding. The proposed finding is also vague as it is unclear what "differences in how Grail is produced" this finding references. The proposed finding is also misleading to the extent Respondents intend to imply that the alleged differences in production facilities mean indicate that that Galleri is not in the same relevant market as other MCED test developers. As Complaint Counsel's Post-Trial Reply Brief explains, Respondents misapply this *Brown Shoe* factor. (Complaint Counsel's Post-Trial Reply Brief at Section I.B.).

741.1 As Nicole Berry explained, "[t]he mechanism by which a test provider translates the variant calls or the presence of absence of a combination of biomarkers into a clinically relevant conclusion is typically part of the proprietary piece of the workflow." (Berry (Illumina) Tr. 822.)

Response to Finding No. 741.1

This proposed finding is vague. It is unclear what is meant by a "clinically relevant conclusion." Otherwise, Complaint Counsel has no specific response to this proposed finding.

741.2 According to Ken Chahine, "[t]he magic occurs in basically deciphering the information you get back from that sequencing machine and determining what algorithm may or may not predict whether someone has cancer." (Chahine (Helio) Tr. 1015.)

Response to Finding No. 741.2

Complaint Counsel has no specific response to this proposed finding.

741.3 As part of the CCGA study, GRAIL determined that the most appropriate biomarker to identify early cancer through blood tests were methylation sites, in which plasma cfDNA is subjected to bisulfite conversion, prepared as a dual indexed sequencing library and enriched using standard hybridization capture conditions, followed by paired-end sequencing. (*See* RX3430 (Liu et al 2020) at 5.)

Response to Finding No. 741.3

[redacted]

[redacted]

741.4 GRAIL developed a proprietary method for library preparation to efficiently prepare methylated DNA fragments for sequencing, and then developed proprietary machine learning algorithms to take those methylation signals and make a prediction about whether or not a patient has cancer, and if they do, what type of cancer. (Aravanis (Illumina) Tr. 1887.)

Response to Finding No. 741.4

[redacted]

[redacted]

[redacted]

741.5 This approach is unique to GRAIL, [redacted]; Aravanis (Illumina) Tr. 1883 ("So the methylation patterns between different cancers can be quite different. Methylation patterns actually within a cancer, even of the same type that looks the same, can also be quite different. And this is actually why you need so many markers, which is that you need many markers to be able to understand which type of cancer, to distinguish it from someone who doesn't have cancer.").)

Response to Finding No. 741.5

[redacted]

741.5.1 There are about 30 million methylation sites in the human genome, and Galleri uses about one million of those. (Aravanis (Illumina) Tr. 1882–83; [redacted]

Response to Finding No. 741.5.1

This proposed finding is inaccurate. [redacted] Dr. Aravanis [redacted] testified that there are approximately one million methylation markers in the human genome informative for cancer, not that Galleri uses all of them. Therefore, this Court should disregard the proposed finding.

742. The library preparation and back-end algorithms used by the other putative MCED test developers are different from GRAIL's. (PFF ¶¶ 742.1–742.4.)

Response to Finding No. 742

[redacted]

742.1 Exact/Thrive is focusing only on 16 gene mutations and nine protein sites to screen for ten cancers. (*See* RX3419 (Lennon et al., 2020) at 4.)

Response to Finding No. 742.1

[redacted]

742.2 [redacted]

Response to Finding No. 742.2

[redacted]

742.3 Freenome's approach combines data from whole-genome sequencing, DNA methylation, and protein quantification using a multiomics approach. (RX3426 (Lin et al., 2021); RX3592 (Putcha et al., 2020).) [redacted]

[redacted]

d. Distinct customers

743. But what is clear already (and Complaint Counsel has not demonstrated otherwise) is that these tests will have different indications, and therefore distinct customers, from Galleri.

Response to Finding No. 743

This proposed finding is unsupported by any evidence and should be disregarded. The

proposed finding also should be disregarded because it is not a "finding of fact," but rather a legal conclusion in contravention of this Court's order and the Part 3 rules. (*See* 16 C.F.R. § 3.46; Order on Post-Trial Findings). It is also incorrect insofar as it suggests that Complaint Counsel is has "not demonstrated otherwise." (*See* Complaint Counsel's Post-Trial Brief at Section II.B. and Complaint Counsel's Post-Trial Reply Brief at Section III.B.). Therefore, this Court should disregard the proposed finding.

744. The Galleri test can detect the presence of more than 50 cancers as well as the cancer signal of origin in positive cases. GRAIL expects Galleri will be ordered annually as part of a patient's annual physical exam. (PX0043 (GRAIL) at 112, 114.) The test is likely to be of interest to anyone above 50 who wishes to know whether they have cancer, regardless of location in the body, at an early stage through a single blood draw, without any need for a PET-CT scan and the risks such scans entail. (*See* Aravanis (Illumina) Tr. 1921–22; Ofman (GRAIL) Tr. 3315; Cote Tr. 3812.)

Response to Finding No. 744

The proposed finding is unsupported, misleading, and against the weight of the evidence. There is no clinical evidence that Galleri can provide early detection of 50+ cancers in an asymptomatic population. [redacted]

Respondents seek to conflate the detection of cancer signals among previously diagnosed cancer patients (including many with Stage IV cancer) with the clinically relevant issue of an MCED test's capability to identify early-stage cancers in an asymptomatic screening population.

Galleri is being developed (1) as a multi-cancer early detection test (2) for use in screening an asymptomatic population. (*See*, e.g., RPFF ¶ 342 (stating that Galleri "is designed to detect cancer . . . before a patient ever shows symptoms")). The fact that Galleri can detect signals for certain cancers once those cancers reach Stage IV does not support Galleri's ability to detect those cancers early. (*See*, e.g., CCFF ¶ 6223). Respondents' own expert conceded that Stage IV cancer "is almost always incurable and will eventually result in the death of the patient." (RX3869 (Cote Rebuttal Report) ¶ 31). Likewise, the fact that Galleri can detect signals for certain cancers among individuals who have already been diagnosed with cancer does not support Galleri's ability to detect those cancers in an asymptomatic screening population.

Grail has released results from two clinical studies of Galleri: the CCGA study and the PATHFINDER study. (Aravanis (Illumina) Tr. 1891-92; Cote, Tr. 3993). The CCGA study did not involve a real-world population but rather was a case-control study that assessed Galleri's ability to detect cancer signals in individuals who had already been diagnosed with cancer. (*See* CCFF ¶¶ 6238-6241). Grail's Chief Medical Officer, Dr. Ofman, conceded at trial that the CCGA study did not involve the intended use population for Galleri. (Ofman (Grail) Tr. 3294-95). The authors of the CCGA-3 sub-study – which Respondents rely upon for their 50-cancer claims – make this point explicitly in their article, cautioning that "CCGA is a case-control study, and as such, is not reflective of performance in a screening population." (RX3409 at 010 (E.A. Klein, et al., Clinical Validation of a Targeted Methylation-Based Multi-Cancer Early Detection Test Using an Independent Validation Set, 9 Annals of Oncology 1167 (2021)). The authors of the CCGA-2 sub-study provide the same caveat about CCGA, stating: "to understand [Galleri's] performance in an asymptomatic screening population will require additional studies" beyond CCGA. (RX3430 at 10 (M.C. Liu, et al., Sensitive and Specific Multi-Cancer Detection

and Localization Using Methylation Signatures in Cell-Free DNA, 6 Annals of Oncology 745 (2020)). The only other study of Galleri for which interim results have been released, PATHFINDER, likewise fails to support the notion that Galleri can provide early detection of 50+ cancers in an asymptomatic population. Grail's Chief Medical Officer, Dr. Ofman, acknowledged the challenges associated with generating the clinical evidence necessary to actually support a 50-cancer early screening claim when he admitted: "To find all 50 cancer types in a real-world population would require hundreds of thousands of people, and PATHFINDER was not designed to do that." (RPFF ¶ 398.4 (quoting Ofman (Grail) Tr. 3298). Based on the PATHFINDER study, the Galleri test has been shown to detect seven types of Stage I-III cancer in an asymptomatic screening population. (Cote Tr. 4000-01; RX3041 at 005 (Tomasz Beer, Interim Results of Pathfinder, a Clinical Use Study Using a Methylation-Based Multi-Cancer Early Detection Test, June 4, 2021).

The implication a patient will only be willing to order a MCED if it does not involve a PET-CT scan is only supported by the biased testimony of Dr. Ofman and Dr. Aravanis and is contradicted by the weight of the record. The proposed finding is also misleading to the extent it implies that Galleri can reliably detect the tissue of origin. [redacted] Grail's CEO, Hans Bishop, testified at trial that certain patients may have to undergo a body scan following a positive Galleri test to identify the cancer tissue of origin. (Bishop (Grail) Tr. 1387). The authors of Grail's CCGA-3 substudy also acknowledge that individuals who receive a positive Galleri result "may require a whole-body computed tomography (CT) or positron emission tomography (PET)-

CT scan to localize the primary tumor." (RX3409 at 009 (E.A. Klein, et al., Clinical Validation of a Targeted Methylation-Based Multi-Cancer Early Detection Test Using an Independent Validation Set, 9 Annals of Oncology 1167 (2021)). [redacted]

Grail undertook the PATHFINDER study to assess the extent and types of diagnostic testing that will be required to achieve diagnostic resolution following a positive Galleri result and tissue of origin prediction. (*See* RPFF ¶ 395 ("PATHFINDER's primary goal is to assess the extent and types of diagnostic testing required to achieve a diagnostic resolution after a patient has received a cancer screening test result that indicates 'Signal Detected', meaning the potential presence of cancer, along with a predicted or indeterminate tissue of origin.")). If Grail had already established the extent to which PET-CT and other types of diagnostic testing would be required to achieve diagnostic resolution when Galleri is used in a real-world setting, such a study would not be necessary. Interim results from PATHFINDER indicate that additional imaging testing was overwhelmingly required to achieve diagnostic resolution for patients who received positive Galleri results. According to the preliminary results of PATHFINDER, "[m]ost participants with diagnostic resolution had at least 1 imaging test (57/63; 90%)." RX3041 at 001 (Tomasz M. Beer, Interim Results of PATHFINDER, a Clinical Use Study Using a Methylation-Based Multi-Cancer Early Detection Test, 2021 ASCO Annual Meeting Presentation, June 4, 2021) (the presentation fails to disclose the share of imaging tests that were PET-CT tests). Over half of positive results in PATHFINDER were false positives; 25 percent of participants who

received falsely positive Galleri results wound up undergoing at least one invasive procedure. RX3041 at 003 (Tomasz M. Beer, Interim Results of PATHFINDER, a Clinical Use Study Using a Methylation-Based Multi-Cancer Early Detection Test, 2021 ASCO Annual Meeting Presentation, June 4, 2021)).

[redacted] Therefore, this Court should disregard the proposed finding.

745. In contrast an MCED test capable of detecting only two or three cancer types would be used only by customers with reason to suspect susceptibility to the few cancers the test could detect, [redacted]

Response to Finding No. 745

[redacted]

[redacted]

746. [redacted]

Response to Finding No. 746

[redacted]

[redacted]

e. Distinct prices

747. At present, Galleri is the only MCED test with a price, currently selling for $949, (Bishop (GRAIL) Tr. 1322) [redacted]

Response to Finding No. 747

[redacted]

[redacted]

748. It is virtually impossible to compare Galleri to tests not yet in existence: as Bill Getty of Guardant testified, "[i]n the context of the blood-based screening market, which is yet to evolve to its maturity, it would be very difficult to speculate about the relevancy of price." (PX7105 (Getty (Guardant) Dep. at 106–07).)

Response to Finding No. 748

This proposed finding is misleading because in the overall context of the question, Mr. Getty was being asked about a much broader market than MCED tests. The first question from Respondent's counsel asked Mr. Getty about the "oncology testing space" and the second question asked him about "blood-based screening market." (PX7105 (Getty (Guardant) Dep. at

106–07). Mr. Getty appeared confused and asked counsel for clarification in between the two questions. [redacted] By grouping different products with different functionalities together of course Mr. Getty testified that it "is difficult to speculate about the relevancy of price." This Court should disregard the proposed finding.

749. Complaint Counsel failed to show that any will have a similar price point to Galleri. (PFF ¶¶ 750.1–750.4.)

Response to Finding No. 749

This proposed finding is unsupported by any evidence as Respondents merely cited to another section of their findings and should be disregarded. [redacted] Therefore, this Court should disregard the proposed finding.

750. None of the putative MCED tests has a published price and no test developer has determined what the price of a putative MCED test might be. (PFF ¶¶ 750.1–750.4.)

Response to Finding No. 750

[redacted]

[redacted]

750.1 Singlera has said that it "couldn't know right now" at what price Singlera plans to market PanSeer. (PX7042 (Gao (Singlera) IHT at 99).)

Response to Finding No. 750.1

The proposed finding is misleading and out of context. Mr. Gao clarified that while he did not know the exact price, he did not know it would sell for less than $1,000 in the United States. (PX7042 (Gao (Singlera) IHT at 99). Moreover, this finding is misleading to the extent that it implies that there will not be price competition between the Galleri test and the PanSeer test. Rather, as Mr. Gao explains in that same investigational hearing transcript, "[e]very single company has to compete on that price front" with Grail's Galleri test. (PX7042 (Gao (Singlera) IHT at 99). **Therefore**, this Court should disregard the proposed finding.

750.2 [redacted]

Response to Finding No. 750.2

[redacted]

[redacted]

750.3 [redacted]

Response to Finding No. 750.3

[redacted]

[redacted]

[redacted]

[redacted]

750.4 There is no evidence to suggest any other putative MCED developer has made any determination on the price of any putative test that detects multiple cancer types. [redacted]

Response to Finding No. 750.4

[redacted]

[redacted]

751. While none of the putative MCED tests in development has an established price point, if they do not launch with comparable characteristics as Galleri, such as the number of cancers detected or the ability to detect cancer signal of origin, the evidence suggests they will not share the same price as Galleri. [redacted]

Response to Finding No. 751

[redacted]

[redacted]

[redacted]

f. Sensitivity to price changes

752. Just as it is impossible to compare the price of Galleri to the prices of tests not yet in the market, it is impossible today to say whether the price of Galleri will be sensitive to the availability and pricing of the putative tests in development. (*See* Getty (Guardant) Tr. 2678 ("Q. Based on what you know about healthcare markets and your determinations about competition between LUNAR-2 and Galleri, once LUNAR-2 is on the market at a given price, if that price were to increase by, let's say, $10, you could not say one way or another that that increase would cause doctors to prefer Galleri over LUNAR-2; right? A. No. Q. In other words, what I've just asked you is correct; you agree with my statement. A. Yes, I do.").)

Response to Finding No. 752

[redacted]

[redacted]

753. [redacted]

[redacted]

Response to Finding No. 753

[redacted]

[redacted]

754. On top of that, there is no record evidence that an increase in price to the 50-cancer test is likely to cause consumers to switch to a two- or three-cancer test. (RX6004 (Katz Trial Dep. at 18).)

Response to Finding No. 754

The proposed finding is unsupported, misleading, and against the weight of the evidence. The proposed finding is unsupported to the extent it relies on the impermissible opinion of Dr. Katz and is based on an incomplete hypothetical that does not reflect market realities.

Dr. Katz's opinion is unreliable and should disregarded. Dr. Katz normally spends approximately three to four hundred hours preparing for an expert report in a matter. (RX6004 (Katz Trial Dep. at 135-136)). Here, Dr. Katz only billed forty to fifty hours. (RX6004 (Katz Trial Dep. at 137)). In total, Dr. Katz allegedly considered over 6,533 pages of material in approximately forth to fifty hours. (RX6004 (Katz Trial Dep. at 137-141)). In effect, this means that he spent approximately less than half a minute per page in reviewing the materials listed on his materials considered list. (PX6105 (Katz Expert Report) at 017-023). [redacted]

[redacted] Given the unreliable nature of Dr. Katz's opinion as well as Respondents' complete disregard of this Court's order, Dr. Katz's opinion should be disregarded.

Dr. Katz's opinion is should also be disregarded given that it is based on an incomplete hypothetical that is not based on market realities. There is no clinical evidence that Galleri can provide early detection of 50+ cancers in an asymptomatic population. Nor is there clinical evidence that Galleri can provide early detection of 20 cancers in an asymptomatic population, or ten, or even eight. As of trial, Galleri had been clinically shown to detect only seven types of early stage cancer in an asymptomatic screening population – a fact conceded by Respondents' own expert. ((Cote Tr. 4000-4001) ("Q. So as of today, Galleri has been clinically shown to detect seven types of stage one through three cancer in an asymptomatic screening population, correct? A. That's correct."); *see generally* CCFF ¶¶ 6206-6394 (Appendix B: Galleri Has Not Been Clinically Shown to Provide Early Detection of More Than 50 Cancers in an Asymptomatic Population)).

Respondents seek to conflate the detection of cancer signals among previously diagnosed cancer patients (including many with Stage IV cancer) with the clinically relevant issue of an MCED test's capability to identify early-stage cancers in an asymptomatic screening population. [redacted] The fact that Galleri can detect signals for certain cancers once those cancers reach Stage IV does not support Galleri's ability to detect

those cancers early. (*See, e.g.,* CCFF ¶ 6223). Respondents' own expert conceded that Stage IV cancer "is almost always incurable and will eventually result in the death of the patient." (RX3869 (Cote Rebuttal Report) ¶ 31). Likewise, the fact that Galleri can detect signals for certain cancers among individuals who have already been diagnosed with cancer does not support Galleri's ability to detect those cancers in an asymptomatic screening population.

Grail has released results from two clinical studies of Galleri: the CCGA study and the PATHFINDER study. (Aravanis (Illumina) Tr. 1891-92; Cote, Tr. 3993). [redacted] Grail's Chief Medical Officer, Dr. Ofman, conceded at trial that the CCGA study did not involve the intended use population for Galleri. (Ofman (Grail) Tr. 3294-95). The authors of the CCGA-3 sub-study – which Respondents rely upon for their 50-cancer claims – make this point explicitly in their article, cautioning that "CCGA is a case-control study, and as such, is not reflective of performance in a screening population." (RX3409 at 010 (E.A. Klein, et al., Clinical Validation of a Targeted Methylation-Based Multi-Cancer Early Detection Test Using an Independent Validation Set, 9 Annals of Oncology 1167 (2021)). The authors of the CCGA-2 sub-study provide the same caveat about CCGA, stating: "to understand [Galleri's] performance in an asymptomatic screening population will require additional studies" beyond CCGA. (RX3430 at 10 (M.C. Liu, et al., Sensitive and Specific Multi-Cancer Detection and Localization Using Methylation Signatures in Cell-Free DNA, 6 Annals of Oncology 745 (2020)). The only other study of Galleri for which interim results have been released, PATHFINDER, likewise fails to support the notion that Galleri can provide early detection of 50+ cancers in an asymptomatic population. Grail's Chief Medical Officer, Dr. Ofman,

acknowledged the challenges associated with generating the clinical evidence necessary to actually support a 50-cancer early screening claim when he admitted: "To find all 50 cancer types in a real-world population would require hundreds of thousands of people, and PATHFINDER was not designed to do that." (RPFF ¶ 398.4 (quoting Ofman (Grail) Tr. 3298). Based on the PATHFINDER study, the Galleri test has been shown to detect seven types of Stage I-III cancer in an asymptomatic screening population. (Cote Tr. 4000-01; RX3041 at 005 (Tomasz Beer, Interim Results of Pathfinder, a Clinical Use Study Using a Methylation-Based Multi-Cancer Early Detection Test, June 4, 2021).

[redacted]

Therefore, this Court should disregard the proposed finding.

755. In any case, Complaint Counsel did not undertake any study concerning the price sensitivity of Galleri or any of the purported MCED tests in development. (RX6004 (Katz Trial Dep. at 20-23).)

Response to Finding No. 755

This finding is only supported by the impermissible expert opinion of Dr. Katz. [redacted]

[redacted] Given that that the sole support for this finding is Dr. Katz's impermissible opinion, this finding of fact should be disregarded in its entirety.

Aside from violating this Court's order, Dr. Katz's opinion is also inherently unreliable. Dr. Katz normally spends approximately three to four hundred hours preparing for an expert report in a matter. (RX6004 (Katz Trial Dep. at 135-136)). Here, Dr. Katz only billed forty to fifty hours. (RX6004 (Katz Trial Dep. at 137)). In total, Dr. Katz allegedly considered over 6,533 pages of material in approximately forth to fifty hours. (RX6004 (Katz Trial Dep. at 137-141)). In effect, this means that he spent approximately less than half a minute per page in reviewing the materials listed on his materials considered list. (PX6105 (Katz Expert Report) at 017-023). Given his cursory review of the record, his opinion in this case is inherently unreliable and should be disregarded. [redacted]

[redacted] Given the unreliable nature of Dr. Katz's opinion as well as Respondents' complete disregard of this Court's order, Dr. Katz's opinion should be disregarded.

Finally, the proposed finding is also misleading to the extent Respondents are implying that Complaint Counsel has not [redacted] Therefore, this Court should disregard the proposed finding.

755.1 Indeed, they did not offer any evidence at all that the prices of Galleri will be sensitive to the changes in the prices of the MCED tests in development. (RX6004 (Katz Trial Dep. at 20-23).)

Response to Finding No. 755.1

This finding is only supported by the impermissible expert opinion of Dr. Katz. [redacted] Given that that the sole support for this finding is Dr. Katz's impermissible opinion, this finding of fact should be disregarded in its entirety.

Aside from violating this Court's order, Dr. Katz's opinion is also inherently unreliable. Dr. Katz normally spends approximately three to four hundred hours preparing for an expert

report in a matter. (RX6004 (Katz Trial Dep. at 135-136)). Here, Dr. Katz only billed forty to fifty hours. (RX6004 (Katz Trial Dep. at 137)). In total, Dr. Katz allegedly considered over 6,533 pages of material in approximately forth to fifty hours. (RX6004 (Katz Trial Dep. at 137-141)). In effect, this means that he spent approximately less than half a minute per page in reviewing the materials listed on his materials considered list. (PX6105 (Katz Expert Report) at 017-023).

[redacted] Given the unreliable nature of Dr. Katz's opinion as well as Respondents' complete disregard of this Court's order, Dr. Katz's opinion should be disregarded.

Finally, the proposed finding is also misleading to the extent Respondents are implying that Complaint Counsel has not [redacted]

[redacted] Therefore, this Court should disregard the proposed finding.

756. It is undisputed that an MCED test's price will in part depend on the level of payor adoption, and that payor adoption will in large part depend on the development of extensive evidence to establish clinical utility of a MCED test. (*See* RX3867 (Deverka Expert Report) ¶ 92.)

g. Specialized vendors

757. While all purported MCED tests except for Galleri are still in early stages of development, all available evidence indicates that Galleri and the purported MCED tests in development have unique attributes which involve specialized vendors.

Response to Finding No. 757

This proposed finding unsupported by any evidence, let alone "all available evidence," should be disregarded.

758. Different vendors provide different medical services to patients. For example, a blood test may be performed in a physician's office by a phlebotomist, (RX3869 (Cote Expert Report) ¶ 127), while imaging or other scanning must be performed in a specialist offices and through other means, (Aravanis (Illumina) Tr. 1829–30; Berry (Illumina) Tr. 814–16.)

Response to Finding No. 758

The proposed finding of fact is vague, misleading, and contradicted by the overwhelming weight of the evidence. This finding is vague because it's unclear what is meant by "different vendors" and "different medical services". This finding is also unsupported by the underlying citations as neither Dr. Aravanis nor Ms. Berry testified that imaging or scanning must be performed in a specialist offices or through other means. Given that this finding has no support it should be disregarded in its entirety. Moreover, the proposed finding is misleading to the extent it implies that the Galleri test will not need follow-up diagnostic work. As the Grail website explains, "A test result of 'Cancer Signal Detected' requires confirmatory diagnostic evaluation by medically establishing procedures (*e.g.* imaging) to confirm cancer." (PX0063 at 001 (Grail, Galleri Multi-Cancer Early Detection Test, https://grail.com/galleri/ (last visited Apr. 29, 2021))). [redacted]

[redacted]

759. Because the Galleri test is exclusively a blood test, it can be performed in a single physician's office alone. (*See* Bishop (GRAIL) Tr. 1402–03.)

Response to Finding No. 759

[redacted]

[redacted]

760. By contrast, Thrive's CancerSEEK assay entails at least two separate tests: one blood draw and the use of a PET-CT scan to confirm positive results and determine cancer signal of origin. (Lengauer (Exact/Thrive) Tr. 248–49.)

Response to Finding No. 760

[redacted]

[redacted]

761. Similarly, based on the current published data, a patient with a positive result from Singlera's PanSeer test could potentially undergo follow-up imaging to allow tissue of origin mapping. (RX3115 (Chen et al 2020) at 6.)

Response to Finding No. 761

[redacted]

762. [redacted]

Response to Finding No. 762

[redacted]

[redacted]

763. Should additional imaging be required to do so, those putative tests would likely require specialized vendors, that are not utilized in the routine workflow of the Galleri test, to provide a result to the patient. (*See* Aravanis (Illumina) Tr. 1829–30; Berry (Illumina) Tr. 814–16.)

Response to Finding No. 763

The proposed finding is vague to the extent it is unclear what "putative tests" it is referring to nor what it considers the "routine workflow of the Galleri test." The finding is unsupported as neither the testimony of Aravanis nor Berry discuss vendors needed by either the Galleri test or its rivals. Further neither Aravanis nor Berry have the foundation to testify about the workflow of non-Galleri MCEDs. As such, their unsupported, biased testimony should be disregarded in its entirety. [redacted] Therefore, this Court should disregard the proposed finding.

4. **Hypothetical Monopolist Test**

764. To show the hypothetical monopolist test is met here, Complaint Counsel relies exclusively on the testimony of Dr. Scott Morton. (CC Pretrial Br. at 47.)

Response to Finding No. 764

The proposed finding is misleading to the extent Respondents are implying that Complaint Counsel's market definition relies solely on the testimony and report of Dr. Scott Morton. Rather, as described in Complaint Counsel's post-trial briefing, Complaint Counsel relies on the extensive record in this case – including but not limited to Dr. Scott Morton's testimony – prove its alleged market. [redacted]

764.1 [redacted]

Response to Finding No. 764.1

[redacted] (*See See* PX7138 (Scott Morton Trial Dep. at 102–06, 181–82); *see generally* PX6090 (Scott Morton Expert Report).)

Response to Finding No. 764.2

[redacted]

765. Dr. Scott Morton did not conduct a SSNIP analysis based on quantitative purchase data.

Response to Finding No. 765

[redacted]

766. [redacted]

Response to Finding No. 766

[redacted]

767. In addition, Dr. Scott Morton did not attempt to fill the information gaps in her assessment using surveys or other means, including information about the preferences and likely switching behavior of clinicians, patients and payors related to the products she includes and excludes from her proposed MCED market. (RX3871 (Willig Expert Report) ¶ 21; RX6004 (Katz, Trial Dep. at 21).) She did not attempt to analyze substitution from the perspective of

payors, despite acknowledging that payor choices will drive adoption of different screening tests. (RX3871 (Willig Expert Report) ¶ 20.)

Response to Finding No. 767

The proposed finding is vague and misleading. The proposed finding is vague as it is unclear what "information gaps" it is referring to. Moreover, it is misleading to the extent it implies that [redacted] Therefore, this Court should disregard the proposed finding.

767.1 For instance, the need to obtain payor coverage of NGS-based screening tests will exert pressure on test developers to keep prices low when they commercialize their products. (*See* RX6004 (Katz, Trial Dep. at 19–20) ("[T]here's an information gap there then because we don't have the actual experience and she didn't, as far as I can tell certainly from her reports and her testimony, that she didn't attempt to fill those information gaps in by, say, doing some sort of survey of, you know, clinicians or payers to understand what they would think about, you know, various alternatives and how close they would view those to be substitutes and then try to infer from that what that would mean for their switching behavior."); [redacted]

Response to Finding No. 767.1

[redacted]

[redacted]

[redacted]

768. Dr. Scott Morton's failure to account for payor adoption in this way is compounded by her failure to assess how the possible characteristics of the MCED tests in development might impact the likelihood of switching within her defined market. [redacted]

5. **Subjective and Changing Policy Assessments**

771. Complaint Counsel seeks to dismiss the shortcomings in its proof by asserting that the relevant market is nascent and that there is limited evidence available to it. (*See* CC Pretrial Br. at 31.) It suggests that the law is specially written to protect nascent markets and that such markets are not inoculated from application of the antitrust laws. (*See* CC Pretrial Br. at 31.)

Response to Finding No. 771

The proposed finding should be disregarded because it is not a "finding of fact," but rather a legal conclusion in contravention of this Court's order and the Part 3 rules. (*See* 16 C.F.R. § 3.46; Order on Post-Trial Findings). Respondents have merely recited a portion of their own Post-Trial Brief—in effect representing their argument as a "fact." (*See* Resp.'s Post-Trial

Brief at 70-71). [redacted] Therefore, this Court should disregard the proposed finding.

772. Dr. Scott Morton has not performed the analysis necessary to define an innovation market. (RX6004 (Katz Trial Dep. at 26) ("If she had been doing an innovation market, she should have been asking a different question about the hypothetical monopolist. You would ask the question did a hypothetical monopolist that controlled some set of assets to innovation -- you know, you already think of those as easier just think of controlled a bunch of firms that were innovators -- could it find it profitable to cut back on innovation. And thinking about the boundaries of the market, you'd be focusing on capabilities to do innovation. You'd be looking at different factors. I think it's clear that Professor Scott Morton when she applies her hypothetical monopolist test is applying it to defining a product market, not an innovation market.").)

Response to Finding No. 772

The proposed finding is not supported. [redacted]

Here, Respondents fail to point to any corresponding analysis from Dr. Willig's expert report. Indeed, they cannot because Dr. Willig offered no opinion regarding the requirements for defining an innovation market or whether Dr. Scott Morton had fulfilled said requirements. (RX3871 (Willig Expert Report) ¶¶ 6-8). Given that Respondents' assertion is based solely on impermissible expert opinion testimony it should be disregarded. Moreover, Respondents' arguments fail for all the reasons stated in Complaint Counsel's Post-Trial Reply Brief.

[redacted] Therefore, this Court should disregard the proposed finding.

B. The Alleged Related Product Market

1. No Proof to Support Alleged Related Product Market

773. Complaint Counsel defines the related product market as "Illumina's NGS instruments and consumables". (CC Pretrial Br. at 49; Complaint ¶ 50 ("Illumina's NGS platform is the related product".) The narrowness of this alleged market, in which Illumina would obviously be a monopolist (as it would necessarily be the only supplier), stands in stark contrast to the very broad manner in which Complaint Counsel seeks to define the relevant product market. (*See* PFF V.A.)

Response to Finding No. 773

The proposed finding should be disregarded because it is not a "finding of fact" but a legal argument pulled directly from Respondent's post-trial brief and inappropriately mischaracterized as a fact. (*See* Respondents' Post Trial Brief at 76). Moreover, it misstates Complaint Counsel's legal arguments regarding the related product at issue. [redacted] Given its complete and utter failure to abide this Court's order and the Part 3 rules and the FOF's inaccuracy, this finding should be disregarded in its entirety. (*See* 16 C.F.R. § 3.46; Order on Post-Trial Findings).

774. In discussing the relevant product market, Complaint Counsel acknowledges that an appropriate antitrust market is dependent on reasonable interchangeability, the *Brown Shoe* practical indicia and the hypothetical monopolist test. (*See* CC Pretrial Br. at 30–48.)

Response to Finding No. 774

The proposed finding should be disregarded because it is not a "finding of fact" but a

legal argument pulled directly from Respondent's post-trial brief and inappropriately mischaracterized as a fact. (*See* Respondents' Post Trial Brief at 76). Given its complete and utter failure to abide this Court's order and the Part 3 rules, this finding should be disregarded in its entirety. (*See* 16 C.F.R. § 3.46; Order on Post-Trial Findings).

775. Neither Complaint Counsel nor its expert (Dr. Scott Morton) does the requisite analysis, despite the availability of quantitative data. Complaint Counsel says simply that MCED test developers prefer Illumina's NGS instruments and consumables to the alternatives. (FTC Pretrial Br. at 53–57; [redacted]

Response to Finding No. 775

[redacted]

[redacted]

2. Current NGS Platform Alternatives to Illumina

776. Contrary to Complaint Counsel's unproven contention, there are other viable NGS platforms on the market that can support MCED tests in development.

Response to Finding No. 776

The proposed finding should be disregarded because it is not a "finding of fact," but rather an argument in contravention of this Court's order and the Part 3 rules. (*See* 16 C.F.R. § 3.46; Order on Post-Trial Findings). Respondents have merely recited a portion of their own Post-Trial Brief—in effect representing their argument as a "fact." (*See* Respondents' Post-Trial Brief at 95). The proposed finding is "vague" because it does not define what "viable NGS platforms" or "that can support MCED tests in development" means. This proposed finding is also unsupported, citing no evidence, and should be disregarded. [redacted]

777. BGI. BGI already has a commercially available NGS platform, markets its NGS technology in many other countries and is expected to enter the U.S. market in the near future. [redacted]

Response to Finding No. 777

[redacted]

[redacted]

[redacted]

777.1 BGI is currently enjoined from launching its sequencing instruments and related reagents in the United States due to its infringement of a certain Illumina patents that expire in 2022 and 2023. (RX3356 (Businesswire); RX3869 (Cote Expert Report) ¶ 287.)

Response to Finding No. 777.1

Complaint Counsel objects to this proposed finding as incomplete, improper expert opinion, and unreliable.

Although Complaint Counsel does not disagree with the fact that "BGI is currently enjoined from launching its sequencing instruments and related reagents in the United States," this proposed finding is incomplete in that it suggests Illumina is seeking injunctive relief against BGI based only on patents that expire in 2022 and 2023. [redacted] Furthermore, the Business Wire article cited to support this proposed finding is dated June 16, 2020. More recently in February 2021, Illumina's executive Dr. Aravanis represented to investors that that Illumina has alleged that BGI infringed patents that expire after 2023, ranging from 2024 to 2027 and hinted at future patent lawsuits noting that "[a]s we learn more about BGI's products, additional patents may become relevant." (PX2822 (Illumina) at 006-007 (Baird Non-Deal Roadshow with Alex Aravanis, Feb. 19, 2021; *see also* deSouza (Illumina) Tr. 2231).

Respondents also cite their expert, Dr. Cote, inappropriately to support a factual proposition. This Court held that experts shall not be cited to "support factual propositions that

should be established by fact witnesses or documents." (*See* Order on Post-Trial Findings at 3). Accordingly, this Court should disregard this evidence. Lastly, to the extent Respondents are claiming that it is Dr. Cote's expert opinion that Illumina's patents are preventing BGI's entry into the U.S. market until 2023, Dr. Cote has no basis to testify about Illumina's patent position. [redacted] For this reason, any expert opinion offered by Dr. Cote regarding BGI's future freedom to operate in the United States is not only improper expert opinion but also completely lacks foundation. [redacted] Therefore, with the exception of the specific language with which Complaint Counsel does not disagree, this Court should disregard the proposed finding.

> 777.2 BGI may enter the U.S. market by August 2022. *Illumina, Inc. v. BGI Genomics, Co.*, 20-cv-01465-WHO (N.D. Cal. Mar. 27, 2022), ECF No. 665 at 48 ("If [BGI] make[s] offers to sell Accused Products in the U.S. before the expiration of the patents-in-suit—as they are permitted—they must include the following conspicuous written disclaimer: 'No sales will occur, and no purchase orders will be accepted, until after August 23, 2022.'")

Response to Finding No. 777.2

The proposed finding is unsupported in that the court order cited does not provide that "BGI may enter the U.S. market by August 2022." The court order *bars* BGI from entering until after August 23, 2022, but it in no way purports to authorize or permit BGI to "enter the U.S. market" as of that date, nor could it. The federal court in the Northern District of California ruled solely on the case or controversy before it, which involved the limited set of U.S. patents Illumina chose to assert *in that lawsuit only*. The court determined nothing whatsoever regarding other patents, lawsuits, or other legal obstacles that may well block BGI from entering the U.S. market long after August 23, 2022.

The proposed finding is incomplete and misleading in that it suggests Illumina is only seeking injunctive relief against BGI through the suit captioned *Illumina, Inc. v. BGI Genomics, Co.*, 20-cv-01465-WHO (N.D. Cal.), in federal court in the Northern District of California. [redacted]

Moreover, Illumina holds additional patents touching "every aspect of the sequencing workflow, including nucleotides, enzymes, reagent mixes, instruments, optics, analysis software, and bioinformatics, which result from Illumina's significant investments in research and development" that extend to beyond 2030 and which "may become relevant" against BGI. (deSouza (Illumina) Tr. 2231-2232; PX2822 (Illumina) at 006-007 (Baird Non-Deal Roadshow with Alex Aravanis, Feb. 19, 2021)). Therefore, this Court should disregard the proposed finding.

To the extent this proposed finding purports to suggest that BGI intends to launch its NGS platform in the U.S. in 2022 notwithstanding Illumina's pending patent infringement suit, Respondents have no evidence to support that claim. Respondents elected not to pursue any form of discovery from BGI in this action. Therefore, this Court should disregard the proposed finding.

[redacted]

[redacted]

779. Oxford Nanopore. In addition to BGI and Thermo Fisher, Oxford Nanopore is also a viable alternative for MCED developers. (RX3521 (NCM) at 50–51; RX3167 (ONT); RX3520 (NCM) at 6, 9–10; RX3869 (Cote Expert Report) ¶ 268.)

Response to Finding No. 779

[redacted]

[redacted]

[redacted]

779.1 ONT's recent improvements, such as adaptations to its sequencers and library preparation, has made its platform more suitable for multi-cancer screening. (*See* RX3441 (Marcozzi et al., 2020); RX3446 (Martignano et al., 2021); RX3869 (Cote Expert Report) ¶¶ 293, 295–98.)

Response to Finding No. 779.1

This proposed finding is vague, confusing, unsupported, misleading, and relies on hearsay evidence, improper expert testimony, and is against the weight of the evidence.

The proposed finding is vague and confusing because it does not describe what is meant by "recent improvements" or "adaptations to its sequencers and library prep" or why these changes purportedly make ONT's NGS platform more suitable for MCED test developers than prior to those changes. Furthermore, Respondents cite two academic journal articles to support this proposed finding. To the extent Respondents are citing these articles to support the factual proposition that ONT's has, in fact, made changes to its sequencers and library prep that would make these platforms more suitable for MCED test developers that is an out of court statement being offered for the truth of the matter asserted and hearsay evidence. As such, the Court ought not give this evidence any weight. Respondents did not obtain any documents or testimony from ONT through discovery and therefore cannot point to any evidence directly from ONT about any adaptions ONT has made to its platform, or how those adaptations might change the commercial applications of ONT's long-read NGS platform.

[redacted]

[redacted]

Respondents yet again rely upon their own unreliable expert Dr. Cote. Dr. Cote's is not qualified to provide expert opinion testimony about which NGS platforms are viable for MCED testing, because he has never operated an NGS instrument and has no publications related to NGS, among other reasons. (*See* Response to RPFF ¶ 1964, below (examining Dr. Cote's lack of qualifications on subject of which NGS platforms are viable for MCED testing)). This Court should not accord Dr. Cote's opinion any weight. [redacted] Furthermore, this Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (*See* Order on Post-Trial Findings at 3). To the extent Respondents are attempting to use Dr. Cote's report to support any factual proposition about ONT's NGS platform's capabilities or improvements, that is improper and the Court should disregard that evidence.

Given Respondents' reliance on unreliable, improper expert testimony and hearsay, this Court should disregard this finding.

> 779.2 ONT's instruments reportedly will compete with Illumina's on throughput, accuracy and cost. ONT's highest throughput instrument, the PromethION, has a higher throughput than the highest performance instrument and flow cell currently offered by Illumina, the NovaSeq 6000 with the S4 flow cell. (RX3543 (ONT); RX1205 (Illumina); RX3869 (Cote Expert Report) ¶ 294.)

Response to Finding No. 779.2

[redacted]

[redacted]

[redacted]

779.3 ONT's claims its instruments have similar accuracy to Illumina. (*Compare* RX3541 (ONT) at 1; RX3535 (ONT) at 1 *with* RX3368 (Illumina).) And, as shown in the table below, ONT may offer per Gb sequencing costs that are lower than what Illumina offers.

789. Complaint Counsel bases its alleged market definition on speculation about future entry by early-stage developmental MCED tests (*see* Section I.A above), while simultaneously

discarding evidence of actual competition and future entry by NGS developers in defining the alleged related product market. (*See* RX6000 (Carlton Trial Dep. at 37–38) ("[A]ll I can do is point out the asymmetry in [Complaint Counsel's] analysis . . . in which [it] assumes that the MCED products are going to come into existence, but the NGS alternatives to Illumina are not.")

Response to Finding No. 789

The proposed finding should be disregarded because it is not a "finding of fact," but rather a legal conclusion and an argument in contravention of this Court's order and the Part 3 rules. (*See* 16 C.F.R. § 3.46; Order on Post-Trial Findings). Respondents have merely recited a portion of their own Post-Trial Brief—in effect representing their argument as a "fact." (*See* Resp.'s Post-Trial Brief at 82-83).

4. Adapting Assays Developed on Illumina's Platforms to Another Platform

790. [redacted]

Response to Finding No. 790

[redacted]

[redacted]

791. It is likely that a test developer will need to switch between different sequencing platforms (such as between different Illumina NGS platforms) during the course of developing a screening test, even absent the acquisition. (Cote Tr. 3739, 3771; Aravanis (Illumina) Tr. 1865.)

Response to Finding No. 791

Complaint Counsel objects to the proposed finding because it cites only unreliable and unfounded self-serving testimony, against the weight of the evidence, and it improperly cites expert testimony.

Dr. Cote is not a credible witness, so his opinion does not deserve any weight. Dr. Cote offered opinion testimony in this matter that spans multiple disparate subjects and exceeds his expertise; his trial testimony also contained unsupported claims about his experience related to MCED test development that exceed the information disclosed in his report in violation of this Court's order; and his previous prediction of upstream entry was wrong casting doubt on similar analysis in this case. (*See* Response to RPFF ¶ 1959, below, (setting forth Dr. Cote's credibility problems across these subjects)). Dr. Cote is not qualified to provide expert opinion testimony about the process and timeline for developing a multicancer screening test because he has no experience developing such tests. (*See* Response to RPFF ¶ 1960, below, (examining Dr. Cote's lack of qualifications on subject of MCED development process and timeline)). Dr. Cote is not qualified to provide expert opinion testimony about which NGS platforms are viable for MCED

testing because he has never operated an NGS instrument and has no publications related to NGS, among other reasons. (*See* Response to RPFF ¶ 1964, below, (examining Dr. Cote's lack of qualifications on subject of which NGS platforms are viable for MCED testing)). With no expertise developing multicancer tests nor operating NGS equipment he has no basis to offer an opinion on the likelihood, process, or difficulty of switching NGS platforms for MCED test developers. In addition to Dr. Cote being unqualified and not credible, his opinion about any test developer switching platforms is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community. This Court should not accord Dr. Cote's opinion any weight.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Cote for support for the purported facts in the proposed finding in contravention of this Court's Order. Dr. Cote has no personal knowledge or experience regarding switching an MCED test from one NGS platform to another (or developing an MCED test on any platform). This Court should disregard this evidence.

Dr. Aravanis's testimony that Respondents rely upon for this proposed finding is unfounded, and contrary to the weight of the evidence. First, Complaint Counsel objects to Illumina's Chief Technology Officer Dr. Aravanis's testimony about the difficulty, length of time, and cost associated with any MCED test developer switching from one NGS platform to another as lacking foundation. The testimony that Respondents cite to is Dr. Aravanis speculating about what it would take for Grail to switch between different models of Illumina sequencers. As Grail never did so, and Dr. Aravanis is currently an Illumina executive, Dr.

Aravanis has no basis upon which to speculate about the length of time and process involved if Grail were to switch NGS sequencers. He has absolutely no basis to opine on any other MCED test developer's ability to switch NGS platforms including the length of time it would take and the difficulty. He admitted he has no access to confidential and proprietary information including technical requirements for NGS sequencing, or the specifications of the multicancer assay for any MCED test developer, including Guardant, , Freenome, Exact, Helio, and Singlera (Aravanis (Illumina) Tr. 1975).

Illumina, Grail, and other NGS market participants recognize high switching costs. (*See* CCFF ¶¶ 1840-71). Switching NGS platforms is even more difficult once the MCED test has begun the FDA approval process. (*See* CCFF ¶¶ 1872-1901).

791.1 Test developers routinely re-validate their tests to account for new developments in their tests, new and improved technology relating to consumables or sequencers, or for any number of other reasons. (RX3869 (Cote Expert Report) ¶ 338.) These revalidations are integral to a sound business plan for any test developer. (RX3869 (Cote Expert Report) ¶ 338.)

VI. COMPLAINT COUNSEL FAILED TO PROVE THE TRANSACTION IS LIKELY TO SUBSTANTIALLY LESSEN COMPETITION

A. Vertical Mergers

797. Vertical mergers do not raise the same concerns as horizontal mergers because they do not involve the combination of substitutable products and the reduction of competition between those products. (RX6000 (Carlton Trial Dep. at 16).)

Response to Finding No. 797

The proposed finding should be disregarded because it is not a "finding of fact," but rather a legal conclusion in contravention of this Court's order and the Part 3 rules. (*See* Rule 3.46; Order on Post-Trial Findings). Additionally, the proposed finding is conclusory, and misstates the record to the extent that the cited testimony contains no mention of substitutable products or a reduction in competition between products. Moreover, the proposed finding is contrary to established economic and legal literature which demonstrates the significant anticompetitive effects which can result from vertical mergers. (*See generally* CCCL ¶¶ 11-12; 39-42; 47-51). Finally, the proposed finding is incorrect and misleading to the extent it suggests that Illumina's acquisition of Grail cannot be anticompetitive because it is vertical in nature. The weight of the evidence demonstrates the competitive harm that is likely to result from the proposed acquisition. (*See generally* CCFF ¶¶ 2607-4164; CCCL ¶¶ 39-60). Therefore, this Court should disregard the proposed finding.

798. Vertical mergers can harm competition only in narrow circumstances. (RX3864 (Carlton Expert Report) ¶ 43; RX6000 (Carlton Trial Dep. at 15–24.)

Response to Finding No. 798

The proposed finding should be disregarded because it is not a "finding of fact," but rather a legal conclusion in contravention of this Court's order and the Part 3 rules. (*See* Rule 3.46; Order on Post-Trial Findings). The proposed finding is also vague to the extent that "narrow circumstances" is undefined, and incorrect and misleading to the extent that the finding

suggests that vertical mergers cannot produce anticompetitive effects. The proposed finding is contrary to established economic and legal literature which demonstrates the significant anticompetitive effects which can result from vertical mergers. (*See generally* CCCL ¶¶ 11-12; 39-42; 47-51). The proposed finding is incorrect and contrary to the weight of the evidence to the extent it suggests that the proposed acquisition is not anticompetitive because it will not result in raising rivals' costs (the "narrow circumstances" acknowledged by Respondents' expert, Dr. Carlton). The weight of the evidence demonstrates that, post-deal, Illumina would have both the ability and incentive to foreclose or reduce the competitiveness of Grail's MCED test rivals by virtue of its ownership of irreplaceable NGS technology. (*See* CCFF ¶¶ 2607-4164). Finally, the proposed finding is incorrect and misleading to the extent it suggests that Illumina's acquisition of Grail cannot be anticompetitive because it is vertical in nature. The weight of the evidence demonstrates the competitive harm that is likely to result from the proposed acquisition. (*See generally* CCFF ¶¶ 2607-4164; CCCL ¶¶ 39-60)). Therefore, this Court should disregard the proposed finding.

799. A vertical merger involves combining firms that have complementary assets. (RX3864 (Carlton Expert Report) ¶¶ 42, 54; RX6000 (Carlton Trial Dep. at 16:7–24; 17:7–24.)

Response to Finding No. 799

[redacted]

[redacted]

800. Most vertical mergers are likely to generate significant efficiencies for reasons that are well understood in the literature. (RX3864 (Carlton Expert Report) ¶¶ 42, 52; RX6000 (Carlton Trial Dep. at 15–18.)

Response to Finding No. 800

[redacted]

[redacted]

800.1 It is well known that when two firms with complementary assets combine, it can eliminate transaction costs that enable procompetitive collaboration that would not be achieved by the firms in an arm's-length relationship. (RX6000 (Carlton Trial Dep. at 16.)

Response to Finding No. 800.1

[redacted]

[redacted]

800.2 The efficiency benefits from vertical integration can provide a powerful motivation for a vertical merger and can eliminate any concerns about potential adverse competitive impacts since efficient mergers lead to lower prices and/or improvements in the quality or availability of products, all of which benefit consumers. (RX3864 (Carlton Expert Report) ¶ 42; RX6000 (Carlton Trial Dep. at 16.)

Response to Finding No. 800.2

[redacted]

[redacted]

800.3 As Commissioner Wilson as noted, "[e]conomists have conducted a number of retrospective studies of vertical mergers. Most suggest that consumers benefit. For example, LaFontaine and Slade found in a 2007 survey that 'efficiency considerations overwhelm anticompetitive motives in most contexts.' A 2005 survey by four FTC economists found similar results. So did a 2018 survey by economists at the Global Antitrust Institute." (RX4008 (Wilson).)

Response to Finding No. 800.3

[redacted]

800.4 A single firm able to coordinate how these assets are used may be able to streamline production, inventory management or distribution. (RX3701 (FTC) at 13; RX3864 (Carlton Expert Report) ¶ 54; RX6000 (Carlton Trial Dep. at 17–18, 57.)

Response to Finding No. 800.4

[redacted]

800.5 It may also be able to create innovative products in ways that would not likely be achieved through arm's-length contracts. (RX3701 (FTC) at 13; RX3864 (Carlton Expert Report) ¶ 54; RX6000 (Carlton Trial Dep. at 17–18, 57.)

Response to Finding No. 800.5

[redacted]

[redacted]

800.6 Such efficiencies are particularly important in industries that are characterized by high levels of R&D expenditures and where firms are unwilling to share their valuable, proprietary knowledge with others, absent a merger. (RX3864 (Carlton Expert Report) ¶ 54; RX6000 (Carlton Trial Dep. at 57.)

Response to Finding No. 800.6

[redacted]

[redacted]

800.7 Efficiencies that bring products to market more quickly and facilitate more productive R&D efforts benefit consumers directly. (RX3864 (Carlton Expert Report) ¶ 54; RX6000 (Carlton Trial Dep. at 17–18, 57.)

Response to Finding No. 800.7

[redacted]

[redacted]

[redacted]

801. An analysis of a vertical merger that ignores evidence of merger-specific efficiencies is incomplete and likely to arrive at an unsupportable conclusion. (RX3864 (Carlton Expert Report) ¶ 54.)

Response to Finding No. 801

[redacted]

801.1 [redacted]

Response to Finding No. 801.1

[redacted]

[redacted]

B. Importance of a Full Economic Model

802. A complete analysis of a vertical merger requires an economic model that accurately reflects the upstream and downstream markets in which the merging firms operate. (RX3864 (Carlton Expert Report) ¶¶ 51–55; RX6000 (Carlton Trial Dep. at 24:6–25:10.)

Response to Finding No. 802

[redacted]

[redacted]

803. A full economic model must simultaneously accounts for the change in incentives to price to downstream rivals (bearing in mind the impact of post-merger contractual and reputational constraints) as well as any efficiencies, while taking into consideration any constraints on the firms' behavior. (RX3864 (Carlton Expert Report) ¶¶ 51–55; RX6000 (Carlton Trial Dep. at 24–25.)

Response to Finding No. 803

[redacted]

[redacted]

803.1 As Dr. Carlton testified "[i]f you don't take account of the efficiencies or, more broadly, the incentive to lower price, you risk preventing a merger that would bring large benefits to society because you've failed to balance the benefits against the possible harms." (RX6000 (Carlton Trial Dep. at 26).)

Response to Finding No. 803.1

[redacted]

804. The outcome of a vertical model is influenced by a number of factors, including (i) the efficiencies arising from the merger, (ii) the incentives on the merged firm that can exert downward pricing pressure, (iii) the merged firms' profit margins, (iv) the demand curves of each of the merging firms, (v) the diversion ratios of the downstream product (that is, the share of downstream rivals' sales that would divert to the merged firm in response to an upstream price increase), (vi) the competitive forces facing the upstream firm, (vii) the cost of the upstream inputs relative to downstream revenues and margins, (viii) downstream product differentiation, and (ix) any reputational and contractual constraints on the merged firm. (RX3864 (Carlton Expert Report) ¶¶ 44–50; RX6000 (Carlton Trial Dep. at 24.)

Response to Finding No. 804

[redacted]

[redacted]

804.1 [redacted]

Response to Finding No. 804.1

[redacted]

805. The economic model must also take account of the "timing and magnitude of potential harm versus likely benefit" because "if the harms are far off in the future, but the benefits are closer in", that critical balance of potential harms versus benefits would be skewed and a procompetitive vertical merger could, as a result, be disallowed, depriving consumers of enormous benefits. (RX6000 (Carlton Trial Dep. at 25–26).)

Response to Finding No. 805

[redacted]

[redacted]

806. Only with such a model could one make a judgment as to whether the merger would likely result in net harm to consumers. (RX3864 (Carlton Expert Report) ¶ 55; RX6000 (Carlton Trial Dep. at 24–25).)

Response to Finding No. 806

[redacted]

[redacted]

807. If an economic model fails to reflect the efficiency benefits of a vertical merger and balance those effects against the possible harms, it creates the risk of preventing a merger that would bring large benefits to society. (RX6000 (Carlton Trial Dep. at 25 –26).)

Response to Finding No. 807

[redacted]

C. Complaint Counsel Failed to Present a Full Economic Model Supporting the Alleged Harms

808. [redacted]

Response to Finding No. 808

[redacted]

[redacted]

809. [redacted]

Response to Finding No. 809

[redacted]

[redacted]

810. [redacted]

Response to Finding No. 810

[redacted]

811. Complaint Counsel and Dr. Scott Morton offer no model that properly accounts for the costs and benefits associated with the transaction, including massive merger-specific efficiencies; properly credits the impact of contractual and reputational constraints on Illumina's post-merger behavior; and properly accounts for the ability of MCED test providers to take steps to reduce their reliance on Illumina. (RX3864 (Carlton Expert Report) ¶ 55.)

Response to Finding No. 811

[redacted]

[redacted]

[redacted]

812. [redacted]

Response to Finding No. 812

[redacted]

[redacted]

813. Complaint Counsel and Dr. Scott Morton have posited a future downstream market, but it fails to specify what that market will look like, what firms will compete in that market, and what will be the characteristics of the rivals' products. (RX3864 (Carlton Expert Report) ¶ 87.)

Response to Finding No. 813

[redacted]

814. Such facts are necessary in order to model the effect of any incentive to raise rivals' costs, but they are absent from Dr. Scott' Morton's analysis. (RX3864 (Carlton Expert Report) ¶ 87.)

Response to Finding No. 814

[redacted]

[redacted]

D. Complaint Counsel and Dr. Scott Morton Fail to Account for Illumina's Pre-Merger Stake in GRAIL and Make Unwarranted Assumptions in Describing the Alleged Changes in Illumina's Incentives

815. In an analysis of a vertical merger, it is important to compare the premerger world to the post-merger world to understand the impact of the merger on the merging parties' incentives. (RX6000 (Carlton Trial Dep. at 92–94).)

Response to Finding No. 815

[redacted]

816. Absent the Transaction, Illumina would have a 12% stake in GRAIL's profits and would receive 7% of GRAIL's net revenues on every sale. (PFF ¶ 50.)

Response to Finding No. 816

[redacted]

[redacted]

817. The royalty is a unique feature of GRAIL's contract with Illumina, reflecting Illumina's contributions to the formation of GRAIL—Illumina has no comparable arrangement with any other test developer purportedly developing an MCED test. (deSouza (Illumina) Tr. 2463–64; PX7107 (deSouza (Illumina) Dep. at 191); Strom (Morgan Stanley) Tr. 3543–44; RX6000 (Carlton Trial Dep. at 92–94).)

Response to Finding No. 817

The proposed finding is vague and misleading. It is unclear what "contributions to the formation of Grail" Respondents are referring to or what a "comparable arrangement" means. It is misleading because Illumina does offer a comparable arrangement for any company that signs the Open Offer. The standardized IVD partnership agreement in the Open Offer requires, for IVD rights to all platforms, a tech access fee of $25 million, development milestone payments of $1 million to $5 million per IVD test kit, and a revenue sharing royalty of six percent. (PX0087 at 021, 041 (Illumina IVD Test Kit Agreement – All Platforms, dated Mar. 30, 2021)). Therefore, this Court should disregard the proposed finding.

818. In light of the pre-merger royalty and equity stake, under Complaint Counsel's own theory of Illumina's incentives, Illumina "makes much more money if a customer uses the GRAIL test than if it uses that of" a GRAIL rival, which means "there already is an incentive to favor GRAIL" and "therefore, the merger" has no effect on Illumina's dealings with GRAIL rivals. (RX6000 (Carlton Trial Dep. at 93–94).)

Response to Finding No. 818

[redacted]

[redacted]

[redacted]

819. [redacted]

Response to Finding No. 819

[redacted]

[redacted]

820. Dr. Scott Morton purports to quantify Illumina's incentives before and after the transaction, but her only attempt at quantifying those incentives makes unwarranted assumptions and carries no weight:

Response to Finding No. 820

The proposed finding is conclusory, unsupported, incomplete, and inconsistent with the evidentiary record, which demonstrates that Dr. Scott Morton applied sound economic reasoning in her analysis of Illumina's changed incentives post-deal. The proposed finding cites no evidence to support its contention and should be disregarded for that reason alone. The proposed finding is vague and misleading to the extent it refers to unspecified "unwarranted assumptions," and to the extent it refers to Dr. Scott Morton's "only attempt" to quantify Illumina's incentives. Therefore, this Court should disregard the proposed finding.

Response to Finding No. 820.1

[redacted]

[redacted]

820.2 [redacted]

Response to Finding No. 820.2

[redacted]

820.3 [redacted]

Response to Finding No. 820.3

[redacted]

[redacted]

820.4 [redacted]

Response to Finding No. 820.4

[redacted]

[redacted]

820.5 [redacted]

Response to Finding No. 820.5

[redacted]

[redacted]

821. There is no basis for Professor Scott Morton's assumption that any rival MCED test developer would pay a royalty similar to GRAIL, and the assumption ignores the unique nature of the GRAIL royalty and the undisputed fact that no other supply agreement contains such a provision. (RX6000 (Carlton Trial Dep. at 92–94).)

Response to Finding No. 821

The proposed finding is incorrect. There is a basis for Dr. Scott Morton's assumption that rival MCED test developers would pay a royalty similar to Grail. Among other sources of evidence, Dr. Scott Morton relied on the standardized IVD partnership agreement in the Open Offer, which requires, for IVD rights to all platforms, a tech access fee of $25 million, development milestone payments of $1 million to $5 million per IVD test kit, and a revenue sharing royalty of six percent. (PX0087 at 021, 041 (Illumina IVD Test Kit Agreement – All Platforms, dated Mar. 30, 2021)). Moreover, Dr. Gao of Singlera testified that Illumina sent Singlera a draft IVD rights term sheet, which included a $40 per sample "Market Access Fee" (in

addition to other fees and a 10 percent revenue share). (PX7042 (Gao (Singlera) IHT at 78-80); *see* PX8516 (Singlera) at 006 (Singlera, Email attaching Singlera-Illumina Draft IVD NextSeqDX Term Sheet, June 20, 2020)). Therefore, this Court should disregard the proposed finding.

822. Correcting for the erroneous assumption that any rival MCED test developer would pay a royalty similar to GRAIL, the result of her analysis shows that there is an incentive to favor GRAIL in the world without the merger because Illumina makes much more money if a customer uses the GRAIL test than if it uses that of the hypothetical rivals in Professor Scott Morton's quantification analysis. That means, if Professor Scott Morton were right about Illumina having a post-merger incentive to favor GRAIL, it would have that incentive even without the merger. (RX6000 (Carlton Trial Dep. at 92–94); RX3864 (Carlton Expert Report) at ¶ 148, Table 4.)

Response to Finding No. 822

[redacted]

[redacted]

[redacted]

[redacted]

822.1 The table below shows the results of Dr. Scott Morton's quantification after correcting for her erroneous assumption:

[redacted]

(RX3864 (Carlton Expert Report) ¶ 148, Table 4.)

Response to Finding No. 822.1

[redacted]

[redacted]

[redacted]

822.2 The first row of Table 4 replicates the conclusions from Scott Morton Table 2. According to this hypothetical, pre-merger, Illumina makes similar profits from selling to GRAIL and selling to GRAIL's hypothetical rivals. The second row corrects the error on royalty rates; and the third row additionally corrects the error of relying on 2023 data. The third row demonstrates that, even pre-merger, Illumina makes approximately five times as much from selling a unit through GRAIL rather than through GRAIL's rivals. Therefore, any incentive to foreclose, by Dr. Scott Morton's reasoning, currently exists. (RX3864 (Carlton Expert Report) ¶ 149.)

Response to Finding No. 822.2

[redacted]

[redacted]

[redacted]

822.3 As Dr. Carlton put it: "if you believed those assumptions -- which I do not -- but if you correct for the fact that she has improperly excluded royalties from rival one and rival two, you find that in her -- with her assumptions, there already is an incentive to deal with GRAIL and not deal with the rivals, and, therefore, the merger would do nothing." (RX6000 (Carlton Trial Dep. at 92–94).)

Response to Finding No. 822.3

[redacted]

[redacted]

[redacted]

E. There is No Basis to Predict That Foreclosure Would Cause Material Diversion From Future MCED Tests to GRAIL

1. Diversion is a Necessary Condition for Foreclosure

823. Significant diversion is a necessary condition for a vertical merger to give rise to foreclosure incentives because, as a matter of basic economics, "if there's no diversion, then there's no incentive to engage in [a foreclosure] strategy because the vertically integrated firm would just lose sales" and therefore "you need significant diversion for the strategy to make sense." (RX6000 (Carlton Trial Dep. at 21–22).)

Response to Finding No. 823

The proposed finding is vague, incomplete, misleading, and conclusory. It is vague because the term "significant diversion" is not defined. There is no way to tell from the proposed finding or the source, Dr. Carlton's trial deposition testimony, how much diversion Dr. Carlton deems necessary to give rise to foreclosure incentives. The finding is incomplete because it does not describe any other factors besides diversion that factor into whether a vertical merger will create foreclosure incentives. It is conclusory because it provides no rationale for Dr. Carlton's contention other than to point out that "if there's no diversion, then there's no incentive to engage in [a foreclosure] strategy…" And it is misleading insofar as it suggests that Dr. Carlton has been able to conclude that there will not be "significant diversion" between Galleri and other MCED tests. Dr. Carlton testified only that he believes it is "unclear" whether Grail and other MCED tests will have high diversion ratios. (RX6000 (Carlton Trial Depo.) at

26-27). [redacted]

[redacted] Therefore, this Court should disregard the proposed finding.

824. [redacted]

Response to Finding No. 824

[redacted]

2. Relevance of Product Differentiation

825. Downstream harm from a raising-rivals-costs strategy can only occur if the downstream rivals' products are not too differentiated and, even then, only under specific circumstances. (RX3864 (Carlton Expert Report) ¶ 50.)

Response to Finding No. 825

The proposed finding is vague. [redacted] Therefore, this Court should disregard the proposed finding.

826. Dr. Carlton explained that "if products are very different from one another, it suggests that they're unlikely to be close substitutes, and if they're not close substitutes, then the diversion of sales from the rival -- to in this case GRAIL . . . [is] likely to be low or nonexistent", and "if it's low or nonexistent, then the incentive -- the profit incentive to engage in the raising rivals' cost strategy . . . will also be low or nonexistent". (RX6000 (Carlton Trial Dep. at 40–41); RX3864 (Carlton Expert Report) ¶ 50).)

Response to Finding No. 826

The proposed finding is vague and misleading. [redacted]

[redacted]

827. Illumina's incentive to raise rivals' costs is diminished the greater the downstream tests are different from each other, because the greater the differentiation is between GRAIL and its rivals, the less diversion would be expected to GRAIL if Illumina attempted to raise rivals' costs. (RX3697 (Carlton 2019) at 7–9; RX3864 (Carlton Expert Report) ¶ 87.)

Response to Finding No. 827

The proposed finding is incomplete and misleading insofar as it suggests that Illumina lacks the incentive to raise rivals' costs. [redacted]

[redacted]

828. [redacted]

Response to Finding No. 828

[redacted]

829. [redacted]

Response to Finding No. 829

[redacted]

[redacted]

3. **No Possibility of Current Diversion**

830. Galleri is the only NGS-based MCED test on the market. (*Supra* PFF ¶ 698.)

Response to Finding No. 830

[redacted]

[redacted]

[redacted]

[redacted]

831. Because Galleri is the only NGS-based MCED test on the market, there could be no sales from Galleri rivals to divert today – current diversion is impossible. (RX6000 (Carlton Trial Dep. at 46).)

Response to Finding No. 831

[redacted]

[redacted]

4. **No Basis To Predict Future Diversion Given Differentiation Of Galleri And Other Tests In Development**

832. There also is substantial uncertainty around the MCED tests in development. (*Supra* PFF ¶¶ 701–706).)

Response to Finding No. 832

[redacted]

[redacted]

[redacted]

833. There is no way to exactly know what the MCED tests-in-development will look like, if and when they are launched. (*Supra* PFF ¶¶ 680.1–680.5.)

Response to Finding No. 833

[redacted]

[redacted]

[redacted]

834. It is unfounded speculation to say that any MCED tests-in-development would include, at any point in the foreseeable future, features that could make them reasonably close substitutes for GRAIL's Galleri test. (*Supra* PFF ¶¶ 680.1–680.5.)

Response to Finding No. 834

[redacted]

[redacted]

[redacted]

[redacted]

835. Most of the MCED test developers cited by Complaint Counsel are planning to launch tests as single-cancer tests, with additional plans to incrementally add additional cancers to their tests at some point in the future. (*Supra* PFF ¶¶ 701–705.)

Response to Finding No. 835

[redacted]

836. None of the MCED test developers cited by Complaint Counsel have ascertained the specific features of any MCED test that they may launch in the future, although it is clear that none are on a path to launching a test, like Galleri, that can detect 50 cancer types and cancer of origin in a single blood draw:

Response to Finding No. 836

[redacted]

Moreover, the proposed finding is incomplete and misleading. There is no clinical evidence that Galleri can provide early detection of 50+ cancers in an asymptomatic population. Nor is there clinical evidence that Galleri can provide early detection of 20 cancers in an asymptomatic population, or ten, or even eight. As of trial, Galleri had been clinically shown to detect only seven types of early-stage cancer in an asymptomatic screening population – a fact conceded by Respondents' own expert. ((Cote Tr. 4000-4001) ("Q. So as of today, Galleri has been clinically shown to detect seven types of stage one through three cancer in an asymptomatic screening population, correct? A. That's correct."); [redacted]

Respondents seek to conflate the detection of cancer signals among previously diagnosed cancer patients (including many with Stage IV cancer) with the clinically relevant issue of an MCED test's capability to identify early-stage cancers in an asymptomatic screening population. Galleri is being developed (1) as a multi-cancer *early* detection test (2) for use in screening an asymptomatic population. [redacted] The fact that Galleri can detect

signals for certain cancers once those cancers reach Stage IV does not support Galleri's ability to detect those cancers early. [redacted] Respondents' own expert conceded that Stage IV cancer "is almost always incurable and will eventually result in the death of the patient." (RX3869 (Cote Rebuttal Report) ¶ 31). Likewise, the fact that Galleri can detect signals for certain cancers among individuals who have already been diagnosed with cancer does not support Galleri's ability to detect those cancers in an asymptomatic screening population.

Grail has released results from two clinical studies of Galleri: the CCGA study and the PATHFINDER study. (Aravanis (Illumina) Tr. 1891-92; Cote, Tr. 3993). The CCGA study did not involve a real-world population but rather was a case-control study that assessed Galleri's ability to detect cancer signals in individuals who had already been diagnosed with cancer. [redacted] Grail's Chief Medical Officer, Dr. Ofman, conceded at trial that the CCGA study did not involve the intended use population for Galleri. (Ofman (Grail) Tr. 3294-95). The authors of the CCGA-3 sub-study – which Respondents rely upon for their 50-cancer claims – make this point explicitly in their article, cautioning that "CCGA is a case-control study, and as such, is not reflective of performance in a screening population." (RX3409 at 010 (E.A. Klein, et al., Clinical Validation of a Targeted Methylation-Based Multi-Cancer Early Detection Test Using an Independent Validation Set, 9 Annals of Oncology 1167 (2021)). The authors of the CCGA-2 sub-study provide the same caveat about CCGA, stating: "to understand [Galleri's] performance in an asymptomatic screening population will require additional studies" beyond CCGA. (RX3430 at 10 (M.C. Liu, et al., Sensitive and Specific Multi-Cancer Detection and Localization Using Methylation Signatures in Cell-Free DNA, 6 Annals of Oncology 745 (2020)). The only other study of Galleri for which interim results have been released, PATHFINDER, likewise fails to support the notion that Galleri can provide early detection of

50+ cancers in an asymptomatic population. Grail's Chief Medical Officer, Dr. Ofman, acknowledged the challenges associated with generating the clinical evidence necessary to actually support a 50-cancer early screening claim when he admitted: "To find all 50 cancer types in a real-world population would require hundreds of thousands of people, and PATHFINDER was not designed to do that." (RPFF ¶ 398.4 (quoting Ofman (Grail) Tr. 3298). Based on the PATHFINDER study, the Galleri test has been shown to detect seven types of Stage I-III cancer in an asymptomatic screening population. (Cote Tr. 4000-01; RX3041 at 005 (Tomasz Beer, Interim Results of Pathfinder, a Clinical Use Study Using a Methylation-Based Multi-Cancer Early Detection Test, June 4, 2021). Therefore, this Court should disregard the proposed finding.

[redacted]

837. Given the vast differences between those tests and Galleri, it is clear that they will be too dissimilar to permit a foreclosure strategy to divert material sales to Illumina from GRAIL rivals at any point in the foreseeable future. (*Supra* PFF ¶¶ 825–829.)

Response to Finding No. 837

[redacted]

838. A test that detects only colon cancer, or only lung and liver cancer, is not substitutable for a test that screens for more than 50 cancer types. (*Supra* PFF ¶ 687.)

Response to Finding No. 838

[redacted]

[redacted]

[redacted]

[redacted]

839. Number of cancers detected. Galleri differs from the MCED tests-in-development based on the numbers of cancers that can be detected.

Response to Finding No. 839

The proposed finding is unsupported by any evidence and should be disregarded. It is also misleading to the extent that it suggests that Galleri is able to screen for over 50 cancers. As explained in the Response to [redacted] below, Galleri has only been shown to screen for seven cancers in an asymptomatic population, whereas CancerSEEK, from Exact/Thrive, has been shown to screen for eight cancers in an asymptomatic population. [redacted] Therefore, the finding is misleading to the extent that it suggests there is a significant difference in the number of cancers that can be screened by Galleri compared to other MCED tests in development, and it is incorrect to the extent it suggests that Galleri has been proven to screen for more cancers in an asymptomatic population than any other MCED test. Therefore, this Court should disregard the proposed finding.

[redacted]

[redacted]

[redacted]

839.7 Exact/Thrive's data shows only that its CancerSEEK assay can detect whether a patient has one of 10 types of cancer (and is unable to identify which one without further invasive testing in the form of a PET-CT scan). [redacted] RX3419 (Lennon et al., 2020); Cote Tr. 3811–14.)

Response to Finding No. 839.7

[redacted]

[redacted]

[redacted]

839.8 The published Singlera data is from a small, 418–sample case control study and shows only that Singlera's PanSeer assay potentially could detect five types of cancer. (RX3115 (Chen 2020) at 3.)

Response to Finding No. 839.8

The proposed finding is incorrect. Singlera has completed a proof-of-concept study of its PanSeer test in China on 100,000 people, identifying lung, esophageal, liver, colorectal, and gastric cancers at least four years before conventional diagnosis. (PX7042 (Gao (Singlera) IHT at 28-30); *see also* Gao (Singlera) Tr. 2878-79). Singlera's PanSeer MCED test is designed to detect all kinds of cancer, and not just the five cancers used in the Taizhou Longitudinal Study, with the goal of offering a "pan-cancer" test. (Gao (Singlera) Tr. 2881). Singlera has already invested between $60-100 million on the development of the PanSeer MCED test and expects to launch it as an FDA approved test by 2028. (Gao (Singlera) Tr. 2888-89; PX7042 (Gao (Singlera) IHT at 96)). Therefore, this Court should disregard the proposed finding.

840. Number of tests performed. Galleri differs from the MCED tests-in-development based on the number of tests of which it is comprised, in that Galleri consists of a single blood draw, whereas some of the tests in development actually comprise a series of tests.

Response to Finding No. 840

The proposed finding is unsupported by any evidence and should be disregarded. Because it does not contain a citation, it is not possible to verify the substance of the proposed finding. Furthermore, the proposed finding is vague because it does not define which "MCED tests-in-development" it is referring to or which tests "actually comprise a series of tests." Moreover, the weight of the evidence shows that Galleri will also need follow-up confirmation. Hans Bishop – Grail's former CEO – admitted at trial that there will need to be "diagnostic confirmation" of any positive diagnosis through either a tissue biopsy or through PET-CT scan. (Bishop (Grail) Tr. 1387). [redacted].

840.1 For example, Exact's CancerSEEK test is actually three separate tests in the form of its latest published trial: two blood draws and a PET-CT scan. (Lengauer (Exact/Thrive) Tr. 246–48.) [redacted]

840.4 [redacted]

Response to Finding No. 840.4

[redacted]

[redacted]

Grail's CEO, Hans Bishop, testified at trial that certain patients may have to undergo a body scan following a positive Galleri test to identify the cancer tissue of origin. (Bishop (Grail) Tr. 1387). The authors of Grail's CCGA-3 substudy also acknowledge that individuals who receive a positive Galleri result "may require a whole-body computed tomography (CT) or positron emission tomography (PET)-CT scan to localize the primary tumor." (RX3409 at 009 (E.A. Klein, et al., Clinical Validation of a Targeted Methylation-Based Multi-Cancer Early Detection Test Using an Independent Validation Set, 9 Annals of Oncology 1167 (2021)). [redacted]

[redacted] If Grail had already established the extent to which PET-CT and other types of diagnostic testing would be required to achieve diagnostic resolution when Galleri is used in a real-world setting, such a study would not be necessary. Interim results from PATHFINDER indicate that additional imaging testing was overwhelmingly required to achieve diagnostic resolution for patients who received positive Galleri results. According to the preliminary results of PATHFINDER, "[m]ost participants with diagnostic resolution had at least 1 imaging test (57/63; 90%)." RX3041 at 001 (Tomasz M. Beer, Interim Results of PATHFINDER, a Clinical Use Study Using a Methylation-Based Multi-Cancer Early Detection Test, 2021 ASCO Annual Meeting Presentation, June 4, 2021) (the presentation fails to disclose the share of imaging tests that were PET-CT tests). Over half of positive results in PATHFINDER were false positives; 25 percent of participants who received falsely positive Galleri results wound up undergoing at least one invasive procedure. RX3041 at 003 (Tomasz M. Beer, Interim Results of PATHFINDER, a Clinical Use Study Using a Methylation-Based Multi-Cancer Early Detection Test, 2021 ASCO Annual Meeting Presentation, June 4, 2021)). Therefore, this Court should disregard the proposed finding.

841. Cancer Signal of Origin. Galleri also differs from the MCED tests in development based on its ability to determine cancer signal of origin.

Response to Finding No. 841

[redacted]

[redacted]

[redacted]

[redacted]

841.1 Galleri is able to detect tissue of origin; that is, for positive cases, the test reveals where (lung, stomach, etc.) the detected cancer is likely located based on the same blood draw used to detect the cancer's presence. (*Supra* PFF ¶ 61.)

Response to Finding No. 841.1

The proposed finding is incomplete and misleading to the extent it suggests that Galleri's cancer signal of origin ("CSO") performance has been clinically established in Galleri's intended use population. Reliable clinical data does not yet exist about how Grail's cancer signal of origin feature would perform in an asymptomatic screening population.

The CCGA study did not involve a real-world population, but rather was a case-control study that involved individuals who had already been diagnosed with cancer. (*See* CCFF ¶¶ 6238-6241). Grail's Chief Medical Officer, Dr. Ofman, conceded at trial that the CCGA study did not involve the intended use population for Galleri. (Ofman (Grail) Tr. 3294-95). The authors of the Grail's CCGA-2 and CCGA-3 sub-studies themselves acknowledge that CCGA is not reflective of performance in a screening population. RX3430 at 10 (M.C. Liu, et al., Sensitive and Specific Multi-Cancer Detection and Localization Using Methylation Signatures in Cell-Free DNA, 6 Annals of Oncology 745 (2020) [CCGA-2] ("[T]o understand [Galleri's] performance in an asymptomatic screening population will require additional studies" beyond CCGA.")); (RX3409 at 010 (E.A. Klein, et al., Clinical Validation of a Targeted Methylation-Based Multi-Cancer Early Detection Test Using an Independent Validation Set, 9 Annals of Oncology 1167 (2021) [CCGA-3] ("CCGA is a case-control study, and as such, is not reflective of performance in a screening population.")). Among other factors, some of the blood samples in CCGA were "collected from participants with cancer after biopsies had been carried out," which the authors note "could increase the possibility that the tumor cfDNA fraction may increase relative to before the biopsy." Galleri's reported tissue of origin accuracy was worse for Stage I-II cancers than for Stage III-IV cancers in CCGA (*See* RX3430 at 6, Figure 4 (M.C. Liu, et al., Sensitive and Specific Multi-Cancer Detection and Localization Using Methylation

Signatures in Cell-Free DNA, 6 Annals of Oncology 745 (2020) [CCGA-2]). This fact suggests that Galleri's CSO performance will be worse in an asymptomatic screening population that does not include previously diagnosed Stage III and Stage IV cancer patients, as the CCGA study did.

The proposed finding is also misleading to the extent it suggests that Galleri's algorithmic cancer signal of origin prediction is capable of definitively localizing cancer "through liquid biopsy alone." [redacted] Additionally, a positive Galleri result "requires confirmatory diagnostic evaluation by medically established procedures (e.g. imaging) to confirm cancer," *notwithstanding* Galleri's "cancer signal of origin" feature. (PX0063 at 002 (Grail, https://grail.com/galleri/, accessed on Apr. 29, 2021). Indeed, Grail's CEO, Hans Bishop, admitted at trial that certain patients may have to undergo a body scan following a positive Galleri test to identify the cancer tissue of origin. (Bishop (Grail) Tr. 1387.)

[redacted] Grail's CEO, Hans Bishop, testified at trial that certain patients may have to undergo a body scan following a positive Galleri test to identify the cancer tissue of

origin. (Bishop (Grail) Tr. 1387). The authors of Grail's CCGA-3 substudy also acknowledge that individuals who receive a positive Galleri result "may require a whole-body computed tomography (CT) or positron emission tomography (PET)-CT scan to localize the primary tumor." (RX3409 at 009 (E.A. Klein, et al., Clinical Validation of a Targeted Methylation-Based Multi-Cancer Early Detection Test Using an Independent Validation Set, 9 Annals of Oncology 1167 (2021)). [redacted] If Grail had already established the extent to which PET-CT and other types of diagnostic testing would be required to achieve diagnostic resolution when Galleri is used in a real-world setting, such a study would not be necessary. Interim results from PATHFINDER indicate that additional imaging testing was overwhelmingly required to achieve diagnostic resolution for patients who received positive Galleri results. According to the preliminary results of PATHFINDER, "[m]ost participants with diagnostic resolution had at least 1 imaging test (57/63; 90%)." RX3041 at 001 (Tomasz M. Meeting Presentation, June 4, 2021) (the presentation fails to disclose the share of imaging tests that were PET-CT tests). Over half of positive results in PATHFINDER were false positives; 25 percent of participants who received falsely positive Galleri results wound up undergoing at least one invasive procedure. RX3041 at 003 (Tomasz M. Beer, Interim Results of PATHFINDER, a Clinical Use Study Using a Methylation-Based Multi-Cancer Early Detection Test, 2021 ASCO Annual Meeting Presentation, June 4, 2021)). [redacted]

Therefore, this Court should disregard the proposed finding.

841.2 No other MCED test-in-development has demonstrated this capability. (*Supra* PFF ¶ 684.2.)

Response to Finding No. 841.2

The proposed finding is vague because the phrase "this capability" is ambiguous and undefined; it is unclear what capability Respondents are referencing. The proposed finding should be disregarded for this reason alone.

[redacted]

The proposed finding is also incomplete and misleading to the extent it suggests that

Galleri's cancer signal of origin ("CSO") performance has been clinically established in Galleri's intended use population. Reliable clinical data does not yet exist about how Grail's cancer signal of origin feature would perform in an asymptomatic screening population.

[redacted]

[redacted] Grail's Chief Medical Officer, Dr. Ofman, conceded at trial that the CCGA study did not involve the intended use population for Galleri. (Ofman (Grail) Tr. 3294-95). The authors of the Grail's CCGA-2 and CCGA-3 sub-studies themselves acknowledge that CCGA is not reflective of performance in a screening population. RX3430 at 10 (M.C. Liu, et al., Sensitive and Specific Multi-Cancer Detection and Localization Using Methylation Signatures in Cell-Free DNA, 6 Annals of Oncology 745 (2020) [CCGA-2] ("[T]o understand [Galleri's] performance in an asymptomatic screening population will require additional studies" beyond CCGA.")); (RX3409 at 010 (E.A. Klein, et al., Clinical Validation of a Targeted Methylation-Based Multi-Cancer Early Detection Test Using an Independent Validation Set, 9 Annals of Oncology 1167 (2021) [CCGA-3] ("CCGA is a case-control study, and as such, is not reflective of performance in a screening population.")). Among other factors, some of the blood samples in CCGA were "collected from participants with cancer after biopsies had been carried out," which the authors note "could increase the possibility that the tumor cfDNA fraction may increase relative to before the biopsy." Galleri's reported tissue of origin accuracy was worse for Stage I-II cancers than for Stage III-IV cancers in CCGA (*See* RX3430 at 6, Figure 4 (M.C. Liu, et al., Sensitive and Specific Multi-Cancer Detection and Localization Using Methylation Signatures in Cell-Free DNA, 6 Annals of Oncology 745 (2020) [CCGA-2]). This fact suggests that Galleri's CSO performance will be worse in an asymptomatic screening population that does

not include previously diagnosed Stage III and Stage IV cancer patients, as the CCGA study did.

[redacted] Additionally, a positive Galleri result "requires confirmatory diagnostic evaluation by medically established procedures (e.g. imaging) to confirm cancer," *notwithstanding* Galleri's "cancer signal of origin" feature. (PX0063 at 002 (Grail, https://grail.com/galleri/, accessed on Apr. 29, 2021). Indeed, Grail's CEO, Hans Bishop, admitted at trial that certain patients may have to undergo a body scan following a positive Galleri test to identify the cancer tissue of origin. (Bishop (Grail) Tr. 1387.) Therefore, this Court should disregard the proposed finding.

> 841.3 For example, Thrive's CancerSEEK cannot detect tissue of origin and instead requires a diagnostic full-body PET-CT scan both to confirm the results of the blood testing—*i.e.*, that cancer has in fact been detected— and also to localize the potential cancer. (Lengauer (Exact/Thrive) Tr. 246–48.)

Response to Finding No. 841.3

[redacted]

[redacted]

The proposed finding is also incomplete and misleading to the extent it suggests that Galleri's cancer signal of origin ("CSO") performance has been clinically established in Galleri's intended use population. Reliable clinical data does not yet exist about how Grail's cancer signal of origin feature would perform in an asymptomatic screening population.

[redacted] Grail's Chief Medical Officer, Dr. Ofman, conceded at trial that the CCGA study did not involve the intended use population for Galleri. (Ofman (Grail) Tr. 3294-95). The authors of the Grail's CCGA-2 and CCGA-3 sub-studies themselves acknowledge that CCGA is not reflective of performance in a screening population. RX3430 at 10 (M.C. Liu, et al., Sensitive and Specific Multi-Cancer Detection and Localization Using Methylation Signatures in Cell-Free DNA, 6 Annals of Oncology 745 (2020) [CCGA-2] ("[T]o understand [Galleri's] performance in an asymptomatic screening population will require additional studies" beyond CCGA.")); (RX3409 at 010 (E.A. Klein, et al., Clinical Validation of a Targeted Methylation-Based Multi-Cancer Early Detection Test Using an Independent Validation Set, 9 Annals of Oncology 1167 (2021) [CCGA-3] ("CCGA is a case-control study, and as such, is not reflective of performance in a screening population.")). Among other factors, some of the blood samples in CCGA were "collected from participants with cancer after biopsies had been carried out," which the authors note "could increase the possibility that the tumor cfDNA fraction may

increase relative to before the biopsy." Galleri's reported tissue of origin accuracy was worse for Stage I-II cancers than for Stage III-IV cancers in CCGA (*See* RX3430 at 6, Figure 4 (M.C. Liu, et al., Sensitive and Specific Multi-Cancer Detection and Localization Using Methylation Signatures in Cell-Free DNA, 6 Annals of Oncology 745 (2020) [CCGA-2]). This fact suggests that Galleri's CSO performance will be worse in an asymptomatic screening population that does not include previously diagnosed Stage III and Stage IV cancer patients, as the CCGA study did.

The proposed finding is incomplete and misleading to the extent that it suggests that there is agreement or consensus that algorithmic tissue of origin prediction will ultimately prove superior to other methods of identifying the location of cancer as part of MCED testing, such as PET-CT.

[redacted]

841.4 Similarly, Singlera has said that any patient testing positive would then undergo additional blood testing and/or follow-up imaging to detect cancer signal of origin. (RX3115 (Chen 2020) at 6.)

Response to Finding No. 841.4

The proposed finding is misleading and incomplete. It cites a scientific article from 2020 with many authors, not just people representing Singlera. Singlera's CEO, Dr. Gao, testified at

trial that Singlera's PanSeer MCED test is designed to detect multiple cancer types, as well as "the origin of location." (Gao (Singlera) Tr. 2874).

[redacted]

A positive Galleri result "requires confirmatory diagnostic evaluation by medically established procedures (e.g. imaging) to confirm cancer," *notwithstanding* Galleri's "cancer signal of origin" feature. (PX0063 at 002 (Grail, https://grail.com/galleri/, accessed on Apr. 29, 2021). Indeed, Grail's CEO, Hans Bishop, admitted at trial that certain patients may have to undergo a body scan following a positive Galleri test to identify the cancer tissue of origin. (Bishop (Grail) Tr. 1387.)

Interim results from PATHFINDER, an actual interventional trial for Galleri, indicate that additional imaging testing was required for positive results 90 percent of the time. (RX3041 at 001 (Tomasz M. Beer, Interim Results of PATHFINDER, a Clinical Use Study Using a Methylation-Based Multi-Cancer Early Detection Test, 2021 ASCO Annual Meeting

Presentation, June 4, 2021) ("Most participants with diagnostic resolution had at least 1 imaging test (57/63; 90%)."). Over half the positive results in PATHFINDER with diagnostic resolution were determined to be false positives (55.4%) and 25 percent of participants who received falsely positive results underwent at least one invasive procedure. (RX3041 at 004 (Tomasz M. Beer, Interim Results of PATHFINDER, a Clinical Use Study Using a Methylation-Based Multi-Cancer Early Detection Test, 2021 ASCO Annual Meeting Presentation, June 4, 2021)).

[redacted]

841.5 [redacted]

Response to Finding No. 841.5

[redacted] Additionally, a positive Galleri result "requires confirmatory diagnostic evaluation by medically established procedures (e.g. imaging) to confirm cancer," *notwithstanding* Galleri's "cancer signal of origin" feature. (PX0063 at 002

(Grail, https://grail.com/galleri/, accessed on Apr. 29, 2021). Indeed, Grail's CEO, Hans Bishop, admitted at trial that certain patients may have to undergo a body scan following a positive Galleri test to identify the cancer tissue of origin. (Bishop (Grail) Tr. 1387.).

[redacted]

841.6 [redacted]

Response to Finding No. 841.6

[redacted]

[redacted]

841.7 [redacted]

Response to Finding No. 841.7

[redacted]

[redacted]

Grail's CEO, Hans Bishop, testified at trial that certain patients may have to undergo a body scan following a positive Galleri test to identify the cancer tissue of origin. (Bishop (Grail) Tr. 1387). The authors of Grail's CCGA-3 substudy also acknowledge that individuals who receive a positive Galleri result "may require a whole-body computed tomography (CT) or positron emission tomography (PET)-CT scan to localize the primary tumor." (RX3409 at 009 (E.A. Klein, et al., Clinical Validation of a Targeted Methylation-Based Multi-Cancer Early Detection Test Using an Independent Validation Set, 9 Annals of Oncology 1167 (2021)). [redacted]

[redacted] If Grail had already established the extent to which PET-CT and other types of diagnostic testing would be required to achieve diagnostic resolution when Galleri is used in a real-world setting, such a study would not be necessary. Interim results from PATHFINDER indicate that additional imaging testing was overwhelmingly required to achieve diagnostic resolution for patients who received positive Galleri results. According to the preliminary results of PATHFINDER, "[m]ost participants with diagnostic resolution had at least 1 imaging test (57/63; 90%)." RX3041 at 001 (Tomasz M. Beer, Interim Results of PATHFINDER, a Clinical Use Study Using a Methylation-Based Multi-Cancer Early Detection Test, 2021 ASCO Annual Meeting Presentation, June 4, 2021) (the presentation fails to disclose the share of imaging tests that were PET-CT tests). Over half of positive results in PATHFINDER were false positives; 25 percent of participants who received falsely positive Galleri results wound up undergoing at least one invasive procedure. RX3041 at 003 (Tomasz M. Beer, Interim Results of PATHFINDER, a Clinical Use Study Using a Methylation-Based Multi-Cancer Early Detection Test, 2021 ASCO Annual Meeting Presentation, June 4, 2021)). Therefore, this Court should disregard the proposed finding.

841.8 [redacted]

Response to Finding No. 841.8

[redacted]

The proposed finding is incomplete and misleading to the extent that it suggests that there is agreement or consensus that algorithmic tissue of origin prediction will ultimately prove superior to other methods of identifying the location of cancer as part of MCED testing, such as PET-CT. [redacted]

[redacted]

841.9 [redacted]

Response to Finding No. 841.9

[redacted]

841.10 However, Dr. Abrams, the only expert primary care physician to testify in this case, explained that the ability to detect tissue of origin is a key differentiating feature that will influence physician and patient choice. (Abrams Tr. 3624.)

Response to Finding No. 841.10

The proposed finding is unreliable. In forming his opinions, Dr. Abrams did not consult any surveys of primary care physicians outside of his practice and did not rely on any specific

conversations with other physicians. (Abrams Tr. 3682). Dr. Abrams also did not conduct any surveys himself to obtain information about the importance of tissue of origin as a differentiating feature that may influence physician and patient choice. (Abrams Tr. 3682). [redacted] Therefore, Dr. Abrams' opinion related to this finding is unreliable and should be given little weight.

The proposed finding is incomplete and misleading to the extent that it suggests that there is agreement or consensus that algorithmic tissue of origin prediction will ultimately prove superior to other methods of identifying the location of cancer as part of MCED testing, such as PET-CT. [redacted]

[redacted]

[redacted]

841.11 [redacted]

Response to Finding No. 841.11

[redacted]

Response to Finding No. 841.12

[redacted]

[redacted]

[redacted]

842. Sensitivity. Galleri differs from the MCED tests-in-development based on its degree of sensitivity, meaning how often a test correctly returns a positive result for an individual who has the cancer for which they are being screened. (*Supra* PFF ¶ 172.)

Response to Finding No. 842

[redacted]

[redacted]

Singlera's Taizhou study demonstrated the PanSeer has a sensitivity of "88 to 90 percent and [a] specificity of 96 percent" for the cancers used in the study. (Gao (Singlera) Tr. 2876). [redacted]

[redacted] The DETECT-A study established CancerSEEK's sensitivity was 52 percent, detecting double the number of cancers first detected by standard screening methods. (Lengauer (Third Rock Ventures) Tr. 168-69). [redacted]

The proposed finding is also incomplete and misleading to the extent that it suggests that Grail is able to claim today what the sensitivity of its MCED test will be in Galleri's intended use population (i.e. in an asymptomatic screening population). The authors of the CCGA-3 sub-study – which Respondents rely upon for their 50-cancer claims – make this point explicitly in their article, cautioning that "CCGA is a case-control study, and as such, is not reflective of performance in a screening population." (RX3409 at 010 (E.A. Klein, et al., Clinical Validation of a Targeted Methylation-Based Multi-Cancer Early Detection Test Using an Independent Validation Set, 9 Annals of Oncology 1167 (2021)). The authors of the CCGA-2 sub-study provide the same caveat about CCGA, stating: "to understand [Galleri's] performance in an asymptomatic screening population will require additional studies" beyond CCGA. (RX3430 at 10 (M.C. Liu, et al., Sensitive and Specific Multi-Cancer Detection and Localization Using Methylation Signatures in Cell-Free DNA, 6 Annals of Oncology 745 (2020)). Grail admits as much itself. [redacted]

[redacted]

842.1 [redacted]

Response to Finding No. 842.1

[redacted]

[redacted]

Singlera's Taizhou study demonstrated the PanSeer has a sensitivity of "88 to 90 percent and [a] specificity of 96 percent" for the cancers used in the study. (Gao (Singlera) Tr. 2876). [redacted] The DETECT-A study established CancerSEEK's sensitivity was 52 percent, detecting double the number of cancers first detected by standard screening methods. (Lengauer (Third Rock Ventures) Tr. 168-69). [redacted]

The proposed finding is also incomplete and misleading to the extent that it suggests that Grail is able to claim today what the sensitivity of its MCED test will be in Galleri's intended use

population (*i.e.* in an asymptomatic screening population). The authors of the CCGA-3 sub-study – which Respondents rely upon for their 50-cancer claims – make this point explicitly in their article, cautioning that "CCGA is a case-control study, and as such, is not reflective of performance in a screening population." (RX3409 at 010 (E.A. Klein, et al., Clinical Validation of a Targeted Methylation-Based Multi-Cancer Early Detection Test Using an Independent Validation Set, 9 Annals of Oncology 1167 (2021)). The authors of the CCGA-2 sub-study provide the same caveat about CCGA, stating: "to understand [Galleri's] performance in an asymptomatic screening population will require additional studies" beyond CCGA. (RX3430 at 10 (M.C. Liu, et al., Sensitive and Specific Multi-Cancer Detection and Localization Using Methylation Signatures in Cell-Free DNA, 6 Annals of Oncology 745 (2020)). Grail admits as much itself. [redacted]

[redacted]

842.2 [redacted]

Response to Finding No. 842.2

[redacted]

[redacted]

Singlera's Taizhou study demonstrated the PanSeer has a sensitivity of "88 to 90 percent and [a] specificity of 96 percent" for the cancers used in the study. (Gao (Singlera) Tr. 2876). [redacted] The DETECT-A study established CancerSEEK's sensitivity was 52 percent, detecting double the number of cancers first detected by standard screening methods. (Lengauer (Third Rock Ventures) Tr. 168-69). [redacted]

The proposed finding is also incomplete and misleading to the extent that it suggests that Grail is able to claim today what the sensitivity of its MCED test will be in Galleri's intended use population (i.e. in an asymptomatic screening population). The authors of the CCGA-3 sub-study – which Respondents rely upon for their 50-cancer claims – make this point explicitly in their article, cautioning that "CCGA is a case-control study, and as such, is not reflective of performance in a screening population." (RX3409 at 010 (E.A. Klein, et al., Clinical Validation

of a Targeted Methylation-Based Multi-Cancer Early Detection Test Using an Independent Validation Set, 9 Annals of Oncology 1167 (2021)). The authors of the CCGA-2 sub-study provide the same caveat about CCGA, stating: "to understand [Galleri's] performance in an asymptomatic screening population will require additional studies" beyond CCGA. (RX3430 at 10 (M.C. Liu, et al., Sensitive and Specific Multi-Cancer Detection and Localization Using Methylation Signatures in Cell-Free DNA, 6 Annals of Oncology 745 (2020)). Grail admits as much itself. [redacted]

843. Specificity. Galleri also differs from the MCED tests in development based on its degree of specificity, meaning how often a test correctly returns a negative result for an individual who does not have the cancers for which they are being screened; the higher the specificity, the lower the false positive rate. (*Supra* PFF ¶ 173.)

Response to Finding No. 843

[redacted]

[redacted]

[redacted]

843.1 [redacted]

Response to Finding No. 843.1

[redacted]

[redacted]

843.2 Further, most of the tests-in-development are focused on cancers with existing standard-of-care screening protocols (*supra* PFF ¶¶ 482, 701–705), for which a high sensitivity is necessary but a lower specificity is acceptable given the ability to turn to standard-of-care screening to assess whether a positive case is a true positive. (Cote Tr. 3829.) As Dr. Cote explained:

> "[T]he requirements for a single cancer screening test, particularly one that has a standard of care screen that can be reflexed to . . . are very different from a multicancer screening test. What is

> really required . . . in the colorectal assay would be a high level of sensitivity, hopefully superior to that of the standard of care screening, which is a colonoscopy, and the lower level of specificity and the increase in the false-positive rate can be tolerated because the reflex here would be colonoscopy, which would be the direct visualization of the colon." (Cote Tr. 3829.)

[redacted]

[redacted]

[redacted]

843.4 As the table below also shows (*see supra* PFF Table 7), the specificity of the MCED tests-in-development to which Complaint Counsel points, for which there is any specificity information in the record, differ from specificities for the cancers detected by Galleri.

Table 7

Test	Galleri (GRAIL) 1 Blood Test	CancerSEEK (Exact/Thrive)			PanSeer (Singlera) 1 Blood Test
		1 Blood Test	2 Blood Tests	2 Blood + PET-CT	
Study	CCGA3	DETECT-A			Taizhou L.S.
Types of Cancer	50	10			5
Cancer Signal of Origin	Yes	No	No	Yes	No
Specificity	99.5%	95.3%	98.9%	99.6%	96.1%
Sensitivity	51.5%	30.2%	27.1%	15.6%	94.9%
PPV	44.4%	5.9%	19.4%	28.3%	

(RX3409 (Klein 2021); RX3419 (Lennon et al., 2020); RX3115 (Chen 2020).)

Response to Finding No. 843.4

The proposed finding misleading, incomplete, and against the weight of the evidence.

The proposed finding is misleading because the weight of the evidence shows that the CCGA

study is not indicative of Galleri's performance in the intended use (asymptomatic) population as explained below. Any attempt to directly compare the results in DETECT-A (an interventional study involving asymptomatic individuals) and Taizhou (an observational study involving asymptomatic individuals) with CCGA (a case-control study involving diagnosed cancer patients, including patients with Stage IV cancer) meaningless and inherently unreliable. They are fundamentally different types of studies. Dr. Ofman of Grail conceded that "[t]o find all 50 cancer types in a real-world population would require hundreds of thousands of people[.]" (RCFF ¶ 398.4 (quoting Ofman (Grail) Tr. 3298).

[redacted]

The authors of the CCGA-3 sub-study itself make this point explicitly in their article, cautioning that "CCGA is a case-control study, and as such, is not reflective of performance in a screening population." (RX3409 at 010 (E.A. Klein, et al., Clinical Validation of a Targeted Methylation-Based Multi-Cancer Early Detection Test Using an Independent Validation Set, 9 Annals of Oncology 1167 (2021)). The authors of the CCGA-2 sub-study provide the same caveat about CCGA, stating: "to understand [Galleri's] performance in an asymptomatic screening population will require additional studies" beyond CCGA. (RX3430 at 10 (M.C. Liu, et al., Sensitive and Specific Multi-Cancer Detection and Localization Using Methylation Signatures in Cell-Free DNA, 6 Annals of Oncology 745 (2020)). Accordingly, the proposed finding is misleading and unsupported to the extent that there is reliable evidence today of the combined sensitivity and specificity at which Grail will perform in an asymptomatic screening population.

To put the above points plainly, a case control study will tend to produce inflated performance results relative to how a test would performance in an asymptomatic screening population (the actual population in which MCED tests are intended to be used). Notwithstanding this, and notwithstanding the above admissions, Respondents nonetheless attempt to compare their case-control results to results from studies involving asymptomatic populations and pretend as if they are comparing apples to apples. They are not; the attempt

itself is inherently misleading.

[redacted]

843.5 [redacted]

Response to Finding No. 843.5

[redacted]

[redacted]

843.6 [redacted]

Response to Finding No. 843.6

[redacted]

[redacted]

[redacted]

844. The only medical experts called to testify agree that Galleri is very different from the MCED tests in development. (PX6097 (Abrams Expert Report) ¶ 42; Cote Tr. 3727, 3777–78, 3782–83.)

Response to Finding No. 844

The proposed finding is vague, misleading, and unreliable. It is vague because it does not elaborate on what "very different from the MCED tests in development" means or why that matters. It is misleading and unreliable because Dr. Cote is not a "medical expert," and his testimony deserves no weight. Dr. Cote offered opinion testimony in this matter that spans multiple disparate subjects and exceeds his expertise; his trial testimony also contained unsupported claims about his experience related to MCED test development that exceed the information disclosed in his report in violation of this Court's order; [redacted] Dr. Cote is also not qualified to provide expert opinion testimony about [redacted]

[redacted] Therefore, Dr. Cote's opinion related to this finding is unreliable and should be given little weight. In addition to Dr. Cote being unqualified and not credible, his opinion about the acceptability of certain features on an MCED test is unreliable given that his analysis has not been subject to nor is it reflected in any peer reviewed publication, is not supported by any well-known regulatory guidance or scientific standard, and does not appear to be accepted by any relevant scientific community.

Moreover, the proposed finding is unreliable because, in forming his opinions, Dr. Abrams did not consult any surveys of primary care physicians outside of his practice and did not rely on any specific conversations with other physicians. (Abrams Tr. 3682). Dr. Abrams also did not conduct any surveys himself to obtain information about the importance of various MCED test features that may influence physician and patient choice. (Abrams Tr. 3682). Dr. Abrams is too biased and unqualified to opine on whether or how [redacted] Therefore, Dr. Abrams' opinion related to this finding is unreliable and should be given little weight. Therefore, this Court should disregard the proposed finding.

844.1 [redacted]

Response to Finding No. 844.1

[redacted]

[redacted]

[redacted]

[redacted]

844.2 Dr. Cote opined that other MCED tests in development would not be substitutes for Galleri, both because of their inability to detect cancer signal of origin, as well as other performance metrics such as sensitivity and specificity. (Cote Tr. 3727, 3777–78, 3782–83.)

Response to Finding No. 844.2

The proposed finding is vague, relies on improper expert opinion, incomplete, misleading, against the weight of the evidence. The proposed finding is vague because Dr. Cote is not an economist, and so it is unclear what he means by his use of the term "substitutes." It is vague because it does not specifically refer to any MCED tests in development, only "other" MCED tests. It also does not define what "other performance metrics" Dr. Cote may have been referring to. Further, it is misleading because [redacted]

The proposed finding relies on improper expert opinion. Dr. Cote is not qualified to provide expert opinion testimony about [redacted] Dr. Cote is also not qualified to provide expert opinion testimony about [redacted]

The proposed finding is against the weight of the evidence to the extent it suggests that there is agreement or consensus that algorithmic tissue of origin prediction will ultimately prove superior to other methods of identifying the location of cancer as part of MCED testing, such as PET-CT. [redacted]

[redacted]

The proposed finding is also misleading to the extent it suggests that the performance of Galleri's algorithmic tissue of origin prediction feature has been clinically established in the intended use population for Galleri. [redacted]

[redacted] Additionally, a positive Galleri result "requires confirmatory diagnostic evaluation by medically established procedures (e.g. imaging) to confirm cancer," *notwithstanding* Galleri's "cancer signal of origin" feature. (PX0063 at 002 (Grail, https://grail.com/galleri/, accessed on Apr. 29, 2021). Indeed, Grail's CEO, Hans Bishop, admitted at trial that certain patients may have to undergo a body scan following a positive Galleri test to identify the cancer tissue of origin. (Bishop (Grail) Tr. 1387.)

The proposed finding is also incorrect that [redacted] Grail's CEO, Hans Bishop, testified at trial that certain patients may have to undergo a body scan following a positive Galleri test to identify the cancer tissue of origin. (Bishop (Grail) Tr. 1387). The authors of Grail's CCGA-3 substudy also acknowledge that individuals who receive a positive Galleri result "may require a whole-body computed tomography (CT) or positron emission tomography (PET)-CT scan to localize the primary tumor." (RX3409 at 009 (E.A. Klein, et al., Clinical Validation of a Targeted Methylation-Based Multi-Cancer Early Detection Test Using an Independent Validation Set, 9 Annals of Oncology 1167 (2021)). [redacted]

[redacted] Interim results from PATHFINDER indicate that additional imaging testing was overwhelmingly required to achieve diagnostic resolution for patients who received positive Galleri results. According to the preliminary results of PATHFINDER, "[m]ost participants with diagnostic resolution had at least 1 imaging test (57/63; 90%)." RX3041 at 001 (Tomasz M. Beer, Interim Results of PATHFINDER, a Clinical Use Study Using a Methylation-Based Multi-Cancer Early Detection Test, 2021 ASCO Annual Meeting Presentation, June 4, 2021) (the presentation fails to disclose the share of imaging tests that were PET-CT tests). Over half of positive results in PATHFINDER were false positives; 25 percent of participants who received falsely positive Galleri results wound up undergoing at least one invasive procedure. RX3041 at 003 (Tomasz M. Beer, Interim Results of PATHFINDER, a Clinical Use Study Using a Methylation-Based Multi-Cancer Early Detection Test, 2021 ASCO Annual Meeting Presentation, June 4, 2021)).

Dr. Cote is not a credible witness, so his opinion does not deserve any weight. Dr. Cote offered opinion testimony in this matter that spans multiple disparate subjects and exceeds his expertise; his trial testimony also contained unsupported claims about his experience related to

MCED test development that exceed the information disclosed in his report in violation of this Court's order; [redacted] Specifically, Dr. Cote is not qualified to provide expert opinion testimony about [redacted] Dr. Cote is also not qualified to provide expert opinion testimony about [redacted] For all the above reasons, this Court should disregard the proposed finding.

844.3 Dr. Cote testified:

[redacted]

[redacted]

Response to Finding No. 844.3

[redacted]

[redacted]

[redacted]

[redacted]

[redacted]

845. [redacted]

Response to Finding No. 845

[redacted]

[redacted]

5. **No basis to predict limited-cancer tests will develop to close rivals to Galleri in foreseeable future.**

846. Expanding a single cancer test to a 50–cancer test is not a viable approach to developing a test like Galleri in the foreseeable future:

Response to Finding No. 846

The proposed finding is completely unsupported by evidence. This Court's Post-Trial Order explicitly requires that all facts be supported by "specific references to the evidentiary record." (*See* Order on Post-Trial Findings at 2). This proposed finding should be disregarded for violating the Court's Order and 16 C.F.R. § 3.46. It is also vague and misleading. It is unclear which single cancer test or 50-cancer test the finding is referring to, what a "test like Galleri" means, or what time frame the Respondents mean by "the foreseeable future." It is also misleading insofar as it suggests that Galleri, or a "test like Galleri," is a "50-cancer test." As

described elsewhere in Complaint Counsel's responses, Galleri has not demonstrated the ability to screen for 50 cancers in an asymptomatic population. [redacted]

> 846.1 As Dr. Aravanis explained, for each cancer included in an MCED like Galleri, the developer has "to go through a somewhat similar process to what GRAIL did", meaning "a research phase", "a test development phase", and "a clinical phase", and that must be done "for each cancer", which, if done "serially" would take a "very long time" and is "not practical". (Aravanis (Illumina) Tr. 1895–96.)

Response to Finding No. 846.1

The proposed finding is misleading to the extent it suggests that MCED test developers all must follow an identical, one-size-fits-all, artificial development and commercialization roadmap and timeline. It also reflects self-serving testimony from an Illumina executive, Dr.

Aravanis. Dr. Aravanis's also does not have the foundation to testify as to other MCED test developers process.

[redacted]

[redacted]

846.2 Dr. Aravanis further explained that it is not "straightforward to expand [a single cancer test] to all other cancers" because **"**to develop a test for a new indication, like a new cancer, you have to go get samples related to that different cancer. You have to find the signals. Then you have to develop a technology for that. Then you have to do a -- the relevant clinical trial. There's no shortcut. . . . [T]here's hundreds of diagnostics developed" and "I've never heard of an example where because you developed a test for

one thing, you can now – it's a shortcut to develop a test for something different." (Aravanis (Illumina) Tr. 1901–02).

Response to Finding No. 846.2

The proposed finding is misleading to the extent it suggests that MCED test developers all must follow an identical, one-size-fits-all, artificial development and commercialization roadmap and timeline, or that Dr. Aravanis knows about every way that such tests may be developed. It also reflects self-serving testimony from Dr. Aravanis, an Illumina executive. Dr. Aravanis also does not have the foundation to testify regarding the development process of other MCED developers.

[redacted]

[redacted]

[redacted]

846.3 Similarly, Dr. Cote testified that developing a single-cancer test does not put a test developer "in a position where they're ahead in developing a cancer screening test for a different cancer" because the "development of biomarkers for a particular cancer will not be adequate for other cancers" and, for each cancer, the developer must "go through the case-control verification to determine whether or not the assay has the performance characteristics needed for . . . the new target cancer, and then has to go through a prospective trial depending on which cancer is being targeted" – a process that can take years and with no certainty of a successful outcome. (Cote Tr. 3787.)

Response to Finding No. 846.3

The proposed finding is misleading to the extent it suggests that MCED test developers all must follow an identical, one-size-fits-all, artificial development and commercialization roadmap and timeline that Dr. Cote invented in his flawed analysis. Dr. Cote is also not qualified to provide expert opinion testimony about [redacted].

[redacted]

[redacted]

[redacted]

F. Complaint Counsel Failed to Account for the Impact Any Attempted Foreclosure would have on Illumina's NGS Sales and Reputation.

1. Illumina's Core Business Consists Of Selling NGS Instruments And Consumables.

847. Illumina's core business consists of selling NGS instruments and consumables. (*Supra* PFF ¶ 22.)

Response to Finding No. 847

The proposed finding is vague to the extent "core business" is undefined and ambiguous. The proposed finding is also unsupported and conclusory to the extent it cites only to Respondents' other proposed findings of fact. Therefore, this Court should disregard the proposed finding.

848. Illumina's NGS products comprise the vast majority (more than 90%) of its revenues and profits. (*Supra* PFF ¶ 22.)

Response to Finding No. 848

The proposed finding is unsupported and conclusory to the extent it cites only to Respondents' other proposed findings of fact. Moreover, nothing in the cited material speaks to

Illumina's profits. The proposed finding is also irrelevant. As explained in Complaint Counsel's post-trial briefing, notwithstanding the fact that MCED testing is a small percentage of Illumina's core business today, Illumina's pre-Acquisition ordinary course documents show that Illumina seeks to fundamentally evolve its business to shift to clinical services in the future. Therefore, this Court should disregard the proposed finding.

849. Illumina's NGS business is expected to be the dominant driver of Illumina's profits well into the future:

Response to Finding No. 849

The proposed finding is incomplete, and without evidentiary support. Additionally, the proposed finding is vague and ambiguous to the extent the phrases "dominant driver" and "well into the future" are undefined. The proposed finding is also irrelevant. [redacted] Therefore, this Court should disregard the proposed finding.

849.1 As Mr. deSouza explained, "[t]he vast majority of Illumina's revenue in the next ten years will come from our sequencing business, our sequencers and consumables." (deSouza (Illumina) Tr. 2291.) Because Illumina's "core business is to sell sequencers and consumables", its "strong incentive is to continue to be successful selling sequencers and consumables into the market segments that we serve." (deSouza (Illumina) Tr. 2378.)

Response to Finding No. 849.1

The proposed finding is incomplete and misleading. [redacted]

[redacted]

[redacted]

849.2 Dr. Aravanis similarly testified that "Illumina's business is based on growing sequencing markets" by "lowering the cost, allowing people to do more sequencing" and "has also been driven by new applications that are developed", and "Illumina is hoping for more of those applications to be developed" on its platforms, which creates "a strong incentive for us to continue to decrease cost, and that's our plan." (Aravanis (Illumina) Tr. 1922.)

Response to Finding No. 849.2

The proposed finding is incomplete and misleading. [redacted]

[redacted]

[redacted]

849.3 Dr. Goswami testified that the majority of Illumina's revenues come from NGS tools, and the Transaction "keeps our commitment to delivering NGS solutions to the broad sector of customers we serve." (PX7087 (Goswami (Illumina) Dep. at 145–46).)

Response to Finding No. 849.3

The proposed finding is incomplete and misleading. [redacted]

[redacted]

[redacted]

850. Any attempt by Illumina to foreclose GRAIL's alleged rivals would harm Illumina's core NGS business, because it would result in the loss of highly profitable NGS sales in MCED and non-MCED applications. (deSouza (Illumina) Tr. 2378; [redacted], 86).)

Response to Finding No. 850

The proposed finding is incomplete and misleading. [redacted]

[redacted]

[redacted]

850.1 Those sales either would divert to rival sequencing platforms, such as those in active development described above, or they would dissipate because customers would respond to foreclosure by choosing to no longer invest in NGS applications on Illumina systems. (RX6000 (Carlton Trial Dep. at 33–37); deSouza (Illumina) Tr. 2380–81; Febbo (Illumina) Tr. 4331–32; [redacted] 86.)

Response to Finding No. 850.1

The proposed finding is vague, incomplete, and misleading. [redacted]

[redacted]

[redacted]

850.2 In either case, the loss to Illumina would be enormous – unless, contrary to fact, Illumina was assured of recouping a substantial volume of the resulting loss in profits through diversion to GRAIL. (RX3864 (Carlton Expert Report) ¶ 86.)

Response to Finding No. 850.2

The proposed finding is vague, incomplete, and misleading. It is vague because it is unclear what "in either case" means, or what an "enormous" loss or "recouping a substantial volume of the resulting loss" means. It misleading because [redacted]

It is also misleading because, [redacted] As Dr. Carlton noted in his report, [redacted]

[redacted]

[redacted]

850.3 As Mr. deSouza explained, "if we [raised prices] we would lose [our customers'] business. They would move on to . . . a BGI or a Thermo", that is, Illumina would lose upstream revenues it earns today and expects in the future both from MCED developers and other customers. (deSouza (Illumina) Tr. 2379–80.)

Response to Finding No. 850.3

The proposed finding is vague, incomplete, and misleading. It is vague because it does not specify what "other customers" Illumina may lose revenue from. It is misleading because Illumina need not raise prices to its customers across the board in order to raise prices (or otherwise foreclose) MCED test developers. Illumina has the ability to identify and discriminate against MCED test developers posing competitive threats to Grail's Galleri test. (*see* CCFF ¶¶ 2608-2701).

It is also misleading because, for MCED testing, Illumina is the only NGS sequencing provider that meets the requirements of MCED test developers. [redacted]

[redacted]

[redacted]

[redacted]

850.4 Dr. Febbo similarly confirmed that attempted foreclosure would "really disincentivize an R&D lab or clinical labs from using our platforms, which would have a major impact on our business" through lost NGS sales. (Febbo (Illumina) Tr. 4331–32.)

Response to Finding No. 850.4

The proposed finding is vague, incomplete, and misleading. It is vague because it does not specify what "R&D lab[s] or clinical labs" would be disincentivized from using Illumina platforms as a result of foreclosure of MCED test developers. It is misleading because Illumina need not raise prices to such customers in order to raise prices (or otherwise foreclose) MCED test developers. Illumina has the ability to identify and discriminate against MCED test developers posing competitive threats to Grail's Galleri test. (*see* CCFF ¶¶ 2608-2701).

It is also misleading because, for MCED testing, Illumina is the only NGS sequencing provider that meets the requirements of MCED test developers. [redacted]

[redacted]

[redacted]

[redacted]

851. [redacted]

Response to Finding No. 851

[redacted]

[redacted]

[redacted]

[redacted]

852. Dr. Scott Morton admitted that she did not quantify the per-test gross profits Illumina earns from selling sequencing products used by any hypothetical MCED rival for non-screening tests or the gross profits that Illumina would lose if, as a result of attempted foreclosure of an MCED test developer, the test developer moves all of its tests, including non-MCED tests, to a different platform. (RX3852 (Scott Morton Dep. at 242–44).)

Response to Finding No. 852

The proposed finding mischaracterizes Dr. Scott Morton's testimony. In the cited portion of the deposition transcript, Dr. Scott Morton did not admit to not quantifying and comparing gross profits earned by Illumina depending on whether it decides to foreclose Grail's rival MCED test developers. Nowhere on any of the cited pages does the transcript mention anything about quantification of gross profits or foreclosure of MCED test developers. The proposed finding should therefore be disregarded.

However, as discussed above, Illumina is the only NGS sequencing provider that meets the requirements of MCED test developers. [redacted]

[redacted]

2. **Any Attempted Foreclosure Would Inflict Significant Reputational Harm on Illumina.**

853. Illumina has cultivated a reputation as a trusted supplier of NGS technology. (*See* PX7101 (Vogelstein (Johns Hopkins) Dep. at 57–58) ("Illumina makes fantastic instruments. I mean, they are unbelievably good . . . it's amazing what they've done.").)

Response to Finding No. 853

The proposed finding is irrelevant. Illumina's ability to make quality sequencers is irrelevant as to whether its customers "trust" them. The proposed finding is also misleading insofar it conflates "trusted supplier" with customers' trust in Illumina to do anything other than what will make Illumina the most money possible. Illumina is a public company whose goal is maximizing revenue for its shareholders above all else. [redacted]. When acquiring Grail, Mr. deSouza told

Illumina's investors that the acquisition will create more value for Illumina's shareholders than simply selling instruments and reagents to Grail. (CCFF ¶ 3094). As Complaint Counsel explains in its Post-Trial Reply Brief any reputational consequences will not mitigate Illumina's incentive to foreclose its rivals. First, Illumina already has a poor reputation among its customers; second, even if Illumina's reputation gets worse, it would have no impact on Illumina's upstream sales; and, third, Illumina insulated itself against any potential reputational damage through its Open Offer. (Complaint Counsel's Post-Trial Reply Brief at Section IV.).

Moreover, the weight of the evidence shows that Illumina's reputation among its customers is poor. [redacted] Illumina's customers agree. For example, Ariosa's former CEO, Mr. Song testified that Illumina is "kind of the big bully" and "people are scared of them." (PX7071 (Song (Omniome) IHT at 43-44)). [redacted]

[redacted]

Finally, Respondents have insulated themselves against any potential reputational damage by requiring *confidential* arbitration as the only enforcement mechanism for a breach of Illumina's commitments under the Open Offer. [redacted]

Therefore, this Court should disregard the proposed finding.

854. Illumina has developed its reputation by investing substantial amounts into innovation and dramatically lowering sequencing costs over time. (Aravanis (Illumina) Tr. 1922; (RX1100 (George (Invitae) Decl. ¶ 8).)

Response to Finding No. 854

The proposed finding is unsupported to the extent that neither of the cited sources make any reference to Illumina's general reputation in the market, or to any "substantial amounts" invested by Illumina. Complaint Counsel does not disagree that Illumina's reputation is that of the dominant provider of NGS services, and that the cost for gene sequencing has tended to decrease over time, particularly with the advent of NGS. (*See* CCFF ¶¶ 4-18; 892). The proposed finding is misleading, however, to the extent it implies that Illumina has a "good" reputation. To the contrary, the weight of the evidence shows that Illumina's reputation among its customers is poor. [redacted]

[redacted] Illumina's customers agree. For example, Ariosa's former CEO, Mr. Song testified that Illumina is "kind of the big bully" and "people are scared of them." (PX7071 (Song (Omniome) IHT at 43-44)). [redacted] Therefore, this Court should disregard the proposed finding.

855. Today, Illumina's brand is synonymous with innovative, low-cost sequencing systems. (*See* Berry (Illumina) Tr. 811–12.)

Response to Finding No. 855

The proposed finding is incomplete and misleading. It is also supported only by the self-serving testimony of an Illumina executive who benefits from building up the supposed "brand" of her employer.

The proposed finding is misleading insofar it suggests that Illumina's "brand" is somehow incompatible with the company's goal of making the most money possible. Illumina is a public company whose goal is maximizing revenue for its shareholders above all else. [redacted] When acquiring Grail, Mr. deSouza told Illumina's investors that the acquisition will create more value for Illumina's shareholders than simply selling instruments and reagents to Grail. (CCFF ¶

3094). Accordingly, it does not make business sense for Illumina to sacrifice potential revenue for the sake of upholding its alleged reputation as a "trusted supplier of NGS technology." Indeed, Illumina has already shown that it is willing to risk harm to its reputation to secure ownership of Grail and its future profits. Specifically, Illumina acknowledged that consummating the transaction during the pendency of the European Commission's review could lead to "other adverse consequences to, among other things, its reputation," but Illumina chose to do so anyway. (PX0378 at 005 (Illumina Form 8-K, Aug. 18, 2021); *see also* deSouza (Illumina) Tr. 2236-37 (stating that Illumina decided to close the transaction despite the potential risk to its reputation)).

Moreover, the weight of the evidence shows that Illumina's reputation among its customers is poor. [redacted] Illumina's customers agree. For example, Ariosa's former CEO, Mr. Song testified that Illumina is "kind of the big bully" and "people are scared of them." (PX7071 (Song (Omniome) IHT at 43-44)). [redacted] Therefore, this Court should disregard the proposed finding.

855.1 Since the release of its first Genome Analyzer instrument in 2007, Illumina has driven down sequencing costs from roughly $300,000 per gigabase to less

than $8 per gigabase today. (RX3515 (National Human Genome Research Institute Sequencing Costs Data) at 1; RX3864 (Carlton Expert Report) ¶ 77.)

Response to Finding No. 855.1

[redacted]

855.2 The phenomenon of dramatically declining sequencing costs is known in the industry as "Flatley's law", referring to Jay Flatley, Illumina's former CEO and Chairman. (*See* Berry (Illumina) Tr. 811–12 ("'Flatley's law' was a term coined by . . . a writer in Forbes magazine when he wrote an article comparing the reduction in the price of sequencing to Moore's law, which describes the reduction in the price of like silicon wafers or something in the computer industry, and [under Jay Flatley's] leadership where we really drove significant, significant reductions in the price of sequencing . . . down towards the level that they are today.").)

Response to Finding No. 855.2

The proposed finding is incomplete and misleading. It is also supported only by the self-serving testimony of an Illumina executive who benefits from building up the supposed "brand"

of her employer. Moreover, nothing about "Flatley's law" suggests that Illumina has passed on all reductions in the cost of sequencing to its customers. Because "more than 90% of the world's sequencing data is generated using Illumina NGS technology," Illumina can decide whether to lower its prices to customers commensurate with any reductions in sequencing costs that it achieves or decide to take higher profits. (CCFF ¶ 1020). [redacted]

The proposed finding is misleading insofar it suggests that "Flatley's law" is somehow incompatible with the company's goal of making the most money possible. Illumina is a public company whose goal is maximizing revenue for its shareholders above all else. [redacted] When acquiring Grail, Mr. deSouza told Illumina's investors that the acquisition will create more value for Illumina's shareholders than simply selling instruments and reagents to Grail. (CCFF ¶ 3094). Accordingly, it does not make business sense for Illumina to sacrifice potential revenue for the sake of upholding its alleged reputation as a "trusted supplier of NGS technology." Indeed, Illumina has already shown that it is willing to risk harm to its reputation to secure ownership of Grail and its future profits. Specifically, Illumina acknowledged that consummating the transaction during the pendency of the European Commission's review could lead to "other adverse consequences to, among other things, its reputation," but Illumina chose to do so anyway. (PX0378 at 005 (Illumina Form 8-K, Aug. 18, 2021); *see also* deSouza (Illumina) Tr.

2236-37 (stating that Illumina decided to close the transaction despite the potential risk to its reputation)).

Moreover, the weight of the evidence shows that Illumina's reputation among its customers is poor. [redacted] Illumina's customers agree. For example, Ariosa's former CEO, Mr. Song testified that Illumina is "kind of the big bully" and "people are scared of them." (PX7071 (Song (Omniome) IHT at 43-44)). [redacted] Therefore, this Court should disregard the proposed finding.

855.3 Reductions in sequencing costs have encouraged the development of entire industries that would not otherwise exist and for which Illumina is the primary supplier of sequencing inputs. (RX3864 (Carlton Expert Report) ¶ 77.)

Response to Finding No. 855.3

[redacted]

[redacted]

856. Both Illumina witnesses and third parties attested to Illumina's long-standing reputation for innovation and driving down sequencing costs.

Response to Finding No. 856

The proposed finding is completely unsupported by evidence and should be disregarded. It is also vague to the extent the terms "long-standing," "reputation," and "innovation" are undefined. Moreover, this unsupported contention is against the weight of the evidence as explained in Complaint Counsel's briefing.

856.1 In a sworn declaration to the FTC, an Illumina oncology customer (Invitae) stated that "Illumina's role as an innovator in NGS has moved the field forward tremendously, as they have constantly and steadily reduced sequencing costs over time." (RX1100 (George (Invitae) Decl. ¶ 8).)

Response to Finding No. 856.1

The proposed finding is incomplete and misleading. Nothing about the cited quote suggests that Illumina has passed on all reductions in the cost of sequencing to its customers. Because "more than 90% of the world's sequencing data is generated using Illumina NGS technology," Illumina can decide whether to lower its prices to customers commensurate with any reductions in sequencing costs that it achieves or decide to take higher profits. (CCFF ¶ 1020). [redacted]

The proposed finding is misleading insofar it suggests that "Illumina's role as an innovator" is somehow incompatible with the company's goal of making the most money

possible. Illumina is a public company whose goal is maximizing revenue for its shareholders above all else. [redacted] When acquiring Grail, Mr. deSouza told Illumina's investors that the acquisition will create more value for Illumina's shareholders than simply selling instruments and reagents to Grail. (CCFF ¶ 3094). Accordingly, it does not make business sense for Illumina to sacrifice potential revenue for the sake of upholding its alleged reputation as a "trusted supplier of NGS technology." Indeed, Illumina has already shown that it is willing to risk harm to its reputation to secure ownership of Grail and its future profits. Specifically, Illumina acknowledged that consummating the transaction during the pendency of the European Commission's review could lead to "other adverse consequences to, among other things, its reputation," but Illumina chose to do so anyway. (PX0378 at 005 (Illumina Form 8-K, Aug. 18, 2021); *see also* deSouza (Illumina) Tr. 2236-37 (stating that Illumina decided to close the transaction despite the potential risk to its reputation)).

Moreover, the weight of the evidence shows that Illumina's reputation among its customers is poor. [redacted] Illumina's customers agree. For example, Ariosa's former CEO, Mr. Song testified that Illumina is "kind of the big bully" and "people are scared of them." (PX7071 (Song (Omniome) IHT at 43-44)). [redacted]

[redacted] Therefore, this Court should disregard the proposed finding.

856.2 Gary Gao of Singlera testified that Singlera is "very happy Illumina has paved the way for NGS" and that he credited "the Illumina team for leading a genome revolution". (PX7102 (Gao (Singlera) Dep. at 70).)

Response to Finding No. 856.2

The proposed finding is irrelevant as to whether Illumina will have the ability and incentive to foreclose Grail's rivals. Illumina can both build a good NGS sequencer and have the ability and incentive to foreclose Grail's rivals. The proposed finding is incomplete and misleading insofar as it suggests that Dr. Gao is completely satisfied in his dealings with Illumina. Dr. Gao testified at trial that Illumina is the "800-pound" gorilla as "Illumina control[s] the supply chain for all the NGS-based early cancer detection technology, not only for Singlera, but for other companies." (Gao (Singlera) Tr. 2947-48; *see also* PX7042 (Gao (Singlera) IHT) at 88 (describing Singlera's relationship with Illumina as like being a "prisoner of war")).

The proposed finding is also misleading because Illumina is a public company whose goal is maximizing revenue for its shareholders above all else. [redacted] When acquiring Grail, Mr. deSouza told Illumina's investors that the acquisition will create more value for Illumina's shareholders than simply selling instruments and reagents to Grail. (CCFF ¶ 3094). Accordingly, it does not make

business sense for Illumina to sacrifice potential revenue for the sake of upholding its alleged reputation as a "trusted supplier of NGS technology." Indeed, Illumina has already shown that it is willing to risk harm to its reputation to secure ownership of Grail and its future profits. Specifically, Illumina acknowledged that consummating the transaction during the pendency of the European Commission's review could lead to "other adverse consequences to, among other things, its reputation," but Illumina chose to do so anyway. (PX0378 at 005 (Illumina Form 8-K, Aug. 18, 2021); *see also* deSouza (Illumina) Tr. 2236-37 (stating that Illumina decided to close the transaction despite the potential risk to its reputation)).

Moreover, the weight of the evidence shows that Illumina's reputation among its customers is poor. [redacted] Illumina's customers agree. For example, Ariosa's former CEO, Mr. Song testified that Illumina is "kind of the big bully" and "people are scared of them." (PX7071 (Song (Omniome) IHT at 43-44)). [redacted] Therefore, this Court should disregard the proposed finding.

856.3 Ms. Berry explained that Illumina routinely measures its reputation using "net promoter score" customer surveys, a widely-used survey methodology, and frequently receives "very high Net Promoter Scores relative to industry benchmarks." (Berry (Illumina) Tr. 837–38.)

Response to Finding No. 856.3

The proposed finding is vague, incomplete, and misleading. It is vague because it is unclear what "net promoter score" customer surveys are or what is contained in such surveys. The significance of "very high Net Promoter Scores relative to industry benchmarks" is also unclear from the cited quote. The proposed finding is also supported only by the self-serving testimony of an Illumina executive who benefits from building up the supposed "brand" of her employer.

The proposed finding is misleading because Illumina is a public company whose goal is maximizing revenue for its shareholders above all else. [redacted] When acquiring Grail, Mr. deSouza told Illumina's investors that the acquisition will create more value for Illumina's shareholders than simply selling instruments and reagents to Grail. (CCFF ¶ 3094). Accordingly, it does not make business sense for Illumina to sacrifice potential revenue for the sake of upholding its alleged reputation as a "trusted supplier of NGS technology." Indeed, Illumina has already shown that it is willing to risk harm to its reputation to secure ownership of Grail and its future profits. Specifically, Illumina acknowledged that consummating the transaction during the pendency of the European Commission's review could lead to "other adverse consequences to, among other things, its reputation," but Illumina chose to do so anyway. (PX0378 at 005 (Illumina Form 8-K, Aug. 18, 2021); *see also* deSouza (Illumina) Tr. 2236-37 (stating that Illumina decided to close the transaction despite the potential risk to its reputation)).

Moreover, the weight of the evidence shows that Illumina's reputation among its

customers is poor. [redacted] Illumina's customers agree. For example, Ariosa's former CEO, Mr. Song testified that Illumina is "kind of the big bully" and "people are scared of them." (PX7071 (Song (Omniome) IHT at 43-44)). [redacted] Therefore, this Court should disregard the proposed finding.

857. Illumina's reputation for NGS innovation and lowering sequencing costs is critical to the continued success of its NGS business and overall profitability:

Response to Finding No. 857

The proposed finding is completely unsupported by evidence and should be disregarded. It is also vague to the extent the terms "reputation," and "critical to the continued success" are undefined. Moreover, Respondents' unsupported contention is against the weight of the evidence for all the reasons explained in Complaint Counsel's post-trial briefing.

857.1 Illumina's profits from clinical applications are largely in the future. (S*ee* deSouza (Illumina) Tr. 2326–27 ("even with all the progress we've made in the last . . . almost two decades since the first human genome, today we still understand very little of how your genome translates into health and disease states. . . . There is a lot of research going on in that area, and once the researchers uncover the connections between your genome and those conditions, we'll start to see clinical applications emerge to do the testing based on that finding. . . . [W]e have so much undiscovered in front of us. As we discover that, I have no doubt we will see a lot more clinical applications emerge in the future."); Aravanis (Illumina) Tr. 1842–43 (NGS is still in the "early days" as a "tool for clinical diagnostics", and there are "many new applications emerging, and some of those

could be even bigger than the ones we have today"—it is "still early in seeing how [NGS] can benefit medicine.").)

Response to Finding No. 857.1

The proposed finding is incomplete and misleading. [redacted]

[redacted]

857.2 Illumina relies on its customers to invest in costly R&D to generate demand for Illumina's products, including in applications that have not yet been developed or possibly even conceived, creating a future stream of sequencing sales and profits. (*See, e.g.*, Berry (Illumina) Tr. 811 ("Our mission remains to . . . enable all attributes of our technology to drive accessibility and utilization across as many use cases as possible, and certainly pricing is a key element of that, a key enabler of that, and so continuing to drive down the price of sequencing is something that we are absolutely relentlessly continuing to pursue."); [redacted]

Response to Finding No. 857.2

[redacted]

[redacted]

[redacted]

857.3 To realize those future profits, Illumina must incentivize customers to invest, which requires that Illumina maintain its reputation as a supporter of innovation by its customers in products that use Illumina's NGS technology. (RX6000 (Carlton Trial Dep. at 33–35, 186, 188).)

Response to Finding No. 857.3

The proposed finding is vague, incomplete, and misleading. It is vague because it does

not define "those future profits" or specify which "customers" it is referring to. The proposed finding is incomplete and misleading because it does not account for the change in Illumina's incentives after acquiring Grail. Illumina spun out Grail "to encourage investment into many different NGS-based companies focused on early cancer detection to have as many shots on goal as possible." (PX2561 (Illumina) at 017 (Email from J. Cunningham, Illumina, to F. deSouza, Illumina, attaching "DRAFT Sands Investor Talking Points," Oct. 30, 2020); deSouza (Illumina) Tr. 2204-5).

Moreover, the proposed finding is incomplete and misleading insofar as it assumes that any actions that Illumina takes to foreclose Grail's MCED test developer rivals will have a negative impact on its reputation. For example, if customers are able to discover a potential breach by Illumina of the Open Offer, the Open Offer explicitly provides that they must submit the matter to "confidential binding arbitration." (*see* PX0064 at 008). Because enforcement of the Open Offer is confidential, other customers and industry participants would not learn of the breach. Thus, Illumina ensured, through its unilaterally imposed contractual terms, that its reputation cannot be harmed if it breaches the Open Offer. In addition, Illumina can breach the

Open Offer in subtle ways that will likely go undetected. [redacted]

857.4 [redacted]

Response to Finding No. 857.4

[redacted]

857.5 Illumina cannot predict which of its customers will create the next breakthrough product that will greatly expand the adoption of NGS. (RX6000 (Carlton Trial Dep. at 33–35, 186, 188).)

Response to Finding No. 857.5

The proposed finding is vague, incomplete, and misleading. It is vague because it does not define "breakthrough product" or what it means to "greatly expand the adoption of NGS." It is incomplete and misleading to the extent that it is referring to MCED test developers because it does not account for the change in Illumina's incentives after acquiring Grail. Illumina spun out Grail "to encourage investment into many different NGS-based companies focused on early cancer detection to have as many shots on goal as possible." (PX2561 (Illumina) at 017 (Email from J. Cunningham, Illumina, to F. deSouza, Illumina, attaching "DRAFT Sands Investor Talking Points," Oct. 30, 2020); deSouza (Illumina) Tr. 2204-5). [redacted]

[redacted]

Moreover, the proposed finding is incomplete and misleading insofar as it assumes that any actions that Illumina takes to foreclose Grail's MCED test developer rivals will have a negative impact on its reputation. For example, if customers are able to discover a potential breach by Illumina of the Open Offer, the Open Offer explicitly provides that they must submit the matter to "confidential binding arbitration." (*see* PX0064 at 008). Because enforcement of the Open Offer is confidential, other customers and industry participants would not learn of the breach. Thus, Illumina ensured, through its unilaterally imposed contractual terms, that its reputation cannot be harmed if it breaches the Open Offer. In addition, Illumina can breach the Open Offer in subtle ways that will likely go undetected. [redacted]

[redacted]

857.6 The future uses for Illumina's sequencing inputs are unknown and future demand for Illumina's sequencing inputs depends on downstream firms' willingness to invest in costly and uncertain R&D efforts using the Illumina sequencing platforms. [redacted]; PX7065 (Aravanis (Illumina) IHT at 143–44); [redacted]

Response to Finding No. 857.6

[redacted]

[redacted]

857.7 Illumina thus has the incentive to support all of its customers even where foreclosure could theoretically result in short term gain. (RX6000 (Carlton Trial Dep. at 33–35, 186, 188).)

Response to Finding No. 857.7

The proposed finding is vague, incomplete, and misleading. It is vague because it does not define "short term gain." It is incomplete and misleading to the extent that it is referring to MCED test developers because it does not account for the change in Illumina's incentives after acquiring Grail. Illumina spun out Grail "to encourage investment into many different NGS-based companies focused on early cancer detection to have as many shots on goal as possible." (PX2561 (Illumina) at 017 (Email from J. Cunningham, Illumina, to F. deSouza, Illumina, attaching "DRAFT Sands Investor Talking Points," Oct. 30, 2020); deSouza (Illumina) Tr. 2204-5). [redacted]

[redacted]

Moreover, the proposed finding is incomplete and misleading insofar as it assumes that any actions that Illumina takes to foreclose Grail's MCED test developer rivals will have a negative impact on its reputation. For example, if customers are able to discover a potential breach by Illumina of the Open Offer, the Open Offer explicitly provides that they must submit the matter to "confidential binding arbitration." (*see* PX0064 at 008). Because enforcement of the Open Offer is confidential, other customers and industry participants would not learn of the breach. Thus, Illumina ensured, through its unilaterally imposed contractual terms, that its reputation cannot be harmed if it breaches the Open Offer. In addition, Illumina can breach the Open Offer in subtle ways that will likely go undetected. [redacted]

857.8 [redacted]

Response to Finding No. 857.8

[redacted]

858. If Illumina attempted to foreclose cancer screening test developers, its reputation would change from a supporter of clinical development on its platforms to a supplier willing to engage in opportunistic hold-up when the applications it encourages customers to develop reach scale and profitability. (Aravanis (Illumina) Tr. 1922–23, 1931–32; Febbo (Illumina) Tr. 4331–32; [redacted]

Response to Finding No. 858

[redacted]

[redacted]

[redacted]

[redacted]

859. Such a reputation would damage Illumina's NGS business and its expectation of future profits from the expansion of NGS-based clinical testing. (Aravanis (Illumina) Tr. 1922–23, 1931–32; Febbo (Illumina) Tr. 4331–32; deSouza (Illumina) Tr. 2379–80.)

Response to Finding No. 859

The proposed finding is incomplete, misleading, and against the weight of the evidence. The proposed finding is also vague as "such a reputation" is undefined. It also relies on the self-serving testimony of Illumina executives, Dr. Aravanis, Dr. Febbo, and Mr. deSouza, who benefit from claiming that their employer has a reputation as a supporter of clinical development.

The proposed finding is incomplete and misleading insofar as it assumes that any actions that Illumina takes to foreclose Grail's MCED test developer rivals will have a negative impact on its reputation. For example, if customers are able to discover a potential breach by Illumina of the Open Offer, the Open Offer explicitly provides that they must submit the matter to "confidential binding arbitration." (*see* PX0064 at 008). Because enforcement of the Open Offer is confidential, other customers and industry participants would not learn of the breach. Thus, Illumina ensured, through its unilaterally imposed contractual terms, that its reputation cannot be harmed if it breaches the Open Offer. In addition, Illumina can breach the Open Offer in subtle ways that will likely go undetected. [redacted]

Moreover, the weight of the evidence shows that Illumina's reputation among its

customers is poor. [redacted] Illumina's customers agree. For example, Ariosa's former CEO, Mr. Song testified that Illumina is "kind of the big bully" and "people are scared of them." (PX7071 (Song (Omniome) IHT at 43-44)). [redacted]

Additionally, the proposed finding is misleading because Illumina's reputation matters less for MCED test developers because MCED customers have nowhere else to go. [redacted] Singlera's Mr. Gao testified at trial that Illumina is the "800-pound" gorilla as "Illumina control[s] the supply chain for all the NGS-based early cancer detection technology, not only for Singlera, but for other companies." (Gao (Singlera) Tr. 2947-48; *see also* PX7042 (Gao (Singlera) IHT) at 88 (describing Singlera's relationship with Illumina as like being a "prisoner of war")).

Lastly, the proposed finding is incomplete and misleading because Illumina has already shown that it is willing to risk harm to its reputation to secure ownership of Grail and its future profits. Specifically, Illumina acknowledged that consummating the transaction during the pendency of the European Commission's review could lead to "other adverse consequences to, among other things, its reputation," but Illumina chose to do so anyway. (PX0378 at 005 (Illumina Form 8-K, Aug. 18, 2021); *see also* deSouza (Illumina) Tr. 2236-37 (stating that Illumina decided to close the transaction despite the potential risk to its reputation)). Therefore, this Court should disregard the proposed finding.

860. Many innovators would choose not to invest in developing emerging and future applications using Illumina's platforms—not just limited to cancer screening—opting instead to pursue such applications on rival upstream platforms, or not at all. (Aravanis (Illumina) Tr. 1922–23, 1931–32; Febbo (Illumina) Tr. 4331–32; deSouza (Illumina) Tr. 2379–80; [redacted]

Response to Finding No. 860

[redacted]

[redacted]

[redacted]

861. This in turn would stunt the growth and expansion of Illumina's NGS products to new applications and diminish Illumina's future sales in markets in which GRAIL is not active, making recoupment of those lost sales impossible. (Aravanis (Illumina) Tr. 1922–23, 1931–32; Febbo (Illumina) Tr. 4331–32; deSouza (Illumina) Tr. 2379–80; [redacted]

Response to Finding No. 861

[redacted]

[redacted]

[redacted]

[redacted]

862. Raising price to disadvantage clinical oncology test developers would thus substantially harm the growth of Illumina's core business. (RX3864 (Carlton Expert Report) ¶ 86).

Response to Finding No. 862

[redacted]

[redacted]

863. The reputational damage from an attempted foreclosure strategy would also harm Illumina by making it difficult to attract and retain the best scientists and innovators. (Aravanis (Illumina) Tr. 1922–23, 1931–32 (explaining that "many employees come to Illumina because of our culture and our values" and "impeding innovation would be counter to that" and make it difficult to "retain[] the talent we have and attract[] new people who want to work on developing new sequencing technology applications.").)

Response to Finding No. 863

The proposed finding is vague, incomplete, misleading, and against the weight of the evidence. It is vague because it does not describe what Illumina's "culture" and "values" are. It is unclear why an attempted foreclosure strategy against Grail's MCED rivals would result in the inability to retain and attract top talent, particularly if that talent is not even aware of such a strategy. It also relies on the self-serving testimony of an Illumina executive, Dr. Aravanis, who benefits from claiming that his employer has a reputation as a supporter of clinical development.

The proposed finding is incomplete and misleading insofar as it assumes that any actions that Illumina takes to foreclose Grail's MCED test developer rivals will have a negative impact on its reputation. For example, if customers are able to discover a potential breach by Illumina of the Open Offer, the Open Offer explicitly provides that they must submit the matter to "confidential binding arbitration." (*see* PX0064 at 008). Because enforcement of the Open Offer is confidential, other customers and industry participants would not learn of the breach. Thus, Illumina ensured, through its unilaterally imposed contractual terms, that its reputation cannot be harmed if it breaches the Open Offer. In addition, Illumina can breach the Open Offer in subtle ways that will likely go undetected. [redacted]

[redacted]

[redacted]

Moreover, the weight of the evidence shows that Illumina's reputation among its customers is poor. [redacted] Illumina's customers agree. For example, Ariosa's former CEO, Mr. Song testified that Illumina is "kind of the big bully" and "people are scared of them." (PX7071 (Song (Omniome) IHT at 43-44)). [redacted]

Additionally, the proposed finding is misleading because Illumina's reputation matters less for MCED test developers because MCED customers have nowhere else to go. [redacted]

[redacted] Singlera's Mr. Gao testified at trial that Illumina is the "800-pound" gorilla as "Illumina control[s] the supply chain for all the NGS-based early cancer detection technology, not only for Singlera, but for other companies." (Gao (Singlera) Tr. 2947-48; *see also* PX7042 (Gao (Singlera) IHT) at 88 (describing Singlera's relationship with Illumina as like being a "prisoner of war")).

Lastly, the proposed finding is incomplete and misleading because Illumina has already shown that it is willing to risk harm to its reputation to secure ownership of Grail and its future profits. Specifically, Illumina acknowledged that consummating the transaction during the pendency of the European Commission's review could lead to "other adverse consequences to, among other things, its reputation," but Illumina chose to do so anyway. (PX0378 at 005 (Illumina Form 8-K, Aug. 18, 2021); *see also* deSouza (Illumina) Tr. 2236-37 (stating that Illumina decided to close the transaction despite the potential risk to its reputation)). Therefore, this Court should disregard the proposed finding.

864. Illumina's witnesses offered uncontested evidence an attempted foreclosure strategy would harm Illumina's reputation and, in turn, Illumina's future NGS growth and profitability:

Response to Finding No. 864

[redacted]

[redacted]

The proposed finding is also incorrect regarding the "uncontested" evidence about harm to Illumina's reputation. Substantial evidence has been submitted showing that Illumina may not suffer any harm to its reputation from a foreclosure strategy. For example, if customers are able to discover a potential breach by Illumina of the Open Offer, the Open Offer explicitly provides that they must submit the matter to "confidential binding arbitration." (*see* PX0064 at 008). Because enforcement of the Open Offer is confidential, other customers and industry participants would not learn of the breach. Thus, Illumina ensured, through its unilaterally imposed contractual terms, that its reputation cannot be harmed if it breaches the Open Offer. In addition, Illumina can breach the Open Offer in subtle ways that will likely go undetected. [redacted]

[redacted]

Moreover, the weight of the evidence shows that Illumina's reputation among its customers is poor. [redacted] Illumina's customers agree. For example, [redacted].

Additionally, the proposed finding is misleading because Illumina's reputation matters less for MCED test developers because MCED customers have nowhere else to go. [redacted] Singlera's

Mr. Gao testified at trial that Illumina is the "800-pound" gorilla as "Illumina control[s] the supply chain for all the NGS-based early cancer detection technology, not only for Singlera, but for other companies." (Gao (Singlera) Tr. 2947-48; *see also* PX7042 (Gao (Singlera) IHT) at 88 (describing Singlera's relationship with Illumina as like being a "prisoner of war")). Therefore, this Court should disregard the proposed finding.

> 864.1 As Dr. Aravanis explained, attempting to foreclose a GRAIL rival "would be very detrimental" because "our business is based on customers using our platforms for their applications, developing new applications" and "[w]ere we to do something like foreclose on a customer's business . . . we would jeopardize the existing customer relationships", and "at a kind of reputational level, to do something like that . . . is not consistent with our mission and values." (Aravanis (Illumina) Tr. 1922–23; 1931–32.)

Response to Finding No. 864.1

The proposed finding is vague, incomplete, misleading, and against the weight of the evidence. It is vague because it does not describe Illumina's "mission" or "values" and why they would prevent them from doing something if it was a way to maximize profits. It also relies on the self-serving testimony of an Illumina executives, Dr. Aravanis, who benefit from claiming that his employer has a reputation as a supporter of clinical development.

The proposed finding is incomplete and misleading insofar as it assumes that any actions that Illumina takes to foreclose Grail's MCED test developer rivals will have a negative impact on its reputation. For example, if customers are able to discover a potential breach by Illumina of the Open Offer, the Open Offer explicitly provides that they must submit the matter to "confidential binding arbitration." (*see* PX0064 at 008). Because enforcement of the Open Offer is confidential, other customers and industry participants would not learn of the breach. Thus, Illumina ensured, through its unilaterally imposed contractual terms, that its reputation cannot be harmed if it breaches the Open Offer. In addition, Illumina can breach the Open Offer in subtle ways that will likely go undetected. [redacted]

[redacted]

Moreover, the weight of the evidence shows that Illumina's reputation among its customers is poor. [redacted] Illumina's customers agree. [redacted]

Additionally, the proposed finding is misleading because Illumina's reputation matters less for MCED test developers because MCED customers have nowhere else to go. [redacted]

[redacted] Singlera's Mr. Gao testified at trial that Illumina is the "800-pound" gorilla as "Illumina control[s] the supply chain for all the NGS-based early cancer detection technology, not only for Singlera, but for other companies." (Gao (Singlera) Tr. 2947-48; *see also* PX7042 (Gao (Singlera) IHT) at 88 (describing Singlera's relationship with Illumina as like being a "prisoner of war")).

Lastly, the proposed finding is incomplete and misleading because Illumina has already shown that it is willing to risk harm to its reputation to secure ownership of Grail and its future profits. Specifically, Illumina acknowledged that consummating the transaction during the pendency of the European Commission's review could lead to "other adverse consequences to, among other things, its reputation," but Illumina chose to do so anyway. (PX0378 at 005 (Illumina Form 8-K, Aug. 18, 2021); *see also* deSouza (Illumina) Tr. 2236-37 (stating that Illumina decided to close the transaction despite the potential risk to its reputation)). Therefore, this Court should disregard the proposed finding.

> 864.2 Dr. Febbo explained: "[I]f we were to behave in a way that precluded competition or in a way that disincentivized groups to use our sequencing [in] screening, that would disincentivize other companies, laboratories from early research and development through the development of clinical tests from using our platform and, thus, it is in our best interest to make sure that we continue to create an environment where laboratories are excited to use our platform to develop screening tests for cancer, as well as all the other applications we see happening." (Febbo (Illumina) Tr. 4331–32.)

Response to Finding No. 864.2

The proposed finding is vague, incomplete, misleading, and against the weight of the evidence. It is vague because it does not describe what it means to "behave in a way that precluded competition" or "create an environment where laboratories are excited to use our platform." As discussed below, MCED test developers are required to use Illumina's platforms

for their tests, whether they are excited to do so or not. The finding also relies on the self-serving testimony of an Illumina executive, Dr. Febbo, who benefits from claiming that his employer has a reputation as a supporter of clinical development.

The proposed finding is incomplete and misleading insofar as it assumes that any actions that Illumina takes to foreclose Grail's MCED test developer rivals will have a negative impact on its reputation. For example, if customers are able to discover a potential breach by Illumina of the Open Offer, the Open Offer explicitly provides that they must submit the matter to "confidential binding arbitration." (*see* PX0064 at 008). Because enforcement of the Open Offer is confidential, other customers and industry participants would not learn of the breach. Thus, Illumina ensured, through its unilaterally imposed contractual terms, that its reputation cannot be harmed if it breaches the Open Offer. In addition, Illumina can breach the Open Offer in subtle ways that will likely go undetected. [redacted]

Moreover, the weight of the evidence shows that Illumina's reputation among its customers is poor. [redacted]

[redacted] Illumina's customers agree. [redacted]

Additionally, the proposed finding is misleading because Illumina's reputation matters less for MCED test developers because MCED customers have nowhere else to go. [redacted] Singlera's Mr. Gao testified at trial that Illumina is the "800-pound" gorilla as "Illumina control[s] the supply chain for all the NGS-based early cancer detection technology, not only for Singlera, but for other companies." (Gao (Singlera) Tr. 2947-48; *see also* PX7042 (Gao (Singlera) IHT) at 88 (describing Singlera's relationship with Illumina as like being a "prisoner of war")).

Lastly, the proposed finding is incomplete and misleading because Illumina has already shown that it is willing to risk harm to its reputation to secure ownership of Grail and its future profits. Specifically, Illumina acknowledged that consummating the transaction during the pendency of the European Commission's review could lead to "other adverse consequences to,

among other things, its reputation," but Illumina chose to do so anyway. (PX0378 at 005 (Illumina Form 8-K, Aug. 18, 2021); *see also* deSouza (Illumina) Tr. 2236-37 (stating that Illumina decided to close the transaction despite the potential risk to its reputation)). Therefore, this Court should disregard the proposed finding.

> 864.3 Mr. deSouza explained: "[I]f people heard that we were raising costs in a market, I mean, that would cause us to have a ripple effect of losses in our sequencer business, not just in the cancer screening market, not just in the oncology market, but across our customer base as a whole." (deSouza (Illumina) Tr. 2386–87) Mr. deSouza further noted that the reason it is "very important for us that our customers . . . recognize that we are the company that drives the cost of sequencing down at high quality and makes sequencing more accessible" is because we would lose their business. They would move on to, you know, a BGI or a Thermo", and for Illumina it is important to remain known as the company "that drives prices down" and "encourages an ecosystem even in markets where we have a test." (deSouza (Illumina) Tr. 2379–80.)

Response to Finding No. 864.3

The proposed finding is vague, incomplete, misleading, and against the weight of the evidence. It is vague because it does not specify which customers Illumina may lose revenue from. It is misleading because Illumina need not raise costs for its customers across the board in order to raise costs (or otherwise foreclose) MCED test developers. Illumina has the ability to identify and discriminate against MCED test developers posing competitive threats to Grail's Galleri test. [redacted] It also relies on the self-serving testimony of an Illumina executive, Mr. deSouza, who benefits from claiming that his employer has a reputation as a supporter of clinical development.

It is also misleading because, for MCED testing, Illumina is the only NGS sequencing provider that meets the requirements of MCED test developers. [redacted]

[redacted]

The proposed finding is incomplete and misleading insofar as it assumes that any actions that Illumina takes to foreclose Grail's MCED test developer rivals will have a negative impact on its reputation. For example, if customers are able to discover a potential breach by Illumina of the Open Offer, the Open Offer explicitly provides that they must submit the matter to "confidential binding arbitration." (*see* PX0064 at 008). Because enforcement of the Open Offer is confidential, other customers and industry participants would not learn of the breach. Thus, Illumina ensured, through its unilaterally imposed contractual terms, that its reputation cannot be harmed if it breaches the Open Offer. In addition, Illumina can breach the Open Offer in subtle ways that will likely go undetected. [redacted]

Moreover, the weight of the evidence shows that Illumina's reputation among its

customers is poor. [redacted]

Additionally, the proposed finding is misleading because Illumina's reputation matters less for MCED test developers because MCED customers have nowhere else to go. [redacted] Singlera's Mr. Gao testified at trial that Illumina is the "800-pound" gorilla as "Illumina control[s] the supply chain for all the NGS-based early cancer detection technology, not only for Singlera, but for other companies." (Gao (Singlera) Tr. 2947-48; *see also* PX7042 (Gao (Singlera) IHT) at 88 (describing Singlera's relationship with Illumina as like being a "prisoner of war")).

Lastly, the proposed finding is incomplete and misleading because Illumina has already shown that it is willing to risk harm to its reputation to secure ownership of Grail and its future profits. Specifically, Illumina acknowledged that consummating the transaction during the pendency of the European Commission's review could lead to "other adverse consequences to, among other things, its reputation," but Illumina chose to do so anyway. (PX0378 at 005 (Illumina Form 8-K, Aug. 18, 2021); *see also* deSouza (Illumina) Tr. 2236-37 (stating that Illumina decided to close the transaction despite the potential risk to its reputation)). Therefore, this Court should disregard the proposed finding.

865. Complaint Counsel suggested that Illumina's reputation is not valuable to Illumina because, in its SEC disclosures, Illumina noted that its decision to close the Transaction could have potentially adverse consequences to Illumina's reputation; however, Mr. deSouza explained that, although there was *a risk* of reputational harm that had to be disclosed, Illumina believed that "once people hear what we did . . . there won't be damage to our reputation" given the reasons for closing and the impact of the Transaction on cancer care and saving lives. (deSouza (Illumina) Tr. 2236–37, 2340.)

Response to Finding No. 865

The proposed finding is vague, internally inconsistent, confusing, and misleading. Mr. deSouza claims that Illumina has been "very transparent with investors, you know, with our customers about, you know, why we – why we felt we had to do what we did." (deSouza (Illumina) Tr. 2340). Yet, despite this supposed transparency, Mr. deSouza reported to the SEC a risk of reputational harm from closing the transaction over the standstill obligation of the European Commission. He defended this action after the fact by saying that there will not actually be damage to Illumina's reputation "once people hear what we did." These actions and statements are at odds with each other. Mr. deSouza was either not transparent with his investors and customers, not forthright with the SEC in disclosing a risk of reputational harm, or not forthright with this Court when he said that he does not believe there will be damage to Illumina's reputation. If Mr. deSouza was transparent with investors and customers, then they

would already know "what Illumina did," and, according to Mr. deSouza, would support Illumina's decision to close the Transaction. Thus, there would be no need to mention a risk of reputational harm to the SEC. But Illumina did so anyway, illustrating that Illumina is willing to proceed with actions that it perceives as beneficial regardless of the potential for others (such as their customers) to disagree. It is unclear what else Mr. deSouza had in mind to notify "people" of "what Illumina did" so that those "people" would not perceive Illumina to have done something that is inconsistent with Illumina's "mission and values." [redacted]

The proposed finding is incomplete and misleading insofar as it assumes that any actions that Illumina takes to foreclose Grail's MCED test developer rivals will have a negative impact on its reputation. For example, if customers are able to discover a potential breach by Illumina of the Open Offer, the Open Offer explicitly provides that they must submit the matter to "confidential binding arbitration." (*see* PX0064 at 008). Because enforcement of the Open Offer is confidential, other customers and industry participants would not learn of the breach. Thus, Illumina ensured, through its unilaterally imposed contractual terms, that its reputation cannot be harmed if it breaches the Open Offer. In addition, Illumina can breach the Open Offer in subtle ways that will likely go undetected. [redacted]

Moreover, the weight of the evidence shows that Illumina's reputation among its

customers is poor. [redacted]

Additionally, the proposed finding is misleading because Illumina's reputation matters less for MCED test developers because MCED customers have nowhere else to go. [redacted] Therefore,

this Court should disregard the proposed finding.

> 865.1 In other words, Mr. deSouza, and Illumina, believe that closing the Transaction will *in fact* have a positive impact on Illumina's reputation. (deSouza (Illumina) Tr. 2236–37, 2340.)

Response to Finding No. 865.1

The proposed finding is vague, internally inconsistent, confusing, and misleading. If Mr. deSouza, and Illumina, believe that closing the Transaction will have a positive impact on Illumina's reputation, then it is unclear why they would include a risk of reputational harm in the SEC disclosure. In other words, it is unclear why Illumina and Mr. deSouza would indicate a potential risk to investors in a regulatory filing but tell this Court that they in fact thought the opposite – that there would actually be a benefit to Illumina's reputation. Further, to the extent that Illumina and Mr. deSouza believed that closing the transaction posed a risk to their reputation, it is unclear *why* they believed it would pose such a risk. Based on Mr. deSouza's testimony at trial, he appears to believe that "people" would initially consider it to be inconsistent with Illumina's "mission and values" to ignore the obligations placed on it by a governmental entity. But, according to Mr. deSouza, once those "people" realized that the Grail transaction is "really important," they would change their mind and think the opposite. (deSouza (Illumina) Tr. 2340). It is unclear why such "people" would change their minds when informed of the "importance" of the Transaction. Therefore, this Court should disregard the proposed finding.

> 865.2 There is nothing in the SEC disclosure that suggests that closing the Transaction would harm Illumina's reputation for lowering costs and innovating to encourage development on its platforms. (deSouza (Illumina) Tr. 2236–37, 2340.)

Response to Finding No. 865.2

The proposed finding is incorrect. There is a statement in the SEC disclosure that lists one of the "[i]mportant risk factors" of closing the Transaction as "the possibility of other

adverse consequences to, among other things, Illumina's reputation…" (PX0378 at 005 (Illumina Form 8-K, Aug. 18, 2021)). This suggests that closing the Transaction could harm Illumina's reputation. The SEC disclosure does not specify what Illumina's reputation is, but multiple Illumina executives testified that they believe that Illumina has a reputation for lowering costs and innovating to encourage development on its platforms. [redacted] Therefore, if Illumina's executives are correct about Illumina's reputation (and many MCED customers believe that they are not), then the SEC disclosure clearly contains a statement suggesting that its reputation would be harmed by closing the Transaction. This Court should disregard the proposed finding.

866. From an economic perspective, it is critical to consider a firm's reputation in analyzing that firm's incentives and ability to foreclose its customers following vertical integration. (RX6000 (Carlton Trial Dep. at 25).)

Response to Finding No. 866

The proposed finding is vague, incomplete, and misleading. It is vague because it is unclear what Respondents mean by "from an economic perspective." The proposed finding is misleading and incomplete because, as discussed above, reputational concerns matter more to some firms than others. Illumina acknowledged that consummating the transaction during the pendency of the European Commission's review could lead to "other adverse consequences to, among other things, its reputation," but Illumina chose to do so anyway. (PX0378 at 005 (Illumina Form 8-K, Aug. 18, 2021); *see also* deSouza (Illumina) Tr. 2236-37 (stating that Illumina decided to close the transaction despite the potential risk to its reputation)).

It is also misleading because if firms are unaware that Illumina is foreclosing on rivals, then Illumina will not suffer any reputational harm. For example, if customers are able to discover a potential breach by Illumina of the Open Offer, the Open Offer explicitly provides that they must submit the matter to "confidential binding arbitration." (*see* PX0064 at 008).

Because enforcement of the Open Offer is confidential, other customers and industry participants would not learn of the breach. Thus, Illumina ensured, through its unilaterally imposed contractual terms, that its reputation cannot be harmed if it breaches the Open Offer. In addition, Illumina can breach the Open Offer in subtle ways that will likely go undetected. [redacted]

866.1 [redacted]

Response to Finding No. 866.1

[redacted]

[redacted]

866.2 Illumina's reputation constrains its incentive and ability to foreclose any GRAIL rival, because Illumina's customers are "investing large amounts of money right now in the hopes of having profitable products in the future", but "[i]f Illumina got a reputation for either jacking up price when someone's successful or harming them in some other way, that would have implications for the willingness of customers to continue to do business with Illumina as they're doing now." (RX6000 (Carlton Trial Dep. at 33–34).)

Response to Finding No. 866.2

The proposed finding is misleading and incomplete. The proposed finding is misleading to the extent it suggests that Illumina's customers have alternative sequencing alternatives on which to develop its products. As explained extensively in Complaint Counsel's post-trial briefing, for many applications that is simply not true. Further, to the extent that customers do become aware of Illumina's actions, Illumina may only develop a reputation as a company that disadvantages companies once they start competing with them, which is a reputation that Illumina has already developed among customers in the therapy selection and NIPT spaces. (*see* CCFF ¶¶ 3749-4164). For example, Ariosa's former CEO, Mr. Song testified that Illumina is "kind of the big bully" and "people are scared of them." (PX7071 (Song (Omniome) IHT at 43-44)). [redacted]

It is misleading because if firms are unaware that Illumina is foreclosing on rivals, then Illumina will not suffer any reputational harm. For example, if customers are able to discover a potential breach by Illumina of the Open Offer, the Open Offer explicitly provides that they must submit the matter to "confidential binding arbitration." (*see* PX0064 at 008). Because enforcement of the Open Offer is confidential, other customers and industry participants would not learn of the breach. Thus, Illumina ensured, through its unilaterally imposed contractual terms, that its reputation cannot be harmed if it breaches the Open Offer. In addition, Illumina

can breach the Open Offer in subtle ways that will likely go undetected. [redacted]

> 866.3 If Illumina "did start raising rivals' costs, its reputation for doing that would become known, and Illumina's customers now, as well as future customers, would be reluctant to do business with Illumina because they wouldn't want to make these huge investments if they think that Illumina is going to take advantage of them in the future". (RX6000 (Carlton Trial Dep. at 33–34).)

Response to Finding No. 866.3

The proposed finding is misleading. It is far from certain that Illumina's reputation for raising rivals' costs would become known. As explained below, because of the secretive terms of the Open Offer, it is possible for Illumina to foreclose Grail's rivals without anything becoming public. Moreover, not all Illumina customers also compete directly with Illumina, and customers that do not compete directly with Illumina have less reason to be concerned that Illumina will foreclose them. Other recent examples of Illumina attempting to foreclose rivals have come in the therapy selection and NIPT spaces, where Illumina was a supplier of all customers but then entered the downstream market as a competitor. (*see* CCFF ¶¶ 3749-4164).

It is misleading because if firms are unaware that Illumina is foreclosing on rivals, then Illumina will not suffer any reputational harm. For example, if customers are able to discover a potential breach by Illumina of the Open Offer, the Open Offer explicitly provides that they must

submit the matter to "confidential binding arbitration." (*see* PX0064 at 008). Because enforcement of the Open Offer is confidential, other customers and industry participants would not learn of the breach. Thus, Illumina ensured, through its unilaterally imposed contractual terms, that its reputation cannot be harmed if it breaches the Open Offer. In addition, Illumina can breach the Open Offer in subtle ways that will likely go undetected. [redacted]

Additionally, the proposed finding is misleading because Illumina's reputation matters less for MCED test developers because MCED customers have nowhere else to go. [redacted] Singlera's Mr. Gao testified at trial that Illumina is the "800-pound" gorilla as "Illumina control[s] the supply chain for all the NGS-based early cancer detection technology, not only for Singlera, but for other companies." (Gao (Singlera) Tr. 2947-48; *see also* PX7042 (Gao (Singlera) IHT) at 88 (describing Singlera's relationship with Illumina as like being a "prisoner of war")). Therefore,

this Court should disregard the proposed finding for the reasons stated herein and in Responses to RPFF ¶¶ 1934-1946.

> 866.4 "Illumina's strategy of having customers who are inventing new uses for Illumina's NGS technology would be upended, and that would have negative consequences for Illumina and its profits." (RX6000 (Carlton Trial Dep. at 33–34).)

Response to Finding No. 866.4

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." See Order on Post-Trial Findings at 3. Here Respondents cite Dr. Carlton as the only source for the fact that Illumina has a "strategy of having customers who are inventing new uses for Illumina's NGS technology" in contravention of this Court's Order. This Court should disregard this evidence. The proposed finding is misleading and incomplete because Illumina can take action to foreclose Grail's rivals without other customers finding out, and customers would continue to invent new uses for Illumina's NGS technology because, for many applications, Illumina is the only viable choice of sequencing provider.

It is misleading because if firms are unaware that Illumina is foreclosing on rivals, then Illumina will not suffer any reputational harm. For example, if customers are able to discover a potential breach by Illumina of the Open Offer, the Open Offer explicitly provides that they must submit the matter to "confidential binding arbitration." (*see* PX0064 at 008). Because enforcement of the Open Offer is confidential, other customers and industry participants would not learn of the breach. Thus, Illumina ensured, through its unilaterally imposed contractual terms, that its reputation cannot be harmed if it breaches the Open Offer. In addition, Illumina can breach the Open Offer in subtle ways that will likely go undetected. [redacted]

[redacted]

Additionally, the proposed finding is misleading because Illumina's reputation matters less for MCED test developers because MCED customers have nowhere else to go. [redacted] Singlera's Mr. Gao testified at trial that Illumina is the "800-pound" gorilla as "Illumina control[s] the supply chain for all the NGS-based early cancer detection technology, not only for Singlera, but for other companies." (Gao (Singlera) Tr. 2947-48; *see also* PX7042 (Gao (Singlera) IHT) at 88 (describing Singlera's relationship with Illumina as like being a "prisoner of war")). Therefore, this Court should disregard the proposed finding for the reasons stated herein and in Responses to RPFF ¶¶ 1934-1946.

867. Illumina thus has an incentive to continue to innovate and reduce sequencing costs for customers who will discover clinical applications for Illumina's sequencers, not just in clinical oncology but in other areas as well. (RX3864 (Carlton Expert Report) ¶ 79).)

Response to Finding No. 867

[redacted]

[redacted]

3. **No Offsetting Advantage to Foreclosure.**

868. [redacted]

Response to Finding No. 868

[redacted]

[redacted]

[redacted]

869. As Mr. deSouza explained, "the testing business for many, many years will not have a profit, will lose business, and that's very typical in clinical testing businesses". (deSouza (Illumina) Tr. at 2386.)

Response to Finding No. 869

[redacted]

[redacted]

870. [redacted]

Response to Finding No. 870

[redacted]

[redacted]

871. It is only "after 2026" that Illumina gets "its first dollar of profit" from GRAIL, but "it's not until 2030 where we've recouped the losses we've made in GRAIL", and therefore, "about the next decade even, we really need and are really fueled by the profit pools associated with our sequencers." (deSouza (Illumina) Tr. 2383.)

Response to Finding No. 871

[redacted]

[redacted]

872. Thus, the uncontested evidence shows that Illumina's NGS business will remain its core business and will account for most of its profits for "many, many years". (deSouza (Illumina) Tr. at 2386.)

Response to Finding No. 872

The proposed finding is incorrect, vague, misleading, and incomplete. It is incorrect

because this evidence is not uncontested. [redacted] It is vague because it does not define the term "core business" or the duration of "many, many years." It is also based on self-serving testimony from Mr. deSouza, an Illumina executive who benefits from downplaying Illumina's incentive to foreclose Grail's competitors.

[redacted]

[redacted]

4. **No Evidence Illumina Can Target a Foreclosure Strategy to Avoid Upstream Losses.**

873. Although Illumina may have an understanding of the types of applications a customer is developing or marketing, in many cases it does not know what specific tests are in its customers' development pipeline. (Berry (Illumina) Tr. 849–53.)

Response to Finding No. 873

The proposed finding is unsupported by the record. Nothing in the cited portion of the transcript mentions that Illumina, "in many cases," does not know what specific tests are in its customers' development pipeline. However, the finding suggests that, at least sometimes, Illumina does know what specific tests are in its customers' development pipeline.

Further, the proposed finding is incomplete, misleading, and against the weight of the evidence. It is misleading and incomplete because Illumina learns about its customers' development plans from a variety of sources as explained throughout Complaint Counsel's post-trial briefing. As an example, Illumina learns about its customers' products and development plans from conversations that it has with its customers. [redacted] For example, Ms. Berry admitted at trial that Illumina identifies many customers that are buying its products for the purpose of developing or performing oncology tests through sales and service interactions

with customers. (Berry (Illumina) Tr. 657-58). Illumina also examines customers' product developments when it negotiates supply agreements and offers prices to customers. [redacted] During supply agreement negotiations with [redacted] Illumina also learns about its customers products and development plans from public information. [redacted] Illumina identifies many of its customers that are buying its products for the purpose of developing or performing oncology tests through public information. (Berry (Illumina) Tr. 655-56). For example, Illumina reviews company websites and regulatory filings to gather this information. (Berry (Illumina) Tr. 655-56). [redacted] Therefore, this Court should disregard the proposed finding.

> 873.1 For example, many of the MCED tests Complaint Counsel claims are in development are unknown to Illumina even today—much less their specific attributes that would allow Illumina to predict with confidence whether any test will be a close substitute to Galleri, or, instead, a market-expanding complement, foreclosure of which would cause no material diversion to Galleri but would result in substantial lost upstream sales. (RX6000 (Carlton Trial Dep. at 24, 26–27).)

Response to Finding No. 873.1

The proposed finding is unsupported and unreliable, and it should be disregarded. It cites to Respondents' witness, Dr. Carlton, for multiple factual assertions that are properly within the purview of fact witnesses. It is impermissible for Dr. Carlton to testify to whether he is aware that "many of the MCED tests Complaint Counsel claims are in development are unknown to

Illumina even today – much less their specific attributes…" Further, the proposed finding is vague because it does not define which MCED tests in development are supposedly unknown to Illumina.

Further, the proposed finding is incomplete, misleading, and against the weight of the evidence. It is misleading and incomplete because Illumina learns about its customers' development plans from a variety of sources. Illumina learns about its customers' products and development plans from conversations that it has with its customers. [redacted] For example, Ms. Berry admitted at trial that Illumina identifies many customers that are buying its products for the purpose of developing or performing oncology tests through sales and service interactions with customers. (Berry (Illumina) Tr. 657-58). Illumina also examines customers' product developments when it negotiates supply agreements and offers prices to customers. [redacted] During supply agreement negotiations with [redacted] Illumina also learns about its customers products and development plans from public information. [redacted] Illumina identifies many of its customers that are buying its products for the purpose of developing or performing oncology tests through public information. (Berry (Illumina) Tr. 655-56). For example, Illumina reviews company websites and regulatory filings to gather this information. (Berry (Illumina) Tr. 655-56). [redacted]

[redacted] Therefore, this Court should disregard the proposed finding for the reasons stated herein and in Responses to RPFF ¶¶ 1934-1946.

874. [redacted]

Response to Finding No. 874

[redacted]

875. Moreover, Illumina's instruments and consumables are multi-use products that can be and often are used by Illumina customers for a variety of sequencing applications. (*Supra* PFF ¶¶ 6–11.)

Response to Finding No. 875

The proposed finding is unsupported to the extent it makes no citation to the record, only to Respondents' other proposed findings of fact. The proposed finding is also vague and ambiguous because the terms "multi-use products" and "sequencing applications" are undefined. The proposed finding is also irrelevant as to whether Respondents would have the ability and incentive to foreclose Grail's rivals post-Aquisition. Therefore, this Court should disregard the proposed finding.

> 875.1 For example, Illumina markets its NovaSeq instrument and consumables, which are used by GRAIL for developing its early-detection tests, as "[f]lexibl[e] for virtually any genome, sequencing method, and scale of project". (RX2557 (Illumina) at 1.)

Response to Finding No. 875.1

The proposed finding is incomplete and misleading. Illumina designs and offers products tailored for customers to use in certain applications, including providing custom kits not just for specific applications, but also for specific customers. [redacted] For example, [redacted] Ms. Berry explained that Illumina offers "12 to 15 different kit configurations" for its NovaSeq sequencing instrument, so that it offers enough variety in reagents for "performance attributes that may be important to a particular customer." (Berry (Illumina) Tr. 827). Moreover, Ms. Berry admitted at trial that Illumina sells custom library kits to its NGS sequencing customers. (Berry (Illumina) Tr. 928 (stating that Illumina "sell[s] some very specific SKUs that . . . are absolutely marketed and designed for customers to, you know, specify their own specific content that they want to interrogate" and that "we [Illumina] will make a product specific to a customer's request")). This testimony is consistent with testimony from third parties, such as Guardant. Guardant's Bill Getty testified that Illumina provides Guardant with "customization and optimization of our

reagents." (PX7105 (Getty (Guardant) Dep. at 60-62)). Therefore, this Court should disregard the proposed finding.

876. If, hypothetically, Illumina were to cut off service to an instrument as Complaint Counsel speculates, that action could impact a range of tests (commercialized and in development), resulting in upstream losses without offsetting downstream gains from diversion. (RX6000 (Carlton Trial Dep. at 26–27).)

Response to Finding No. 876

[redacted]

877. Moreover, even if Illumina hypothetically could target a particular MCED test in development, news of Illumina's opportunistic conduct would reduce future sales to a range of

applications, not just the targeted MCED test. (RX3864 (Carlton Rep.) ¶ 49); RX6000 (Carlton Trial Dep.) at 33–34).)

Response to Finding No. 877

The proposed finding is vague, misleading, and incomplete. It is vague because it is not clear what the "range of applications" is that Respondents are referring to. It is misleading and incomplete because Illumina can take action to foreclose Grail's rivals without other customers finding out, and customers would continue to invent new uses for Illumina's NGS technology because, for many applications, Illumina is the only viable choice of sequencing provider.

It is misleading because if firms are unaware that Illumina is foreclosing on rivals, then Illumina will not suffer any reputational harm. For example, if customers are able to discover a potential breach by Illumina of the Open Offer, the Open Offer explicitly provides that they must submit the matter to "confidential binding arbitration." (*see* PX0064 at 008). Because enforcement of the Open Offer is confidential, other customers and industry participants would not learn of the breach. Thus, Illumina ensured, through its unilaterally imposed contractual terms, that its reputation cannot be harmed if it breaches the Open Offer. In addition, Illumina can breach the Open Offer in subtle ways that will likely go undetected. [redacted]

Additionally, the proposed finding is misleading because Illumina's reputation matters less for MCED test developers because MCED customers have nowhere else to go. [redacted]

[redacted] Singlera's Mr. Gao testified at trial that Illumina is the "800-pound" gorilla as "Illumina control[s] the supply chain for all the NGS-based early cancer detection technology, not only for Singlera, but for other companies." (Gao (Singlera) Tr. 2947-48; *see also* PX7042 (Gao (Singlera) IHT) at 88 (describing Singlera's relationship with Illumina as like being a "prisoner of war")). Therefore, this Court should disregard the proposed finding for the reasons stated herein and in Responses to RPFF ¶¶ 1934-1946.

877.1 As Mr. deSouza observed:

> "[I]f we were to raise prices on GRAIL, we would lose a lot more in sequencing business from the other markets. . . . The rest of our customers, whether they are in cancer detection or cancer at all, would look at what we did here and would be concerned about us doing that in the other markets that they're in. And so there would be a knock-on effect where we would lose sequencing business across our 7000 other customers who would be concerned about that kind of behavior. And so we wouldn't do that because, again, the much bigger part of our business is the sequencer business. So losses there really are much more impactful."
>
> (deSouza (Illumina) Tr. 2381–82.)

Response to Finding No. 877.1

The proposed finding is vague, misleading, and incomplete. It is vague because it is unclear what a "knock-on effect" is or which of Illumina's "7000 other customers" they would expect to lost business from. It is also based on self-serving testimony from Mr. deSouza, an Illumina executive who benefits from downplaying Illumina's incentive to foreclose Grail's

competitors. It is misleading because Illumina's customers that are not also competing with Illumina in downstream applications are unlikely to be "concerned about [Illumina] doing that in the other markets that they're in." Finally, the proposed finding is misleading and incomplete because Illumina can take action to foreclose Grail's rivals without other customers finding out, and customers would continue to invent new uses for Illumina's NGS technology because, for many applications, Illumina is the only viable choice of sequencing provider.

The proposed finding is misleading because if firms are unaware that Illumina is foreclosing on rivals, then Illumina will not suffer any reputational harm. For example, if customers are able to discover a potential breach by Illumina of the Open Offer, the Open Offer explicitly provides that they must submit the matter to "confidential binding arbitration." (*see* PX0064 at 008). Because enforcement of the Open Offer is confidential, other customers and industry participants would not learn of the breach. Thus, Illumina ensured, through its unilaterally imposed contractual terms, that its reputation cannot be harmed if it breaches the Open Offer. In addition, Illumina can breach the Open Offer in subtle ways that will likely go undetected. [redacted]

Additionally, the proposed finding is misleading because Illumina's reputation matters less for MCED test developers because MCED customers have nowhere else to go. [redacted]

[redacted] Singlera's Mr. Gao testified at trial that Illumina is the "800-pound" gorilla as "Illumina control[s] the supply chain for all the NGS-based early cancer detection technology, not only for Singlera, but for other companies." (Gao (Singlera) Tr. 2947-48; *see also* PX7042 (Gao (Singlera) IHT) at 88 (describing Singlera's relationship with Illumina as like being a "prisoner of war")). Therefore, this Court should disregard the proposed finding.

878. Complaint Counsel's foreclosure theory does not take these real-world constraints into account. [redacted]

Response to Finding No. 878

[redacted]

[redacted]

G. NGS Costs Will be a Very Small Part of Future MCED Test Revenues and Profits.

1. Relevance of Upstream Input Costs Relative to Downstream Margins and Revenues.

879. One factor influencing the ability to successfully carry out a RRC strategy—and thus the incentive to engage in it—is the importance of an upstream firm's input costs to downstream rivals. (RX3864 (Carlton Expert Report) ¶ 62).

Response to Finding No. 879

The proposed finding is vague because it does not define what is meant by "influencing," "successfully carry out a RRC strategy," "importance," or "input costs." Moreover, the proposed finding is confusing because there is neither an explanation for when "input costs" would be "important[t]" nor how such costs "influenc[e]" a "RRC strategy."

The proposed finding is unsupported to the extent it makes a factual claim about Illumina's relationship as a supplier to Grail's rivals. No factual evidence is cited for the fact that "the importance of an upstream firm's input costs to downstream rivals" is a "factor influencing the ability to successfully carry out a RRC strategy" "and thus the incentive to engage in it." Moreover, this Court ordered that experts shall not be cited to "support factual

propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Carlton's expert report as the only source of evidence supporting this fact in contravention of this Court's order. The Court should disregard this evidence.

The proposed finding is also irrelevant. The correct question for assessing the ability to harm competition is not the percentage of an upstream product's costs relative to downstream competitors' profit, but rather whether the upstream product is a competitively significant input for the downstream market. As Complaint Counsel has explained extensively in its post-trial briefing, MCED test developers are dependent on Illumina's NGS platform.

The proposed finding is misleading and incomplete because it suggests that lower NGS prices to Grail's rivals somehow impairs Illumina's ability to harm them. The weight of the evidence contradicts Respondents' suggestion. Rather, it is clear that Illumina would have many tools at its disposal to harm Grail's rivals, including but not limited to charging relatively higher prices to rivals compared to Grail. [redacted] Therefore, this Court should disregard the proposed finding for the reasons stated herein and in Responses to RPFF ¶¶ 1934-1946.

880. There is "a very close relationship" between the prices a vertically integrated firm charges a rival for an input and the firm's incentive and ability to foreclose because "that ability is going to depend on the importance of cost in the downstream firm's reliance on" the upstream firm. (RX6000 (Carlton Trial Dep.) at 28.)

Response to Finding No. 880

The proposed finding is vague to the extent it does not define "relationship," "foreclose," "importance of cost" and "reliance on the upstream firm." The proposed finding is also confusing because it is unclear what is meant by "very close relationship" between price and the upstream firm's ability and incentive to foreclose. In addition, this Court ordered that experts

shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. The proposed finding is unsupported to the extent it purports to present as fact what the relationship is between NGS costs and Illumina's ability and incentive to harm Grail's rivals, as Dr. Carlton does in his full quoted testimony. (RX6000 (Calrton Trial Dep. at 28)) (noting that "ability is going to depend on the importance of cost in the downstream firm's reliance on in this case Illumina"). Here Respondents cite to the self-serving testimony of their own economic expert, Dr. Carlton, testimony as the only source of evidence supporting this fact in contravention of this Court's order. The Court should disregard this evidence.

The proposed finding is misleading and incomplete to the extent insofar as it states lower input costs implicate the upstream firm's ability to foreclose downstream competition. The unit price of a critical input is irrelevant to the upstream firm's ability to foreclose downstream rivals. In this case, regardless of what the price of sequencing is relative to MCED revenue, the weight of the evidence is clear that Illumina will have the ability to harm Grail's rivals by withholding, or offering inferior terms for, its NGS platform for which MCED test developers have no alternatives. [redacted] Therefore, this Court should disregard the proposed finding for the reasons stated herein and in Responses to RPFF ¶¶ 1934-1946.

881. If input costs are a small number today, or expected to be a small number in during the relevant time frame for the vertical analysis, it means the upstream firm will not have the ability to impose a large cost increase on a downstream rival because the cost increase would have to be substantial. (RX6000 (Carlton Trial Dep.) at 28–29.)

Response to Finding No. 881

The proposed finding is vague because it does not define "input costs," "small number," "relevant time frame for the vertical analysis," "large cost increase" or "substantial." It is also confusing because it presents a hypothetical situation with vague assumptions. The proposed

finding should be disregarded to the extent that the hypothetical situation described makes a factual claim as to Illumina's ability to foreclose or offer inferior terms to Grail's rivals. This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (*See* Order on Post-Trial Findings at 3). Here Respondents cite to the self-serving testimony of their own economic expert, Dr. Carlton, as the only source of evidence supporting the proposed fact in contravention of this Court's Order.

The proposed finding is also misleading and incomplete. It disregards the fact that an upstream firm that faces no competition, such as Illumina, could nevertheless impose a substantial price increase on downstream rivals of Grail, or it could decide to engage in myriad other behaviors to disadvantage the downstream rivals—withholding or delaying access to new technology, reducing the quality of service, denying access to information and licenses necessary for FDA approval and commercialization, and sharing competitively sensitive information with Grail. The proposed finding also adopts a myopic focus on price-related harms when Complaint Counsel has alleged and shown that Illumina has a myriad of non-price related levers that Respondents can use to disadvantage Grail's rivals post-Acquisition**.** [redacted] In any event, the hypothetical posed by the proposed finding—and any suggestion that it illustrates the dynamics between Illumina and Grail's rivals—is contradicted by the weight of the evidence that clearly shows Illumina will have the ability and incentive to foreclose or otherwise disadvantage Grail's rivals. [redacted] Therefore, this Court should disregard the proposed finding for the reasons stated herein and in Responses to RPFF ¶¶ 1934-1946.

882. If downstream margins are big enough, an input price increase could be absorbed by reducing downstream rivals' profits, rather than raising downstream price. This would result in no harm to consumers and, also, no diversion to GRAIL. (RX3864 (Carlton Expert Report) ¶ 62, n.181.)

Response to Finding No. 882

The proposed finding is vague because it does not define "big enough," "harm to consumers," and "diversion."

The proposed finding is unsupported insofar as it makes a factual claim about Illumina's relationship as a supplier to Grail's rivals. No factual evidence is cited. Moreover, this Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (*See* Order on Post-Trial Findings at 3). Here, Respondents cite Dr. Carlton's expert report as the only source of evidence supporting this fact in contravention of this Court's order. The Court should disregard this evidence.

The proposed finding is also irrelevant. The correct question for assessing the ability to harm competition is not the percentage of an upstream product's costs relative to downstream competitors' profit, but rather whether the upstream product is a competitively significant input for the downstream market. As Complaint Counsel has explained extensively in its post-trial briefing, MCED test developers are dependent on Illumina's NGS platform.

The proposed finding is also misleading and incomplete. Dr. Carlton, in his direct testimony on this point, noted that the downstream firm might also pass on increased input prices to consumers. (RX6000 (Carlton Trial Dep. at 28-29)). In addition, there are other ways harming downstream rivals could impact competition aside from passing along increased input prices to consumers. The downstream firm might reduce its product quality in response, or it might have less ability to innovate to create better or more cost-effective products. Moreover, the proposed finding focuses on price increases to downstream rivals.

The proposed finding is also misleading and incomplete insofar as it disregards the fact that an upstream firm that faces no competition could nevertheless impose a substantial price

increase on downstream rivals, or it could decide to engage in myriad other behaviors to disadvantage the downstream rivals, including complete foreclosure. In any event, the hypothetical posed by the proposed finding—and any suggestion that it illustrates the dynamics between Illumina and Grail's rivals—is contradicted by the weight of the evidence that clearly shows Illumina will have the ability and incentive to foreclose or otherwise disadvantage Grail's rivals. [redacted] Therefore, this Court should disregard the proposed finding for the reasons stated herein and in Responses to RPFF ¶¶ 1934-1946.

883. In a case where input costs are, or are projected to be, a small share of downstream revenues, that alone shows that "there are real constraints on the ability" of the upstream firm to foreclose downstream rivals. (RX6000 (Carlton Trial Dep. at 28–30).)

Response to Finding No. 883

The proposed finding is vague because it does not define "projected," "small share," "downstream revenues," "real constraints," or "foreclose."

The proposed finding is unsupported to the extent that it makes a factual claim about Illumina's relationship as a supplier to Grail's rivals. No factual evidence is cited. Moreover, this Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (*See* Order on Post-Trial Findings at 3). Here Respondents cite the self-serving testimony of their own economic expert, Dr. Carlton, as the only source of evidence supporting this fact in contravention of this Court's order. The Court should disregard this evidence.

The proposed finding is also irrelevant. The correct question for assessing the ability to harm competition is not the percentage of an upstream product's costs relative to downstream competitors' profit, but rather whether the upstream product is a competitively significant input for the downstream market. As Complaint Counsel has explained extensively in its post-trial briefing, MCED test developers are dependent on Illumina's NGS platform.

The proposed finding is also misleading and incomplete. It draws an inference from the price charged to downstream firms that, without additional context, is inappropriate. In any event, the hypothetical posed by the proposed finding—and any suggestion that it illustrates the dynamics between Illumina and Grail's rivals—is contradicted by the weight of the evidence that clearly shows Illumina will have the ability and incentive to foreclose or otherwise disadvantage Grail's rivals. [redacted] Therefore, this Court should disregard the proposed finding for the reasons stated herein and in Responses to RPFF ¶¶ 1934-1946..

2. **Evidence of projected Illumina NGS costs relative to projected downstream MCED revenues and margins.**

884. The only evidence in the record on NGS costs as a percentage of future downstream MCED revenues and margins shows that NGS costs will be a very small percentage of MCED test revenues and margins in the future. (RX6000 (Carlton Trial Dep.) at 30–31.)

Response to Finding No. 884

The proposed finding is vague because it does not define "NGS costs," "future downstream MCED revenues and margins," "very small percentage" and "in the future." The vagueness of the terms, including what constitutes "a very small percentage" without additional context or any factual support make this proposed finding confusing and unreliable.

The proposed finding is unsupported to the extent it relies on self-serving expert testimony to make a conclusory factual statement about what is in the record. No factual evidence is cited. Moreover, this Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (*See* Order on Post-Trial Findings at 3). Here Respondents cite the self-serving testimony of their own economic expert, Dr. Carlton, as the only source of evidence supporting this fact in contravention of this Court's order. The Court should disregard this evidence.

The proposed finding is misleading and incomplete to the extent it purports to make an

unsupported conclusory statement about what evidence is in the record and its implications for Illumina's ability and incentive to harm Grail's rivals. The percentage of NGS costs as a portion of downstream MCED revenues or margins is irrelevant for whether Illumina will have the ability and incentive to harm Grail's rivals. To the extent the finding suggests anything about the dynamics between Illumina and Grail's rivals, it is contradicted by the weight of the evidence that clearly shows Illumina will have the ability and incentive to foreclose or otherwise disadvantage Grail's rivals. [redacted] Therefore, this Court should disregard the proposed finding for the reasons stated herein and in Responses to RPFF ¶¶ 1934-1946.

885. The only evidence of projected future NGS costs in the record is from Illumina's [redacted]

[redacted]

[redacted]

888.3 Illumina's technological improvements are expected to drive significant reductions in Illumina input costs for GRAIL and any rival, and, even in the absence of those improvements, GRAIL and any rival, can improve the sequencing efficiency of their tests, reducing their reliance on Illumina inputs. (RX3864 (Carlton Expert Report) ¶ 70.)

Response to Finding No. 888.3

[redacted]

The proposed finding is misleading and incomplete to the extent it suggests anything about Illumina's ability and incentive to harm Grail's rivals. The percentage of NGS costs as a portion of downstream MCED revenues or margins—and the ability to "improve the sequencing efficacy" of MCED testing—is irrelevant for whether Illumina will have the ability and incentive

to harm Grail's rivals: Illumina still provides a critical input for MCED testing, for which there are no alternatives. [redacted]

888.4 The projected improvements in the number of reads per flow cell reduce the cost per test of Illumina's inputs for test developers and underpin Illumina's commitment to reduce sequencing costs per gigabase made available to customers by at least 43 percent by 2025. (PX7104 (Aravanis (Illumina) Dep. at 218–19); [redacted]

Response to Finding No. 889

[redacted]

[redacted]

890. [redacted]

Response to Finding No. 890

[redacted]

[redacted]

[redacted]

891. At the time of the Illumina deal model, GRAIL paid Illumina approximately $135 per test, which the deal model projects will fall by ~80% in 2023 when V3 of Galleri is released, which will allow GRAIL to run five times as many samples per flow cell. (PX4091 (GRAIL) at -016).

Response to Finding No. 891

The proposed finding is vague to the extent "the time of the Illumina deal model" is undefined. The proposed finding is vague because it does not define "deal model," "V3 of Galleri," or "released." It is also confusing to the extent it does not identify how a "deal model" projects any prices Grail paid to Illumina per test. The proposed finding is unsupported to the extent it contains no citation to the deal model, or any other support for the claimed forthcoming drop in Grail's per-test payments to Illumina. [redacted] The proposed finding is misleading to the extent it depends on the significant unsupported assumption that the price of Illumina flow cells will remain constant even as the need for them decreases. (*See* PX7104 (Aravanis (Illumina) Dep. at 203–05 (noting that talking about the number of samples that can be put on a flow cell tells you nothing if you don't take into account the price of the flow cell)).

[redacted]

[redacted]

892. Illumina's supply contracts commit to reducing the price of Illumina's instruments and consumables by 43% by 2025. (PX0064 (Illumina) §5.d.)

Response to Finding No. 892

The proposed finding is vague because it does not define "supply contracts," "commit," or "price of Illumina's instruments and consumables."

The proposed finding is misleading to the extent it implies that reducing the price of sequencing by at least 43 percent meaningful to customers. [redacted] And, internally, [redacted] A price decrease from $600 to $100 would be an 83 percent decrease, much higher than 43 percent. (Berry (Illumina) Tr. 715). [redacted]

[redacted]

The proposed finding is also incomplete and misleading to the extent it implies that there will, in fact, be a price decrease of 43 percent to MCED customers. Specifically, the proposed finding is incomplete because Respondents omit that the 43 percent discount is only off the price per gigabase of sequencing, and it is misleading because a reduction in price per gigabase is irrelevant to MCED test developers. (PX0064 at 007 (Illumina Open Offer, Mar. 29, 2021); Berry (Illumina) Tr. 923)). Respondents use "price per gigabase" instead of price per read which is the most appropriate measure of price for liquid biopsy MCED tests. The ability to read one gigabase is equal to one billion nucleotides. [redacted] And, according to Illumina's own internal sequencing cost calculator, simply because the price *per gigabase* decreases does not mean that the price *per read* will also decrease. [redacted]

[redacted]

The proposed finding is misleading and incomplete to the extent it suggests anything about Illumina's ability and incentive to harm Grail's rivals. The percentage of NGS costs as a portion of downstream MCED revenues or margins is irrelevant for whether Illumina will have the ability and incentive to harm Grail's rivals. [redacted]

[redacted] Therefore, this Court should disregard the proposed finding.

899. To the extent that any GRAIL rival emerges and has similar costs and test prices to GRAIL and [redacted], Illumina would need to raise price to GRAIL's rivals by a large amount for a RRC strategy to have significant impact. (RX3864 (Carlton Expert Report) ¶ 65.)

Response to Finding No. 899

[redacted]

900. To the extent that any GRAIL rival has comparable sequencing efficiency to GRAIL, Illumina input costs are not likely to be an important determinant of downstream profits. (RX3864 (Carlton Expert Report) ¶ 70.)

Response to Finding No. 900

The proposed finding is vague because it does not define "comparable sequencing efficiency," "input costs," "important determinant," or "downstream profits."

The proposed finding is unsupported because it relies on Respondents' own expert report for a factual proposition. No factual evidence is cited. Moreover, this Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (*See* Order on Post-Trial Findings at 3). Here Respondents cite the self-serving report of their own economic expert, Dr. Carlton, as the only source of evidence supporting this fact in contravention of this Court's order. The Court should disregard this evidence.

The proposed finding is misleading and incomplete to the extent it suggests anything about Illumina's ability and incentive to harm Grail's rivals. The percentage of NGS costs as a portion of downstream MCED revenues or margins is irrelevant for whether Illumina will have the ability and incentive to harm Grail's rivals. [redacted]

[redacted] Therefore, this Court should disregard the proposed finding for the reasons stated herein and in Responses to RPFF ¶¶ 1934-1946.

901. [redacted]

Response to Finding No. 901

[redacted]

[redacted]

902. Consistent with the documentary evidence from the internal business documents, Dr. Aravanis explained that sequencing costs will continue to "decrease over time" as a percentage of Galleri's costs due to GRAIL "innovations that will lead to a decreased usage of sequencing over time," which by itself, would reduce the amount of cost associated with sequencing per test," and in addition, "Illumina is also going to lower the cost of sequencing over time," as will "other sequencing providers", which will "compound the overall reduction in sequencing costs as a fraction of the test." (Aravanis (Illumina) Tr. 1924–25.)

Response to Finding No. 902

[redacted]

[redacted]

[redacted]

903. Mr. deSouza similarly explained that, "today sequencing costs represent about 10 percent of the price of Galleri" and "[b]y 2025, we project that sequencing costs will be less than 4 percent of the price of GRAIL's Galleri test." (deSouza (Illumina) Tr. 2388.)

Response to Finding No. 903

The proposed finding is vague because it does not define "sequencing costs," "price of Galleri," or "project."

The proposed is unsupported to the extent it seeks to implicate the sequencing costs of any of Grail's rivals. The finding relies solely upon the self-serving testimony of Illumina's CEO, Mr. deSouza, to describe Grail's sequencing costs. The proposed finding is misleading and incomplete to the extent it suggests anything about Illumina's ability and incentive to harm Grail's rivals. The percentage of NGS costs as a portion of downstream MCED revenues or margins is irrelevant for whether Illumina will have the ability and incentive to harm Grail's rivals. [redacted]

[redacted] Therefore, this Court should disregard the proposed finding.

3. **Significance Of Illumina's Declining NGS Costs And NGS Innovation.**

909. [redacted]

Response to Finding No. 909

[redacted]

[redacted]

910. [redacted]

[redacted]

Response to Finding No. 910

[redacted]

[redacted]

[redacted]

910.1 For example, Mr. deSouza explained that Illumina "will continue to see profit pool[s] in the sequencer business, but we believe that because of the competition in this business, the profit pools will -- the operating margin will decline over the years. And so . . . because of the competition, we expect a decline in the profit pools associated with sequencers, although it will continue to be a profitable business." (deSouza (Illumina) Tr. 2385.)

Response to Finding No. 910.1

The proposed finding is vague because it does not define "profit pool," "sequencer business," "competition," "operating margin," "expect," "decline," or "profitable business."

The proposed finding—which relies on self-serving testimony of Illumina's CEO—is misleading and incomplete because it makes vague suggestions about NGS competition broadly and how it could affect "profit pools" while citing no specifics about any company that would cause Illumina to have lower profits. Importantly, the proposed finding says nothing about Illumina's expected profits as it relates to the relevant market participants in this case—MCED testing customers—that only make up a very small percentage of Illumina's total revenue. In

fact, Mr. deSouza told investors that MCED customers account for "roughly 2% of [Illumina's] total revenue" and was aware of "maybe 20 out of [its] 6,600 customers who are targeting a commercial screening test." (CCFF ¶ 3140). The proposed finding's general claims about NGS competition—which are too vague to assess their validity or relevance to Illumina's ability and incentive to harm Grail's rivals—are of dubious evidentiary value.

The proposed finding is misleading and incomplete to the extent it suggests anything about Illumina's ability and incentive to harm Grail's rivals. The percentage of NGS costs as a portion of downstream MCED revenues or margins is irrelevant for whether Illumina will have the ability and incentive to harm Grail's rivals. It disregards the fact that an upstream firm that faces no competition, such as Illumina, could nevertheless impose a substantial price increase on downstream rivals of Grail, or it could decide to engage in myriad other behaviors to disadvantage the downstream rivals, such as withholding or delaying access to new technology, reducing the quality of service, denying access to information and licenses necessary for FDA approval and commercialization, and sharing competitively sensitive information with Grail. (*See* CCFF ¶¶ 2702-3078). The proposed finding also adopts a myopic focus on price-related harms when harm to innovation is important for MCED testing competition. (*See* CCFF ¶¶ 3570-3668). In any event, the hypothetical posed by the proposed finding—and any suggestion that it illustrates the dynamics between Illumina and Grail's rivals—is contradicted by the weight of the evidence that clearly shows Illumina will have the ability and incentive to foreclose or otherwise disadvantage Grail's rivals. (*See* CCFF ¶¶ 2607-3569). Therefore, this Court should disregard the proposed finding.

> 910.2 Mr. deSouza further noted, that NGS competition is "reflected in Illumina's pricing plans and strategy" in that it "shows up in our expectation of the price of sequencing in the market, and it's continuing to decline" and "in our expectations of sort of the margin evolution in the industry". (deSouza (Illumina) Tr. 2331–32.)

Response to Finding No. 910.2

The proposed finding is vague because it does not define "NGS competition," "reflected," "Illumina's pricing plans and strategy," "shows up," "expectation," "price of sequencing," "the market," "decline," "sort of the margin evolution, or "the industry."

The proposed finding—which relies on self-serving testimony of Illumina's CEO—is misleading and incomplete because it makes vague suggestions about NGS competition broadly and how it could affect "margins" while citing no specifics about any company that would cause Illumina to have lower margins. Importantly, the proposed finding says nothing about Illumina's expected profits as it relates to the relevant market participants in this case—MCED testing customers—that only make up a very small percentage of Illumina's total revenue. In fact, Mr. deSouza told investors that MCED customers account for "roughly 2% of [Illumina's] total revenue" and was aware of "maybe 20 out of [its] 6,600 customers who are targeting a commercial screening test." (CCFF ¶ 3140). The proposed finding's general claims about NGS competition—which are too vague to assess their validity or relevance to Illumina's ability and incentive to harm Grail's rivals—are of dubious evidentiary value.

The proposed finding is misleading and incomplete to the extent it suggests anything about Illumina's ability and incentive to harm Grail's rivals. The percentage of NGS costs as a portion of downstream MCED revenues or margins is irrelevant for whether Illumina will have the ability and incentive to harm Grail's rivals. It disregards the fact that an upstream firm that faces no competition, such as Illumina, could nevertheless impose a substantial price increase on downstream rivals of Grail, or it could decide to engage in myriad other behaviors to disadvantage the downstream rivals, such as withholding or delaying access to new technology, reducing the quality of service, denying access to information and licenses necessary for FDA

approval and commercialization, and sharing competitively sensitive information with Grail. (*See* CCFF ¶¶ 2702-3078). The proposed finding also adopts a myopic focus on price-related harms when harm to innovation is important for MCED testing competition. (*See* CCFF ¶¶ 3570-3668). In any event, the hypothetical posed by the proposed finding—and any suggestion that it illustrates the dynamics between Illumina and Grail's rivals—is contradicted by the weight of the evidence that clearly shows Illumina will have the ability and incentive to foreclose or otherwise disadvantage Grail's rivals. (*See* CCFF ¶¶ 2607-3569). Therefore, this Court should disregard the proposed finding.

> 910.3 Similarly, Dr. Febbo explained, "[w]e have dropped the cost of sequencing through our investment in R&D, through our kind of dogged focus on making sequencing more affordable, because in research what we saw is a term we called elasticity, where the less expensive the sequencing was, the more sequencing was performed, so that it made sense to continue to drop the cost." (Febbo (Illumina) Tr. 4329–30.)

Response to Finding No. 910.3

The proposed finding is misleading and incomplete to the extent it purports to suggest anything about NGS competition. In fact, Dr. Febbo is stating that lowering NGS costs expanded Illumina's profits: because "the less expensive the sequencing was, the more sequencing was performed," it "made sense to continue to drop the cost." He did not say that "it made sense to drop the cost" because Illumina faced a competitive threat for MCED testing. Indeed, the fact that Respondents decreased the price of sequencing and invested in R&D historically—despite experiencing very little competition for MCED testing—undercuts their claims that future estimates of lower NGS costs signify that Illumina will face NGS competition for MCED testing. A monopolist innovating to lower the cost of a product to expand its total profits does not indicate competition. *See* Richard J. Gilbert, *Competition and Innovation*, 1 J. Industrial Org. Ed. 8, 3-9 (2006) (illustrating how a monopolist with no competition will

nevertheless have an incentive to invest in innovation if it expects the profits from that innovation to exceed its current profits).

The proposed finding is misleading and incomplete to the extent it suggests anything about Illumina's ability and incentive to harm Grail's rivals. The percentage of NGS costs as a portion of downstream MCED revenues or margins is irrelevant for whether Illumina will have the ability and incentive to harm Grail's rivals. It disregards the fact that an upstream firm that faces no competition, such as Illumina, could nevertheless impose a substantial price increase on downstream rivals of Grail, or it could decide to engage in myriad other behaviors to disadvantage the downstream rivals, such as withholding or delaying access to new technology, reducing the quality of service, denying access to information and licenses necessary for FDA approval and commercialization, and sharing competitively sensitive information with Grail. (*See* CCFF ¶¶ 2702-3078). The proposed finding also adopts a myopic focus on price-related harms when harm to innovation is important for MCED testing competition. (*See* CCFF ¶¶ 3570-3668). In any event, the hypothetical posed by the proposed finding—and any suggestion that it illustrates the dynamics between Illumina and Grail's rivals—is contradicted by the weight of the evidence that clearly shows Illumina will have the ability and incentive to foreclose or otherwise disadvantage Grail's rivals. (*See* CCFF ¶¶ 2607-3569). Therefore, this Court should disregard the proposed finding.

911. Even if a large increase in input prices were permitted and Illumina had no reputational concerns, a downstream rival could completely absorb an increase of even, say, 100 percent, without materially affecting their margins. (RX3864 (Carlton Expert Report) ¶ 75, n.208.)

Response to Finding No. 911

The proposed finding is vague because it does not define "large increase," "input prices," "permitted," "reputational concerns," "completely absorb," "an increase," "materially affecting"

or "margins."

The proposed finding is unsupported because it relies on Respondents' own expert report for a factual proposition. No factual evidence is cited. Moreover, this Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite the self-serving report of their own economic expert, Dr. Carlton, as the only source of evidence supporting this fact in contravention of this Court's order. The Court should disregard this evidence.

The proposed finding is unsupported and misleading. [redacted] even though Illumina, as the dominant provider of NGS products and services, could likely extract even greater price increases through a raising rivals' costs strategy due to the absence of NGS competitors. (*See generally* CCFF ¶¶ 1019-1200).

The proposed finding is misleading and incomplete to the extent it suggests anything about Illumina's ability and incentive to harm Grail's rivals. [redacted] is irrelevant for whether Illumina will have the ability and incentive to harm Grail's rivals. It disregards the fact that an upstream firm that faces no competition, such as Illumina, could nevertheless impose a substantial price increase on downstream rivals of Grail, or it could decide to engage in myriad other behaviors to

disadvantage the downstream rivals, such as withholding or delaying access to new technology, reducing the quality of service, denying access to information and licenses necessary for FDA approval and commercialization, and sharing competitively sensitive information with Grail. (*See* CCFF ¶¶ 2702-3078). The proposed finding also adopts a myopic focus on price-related harms when harm to innovation is important for MCED testing competition. (*See* CCFF ¶¶ 3570-3668). In any event, the hypothetical posed by the proposed finding—and any suggestion that it illustrates the dynamics between Illumina and Grail's rivals—is contradicted by the weight of the evidence that clearly shows Illumina will have the ability and incentive to foreclose or otherwise disadvantage Grail's rivals. (*See* CCFF ¶¶ 2607-3569). Therefore, this Court should disregard the proposed finding for the reasons stated herein and in Responses to RPFF ¶¶ 1934-1946.

> 911.1 For example, even in the absence of the contractual prohibition on raising costs, if Illumina doubled the prices it charges for its instruments, consumables, and services, and the GRAIL rival left its test price unchanged, the rival would see only a nominal decline in profits. (RX3864 (Carlton Expert Report) ¶ 75, n.208.)

Response to Finding No. 911.1

[redacted]

[redacted]

911.2 [redacted]

Response to Finding No. 911.2

[redacted]

[redacted]

911.3 It is inconceivable that even this very large increase in Illumina's input price would have a large effect on the competitiveness of downstream firms. (RX3864 (Carlton Expert Report) ¶ 75, n.208.)

915. Dr. Scott Morton fails to address whether she believes the large price increases that would be required to raise rivals' costs meaningfully are likely or indicate the magnitude of such increases or assess the negative impacts that such increases could have on Illumina's business. (RX3864 (Carlton Expert Report) ¶ 65.)

Response to Finding No. 915

[redacted]

[redacted]

H. Complaint Counsel's Theory Ignores Intensifying Upstream Competition.

1. Relevance Of Current And Future Upstream Competition.

916. A necessary condition for a vertical merger to harm competition in the relevant market is a limited ability by the merged firm's rivals to switch their purchases of the related product to sufficiently close substitutes. (RX3871 (Willig Expert Report) ¶ 41, n.59; RX3701 (Vertical Merger Guidelines) at 4-5).)

Response to Finding No. 916

The proposed finding is misleading to the extent it implies that Complaint Counsel needs to define a related product market or otherwise show upstream monopoly. As explained by Complaint Counsel's post-trial briefing, Complaint Counsel is not required to define a market or prove that Illumina is a monopolist. (Complaint Counsel's Post-Trial Brief at 66-71).

Complaint Counsel also objects to this proposed finding as improper expert testimony offered in contravention of this Court's order. Dr. Willig submitted an expert report as well as deposition testimony. (*See,* RX3871 (Willig Expert Report); PX7132, (Willig Dep.)). [redacted] Accordingly, Respondents asked the Court to allow them to substitute a new expert to "step into Dr. Willig's shoes." (Mot. for Leave to Substitute a Replacement Expert Witness,

2). The Court granted Respondents' narrow request holding that Respondents may *substitute* a new expert for Dr. Willig. (Order Granting Respondents' Motion for Leave to Substitute a Replacement Expert Witness, 4). Respondents took advantage of this Court's order by designating Dr. Michael Katz who submitted his own expert report and later testified by trial deposition. (*See* PX6105 (Katz Expert Report); RX6004 (Katz Trial Dep.).

Respondents continued reliance on Dr. Willig's expert opinions contravenes this Court's order and prejudices Complaint Counsel as Complaint Counsel has not an opportunity to cross examine this witness at trial in violation of Complaint Counsel's rights under this Court's Rules. *See* Rule 3.41 (c) ("Every party . . .shall have the right of due notice, cross-examination, presentation of evidence, objection, motion, argument, and all other rights essential to a fair hearing."). As such, Respondents' Proposed Finding should be disregarded in its entirety as improper expert opinion. Therefore, this Court should disregard the proposed finding.

> 916.1 Complaint Counsel was required to establish that Illumina has a monopoly over platforms viable for MCED development, and that there will be no viable substitutes (from the standpoint of MCED test developers that could potentially compete with Galleri) for Illumina's NGS platforms during the relevant time period. (RX3871 (Willig Expert Report) ¶ 41.)

Response to Finding No. 916.1

The proposed finding should be disregarded because it is not a "finding of fact," but rather a legal conclusion in contravention of this Court's order and the Part 3 rules. (*See* 16 C.F.R. § 3.46; Order on Post-Trial Findings). The proposed finding is misleading to the extent it implies that Complaint Counsel needs to define a related product market or otherwise show upstream monopoly. As explained by Complaint Counsel's post-trial briefing, Complaint Counsel is not required to define a market or prove that Illumina is a monopolist. (Complaint Counsel's Post-Trial Brief at 66-71).

Complaint Counsel also objects to this proposed finding as improper expert testimony

offered in contravention of this Court's order. Dr. Willig submitted an expert report as well as deposition testimony. (*See,* (RX3871 (Willig Expert Report); (PX7132, (Willig Dep.))).

[redacted] Accordingly, Respondents asked the Court to allow them to substitute a new expert to "step into Dr. Willig's shoes." (Mot. for Leave to Substitute a Replacement Expert Witness, 2). The Court granted Respondents' narrow request holding that Respondents may *substitute* a new expert for Dr. Willig. (Order Granting Respondents' Motion for Leave to Substitute a Replacement Expert Witness, 4). Respondents took advantage of this Court's order by designating Dr. Michael Katz who submitted his own expert report and later testified by trial deposition. (*See* PX6105 (Katz Expert Report); RX6004 (Katz Trial Dep.).

Respondents continued reliance on Dr. Willig's expert opinions contravenes this Court's order and prejudices Complaint Counsel as Complaint Counsel has not an opportunity to cross examine this witness at trial in violation of Complaint Counsel's rights under this Court's Rules. *See* Rule 3.41 (c) ("Every party . . .shall have the right of due notice, cross-examination, presentation of evidence, objection, motion, argument, and all other rights essential to a fair hearing."). As such, Respondents' Proposed Finding should be disregarded in its entirety as improper expert opinion.

917. The presence of current and future NGS competitors is significant "in two ways. First, if you could substitute to another company, then that constrains what Illumina can do. . . [Second], [e]ven if you can't switch immediately, the fact that these technologies might be available . . . in the future, you really want to be focusing on not what is possible today, but you . . . really want to be talking about what are the alternatives in the future when the MCED market, to . . . when the MCED industry develops more fully." (RX6000 (Carlton Trial Dep. at 36).)

Response to Finding No. 917

The proposed finding is misleading and contrary to the weight of substantial evidence to the extent Respondents suggest that MCED test developers can switch to another NGS platform currently or will likely be able to in the foreseeable future. First, [redacted] (CCFF ¶¶ 1229-68, 1286-95, 1302-19, 1325-45, 1370-98). Second, [redacted] (CCFF ¶¶ 1286-95, 1302-19, 1325-45, 1370-98, 1613-20, 1646-48, 1677-83, 1717-23). Moreover, there are no NGS platforms in development that are likely to replace Illumina. (CCFF ¶¶ 1724-31).

The proposed finding is also incorrect and contrary to the weight of substantial evidence to the extent it suggests that MCED test developers can readily switch to other NGS platforms. MCED tests are developed to run on a specific NGS platform and switching to another theoretical platform would cause significant delays, require significant costs, and pose regulatory and financial risks for MCED test developers. (CCFF ¶¶ 1768-1901).

The proposed finding is also vague and ambiguous in Dr. Carlton's phrasing of [redacted] The MCED test developers are in the process of innovating and developing competing tests to Grail's Galleri test and theoretical NGS platforms that may be developed when the "industry develops more fully" is ambiguous. At this time, competitors are racing to develop MCED tests and are using Illumina's NGS platform exclusively. (CCFF Section VI.).

Furthermore, no NGS platform is likely to enter the NGS market that would be a viable option for MCED test developers in a timely manner. (CCFF ¶¶ 1576-1731). The Proposed Finding should be disregard for the reasons stated herein and in Responses to RPFF ¶¶ 1934-1946.

918. The presence of upstream NGS alternatives on the market and in development, and the constraints they impose on Illumina, must be taken into account in any economic analysis of Illumina's post-merger incentives and ability to substantially foreclose MCED competition. (*Supra* at [●].)

Response to Finding No. 918

[redacted]

[redacted]

2. **The Evidence Shows Current And Future Upstream Competition.**

919. There are today alternatives to Illumina as a provider of NGS sequencing products and services. (*Supra* PFF ¶¶ 777–779.)

Response to Finding No. 919

The proposed finding is misleading and contrary to the weight of substantial evidence to the extent Respondents suggest that MCED test developers have an alternative NGS platform that they can switch to at this time or in the foreseeable future. The proposed finding is also misleading as it conflates the availability of general NGS alternatives to NGS alternatives that meet the needs of MCED test developers. First, [redacted]. (CCFF ¶¶ 1229-68, 1286-95, 1302-19, 1325-45, 1370-98). [redacted]. (CCFF ¶¶ 1286-95, 1302-19, 1325-45, 1370-98, 1613-20, 1646-48, 1677-83, 1717-23). Furthermore, no NGS platform is likely to enter the NGS market that would be a viable option for MCED test

developers in a timely manner. (CCFF ¶¶ 1576-1731). And there are no NGS platforms in development that are likely to replace Illumina. (CCFF ¶¶ 1724-31). Even if a company develops a new NGS platform, significant barriers to commercialization exist and it will take years for a new entrant to gain the reputation and enough widespread commercial use to be an option to MCED test developers. (CCFF ¶¶ 1527-1575). Therefore, this Court should disregard the proposed finding.

919.1 Suppliers such as Thermo Fisher ONT and Singular are available on the market today and can be used for MCED test development. (*Supra* PFF ¶¶ 778–779.)

Response to Finding No. 919.1

The proposed finding is incomplete, misleading, and against the weight of substantial evidence to the extent Respondents suggest that Thermo Fisher, Oxford Nanopore (ONT), and Singular can be used for MCED test development today. [redacted]

(CCFF ¶¶ 1229-68, 1286-95, 1302-19, 1325-45, 1370-98).

[redacted]

[redacted]

This proposed finding is also incomplete, misleading, and against the weight of substantial evidence to the extent it implies Oxford Nanopore's NGS platform would be a viable alternative for MCED test developers. Oxford Nanopore, and any other long-read NGS platform, is not an option for MCED test developers. [redacted]. (CCFF ¶¶ 1346-1369). [redacted] Further, Dr. Bert Vogelstein of Johns Hopkins University testified that "[l]ong-read sequencers are [ ] unsuited for early detection [cfDNA] liquid biopsy testing" in part because "the throughput of long-read sequencers are much lower than the throughput of short-read sequencers" and "the error rates of long-read sequencers are much too high to effectively analyze the molecules and plasma". (PX7101 (Vogelstein (Johns Hopkins University) Dep. at 65-66)).

This proposed finding is also incomplete, misleading, and against the weight of

substantial evidence to the extent it implies Singular's NGS product in development would be a viable alternative for MCED test developers. [redacted] Singular also represented to its investors that it expects to be sued by Illumina after it launches its G4 platform, which could prevent Singular from commercializing its NGS platform, (CCFF ¶¶ 1668-76), concerns that are echoed by MCED test developers. [redacted]. Singular has also not generated any revenue and expects to incur significant losses in the near term (PX0068 at 35 (Singular Genomics S-1, May 2021)). [redacted] (CCFF ¶¶ 1679-83; *see also* CCFF ¶¶ 1537-55 (describing that MCED customers would not switch to a new NGS platform until it has widespread adoption and demonstrated reliability); CCFF ¶¶ 1556-1566 (gaining widespread

adoption among customers is time consuming and difficult)). Therefore, this Court should disregard the proposed finding.

920. A number of other companies are poised to offer NGS sequencing products and services in the near term. (*Supra* PFF ¶¶ 782–787.)

Response to Finding No. 920

The proposed finding is incomplete, misleading, and against the weight of substantial evidence to the extent Respondents suggest that there are other companies that will offer NGS sequencing products "in the near term" that can be used for MCED test development. [redacted] (CCFF ¶¶ 1229-68, 1286-95, 1302-19, 1325-45, 1370-98). [redacted] CCFF ¶¶ 1286-95, 1302-19, 1325-45, 1370-98, 1613-20, 1646-48, 1677-83, 1717-23).

This proposed finding is also incomplete, misleading, and against the weight of substantial evidence to the extent it implies Singular's NGS product in development would be a viable alternative for MCED test developers. [redacted]

[redacted] Singular also represented to its investors that it expects to be sued by Illumina after it launches its G4 platform, which could prevent Singular from commercializing its NGS platform, (CCFF ¶¶ 1668-76), concerns that are echoed by MCED test developers. [redacted]. Singular has also not generated any revenue and expects to incur significant losses in the near term (PX0068 at 23 (Singular Genomics S-1, May 2021)). In fact, Singular identified as a risk to investors that "we may require substantial additional funding" and substantial additional funding is not available Singular may be required to "delay, scale back, or cease our product development or commercialization activities." (PX0068 at 35 (Singular Genomics S-1, May 2021)). [redacted] (CCFF ¶¶ 1679-83; *see also* CCFF ¶¶ 1537-55 (describing that MCED customers would not switch to a new NGS platform until it has widespread adoption and demonstrated reliability); CCFF ¶¶ 1556-1566 (gaining widespread adoption among customers is time consuming and difficult)).

[redacted]

[redacted]

[redacted]

Furthermore, no NGS platform is likely to enter the NGS market that would be a viable option for MCED test developers in a timely manner. (CCFF ¶¶ 1576-1731). And there are no NGS platforms in development that are likely to replace Illumina. (CCFF ¶¶ 1724-31). Even if a company develops and launches a new NGS platform, significant barriers to commercialization exist and it will take years for a new entrant to gain the reputation and enough widespread commercial use to be considered as an option to MCED test developers. (CCFF ¶¶ 1527-1575). Therefore, this Court should disregard the proposed finding.

921. There is substantial evidence that MCED test developers will have many commercially viable NGS options within the next few years, before most, if not all, MCED tests in development are ready for commercial launch. (*Supra* PFF ¶¶ 782–787.)

Response to Finding No. 921

The proposed finding is egregiously misleading, ambiguous, and against the weight of substantial evidence demonstrating that MCED test developers will not have any commercially viable NGS options within the next few years. The proposed finding is misleading to the extent that is suggests that MCED tests do not rely on NGS sequencers prior to commercialization. The proposed finding is ambiguous because "commercially viable NGS options" is not defined and the fact that a new NGS platform may launch does not mean it is applicable for MCED test developers. (CCFF ¶¶ 1576-1731). Substantial evidence demonstrates that no NGS platform is likely to enter the NGS market that would be a viable option for MCED test developers in a timely manner. (CCFF ¶¶ 1576-1731). And there are no NGS platforms in development that are

likely to replace Illumina. (CCFF ¶¶ 1724-31).

The proposed finding is also highly misleading because it implies that MCED test developers can easily switch to a new NGS platform if, and/or when, one launches. Switching to another hypothetical NGS platform would cause significant delays, require significant costs, and pose serious regulatory and financial risks for MCED test developers. (CCFF ¶¶ 1768-1901).

[redacted] Moreover, even if a company develops and launches a new NGS platform, significant barriers to commercialization exist and it will take years for a new entrant to gain the reputation and enough widespread commercial use to be considered as an option to MCED test developers. (CCFF ¶¶ 1527-1575); *see also* Response to RPFF ¶ 920. Therefore, this Court should disregard the proposed finding.

922. For example, BGI will enter the U.S. market not long after Illumina's patents that underlie the injunction against BGI's entry expire in 2023, and it is undisputed that BGI's technology is comparable to Illumina's NGS systems in terms of throughput, accuracy, turnaround time and cost. (*Supra* PFF ¶¶ 777.)

Response to Finding No. 922

[redacted]

[redacted]

923. There are hundreds of millions of dollars being invested to fund these NGS innovators, many of which are specifically targeting the screening (and other oncology) segments and have disclosed roadmaps that project commercial launch within the next few years—and in the case of Singular, late last year. (*Supra* PFF ¶¶ 782–787; Velarde (Singular) Tr. 4515–16 ("we're going to be commercially launching at the end of [2021] and shipping systems in the first half of next year").)

Response to Finding No. 923

The proposed finding is incomplete, highly misleading, and against the weight of substantial evidence to the extent Respondents suggest that the investment into NGS innovators will result in an alternative NGS platform for MCED test developers that would be timely, likely, and sufficient. Substantial evidence demonstrates that no NGS platform is likely to enter the NGS market that would be a viable option for MCED test developers in a timely manner. (CCFF ¶¶ 1576-1731). And there are no NGS platforms in development that are likely to replace Illumina. (CCFF ¶¶ 1724-31).

The proposed finding is also highly misleading because it implies that MCED test

developers can easily switch to a new NGS platform if, and/or when, one launches. Switching to another hypothetical NGS platform would cause significant delays, require significant costs, and pose serious regulatory and financial risks for MCED test developers. (CCFF ¶¶ 1768-1901).

[redacted] Moreover, even if a company develops and launches a new NGS platform, significant barriers to commercialization exist and it will take years for a new entrant to gain the reputation and enough widespread commercial use to be considered as an option to MCED test developers. (CCFF ¶¶ 1527-1575); *see also* Response to RPFF ¶ 920. Therefore, this Court should disregard the proposed finding.

> 923.1 A number of these innovators are led by former Illumina executives, who are extremely knowledgeable about the industry and what it takes to succeed. Moreover, in speculating that all of these well-funded, serious players will simply fail, Complaint Counsel adopts an entirely inconsistent position on the evidence. (*Supra* PFF ¶¶ 782–787, 789.)

Response to Finding No. 923.1

[redacted]

[redacted]

924. Numerous Illumina executives testified about their expectations for NGS competition, including with the expiration of key patents in 2023, and how that dynamic impacts Illumina's strategies. (PFF ¶¶ 924.1–924.3.)

Response to Finding No. 924

The proposed finding is misleading, unreliable, and inherently speculative. For support, Respondents cite only to unfounded, self-serving testimony of Illumina executives that is uncorroborated by any ordinary course documents or analysis. Given the inherent unreliability of this testimony as well as lack of foundation or explanation for the executives' conjectures, this proposed finding of fact should be disregarded. The weight of substantial evidence is clear that there are no likely entrants that can serve as an alternative to MCED test developers, and even if there was a potential entrant, the switching costs and significant barriers to commercialization are enormous. *See, e.g.*, Responses to RPFF ¶¶ 919-923. Specifically, Respondents ordinary course documents show that Illumina is already seeking *additional injunctive relief* against BGI based on U.S. patents that do not expire until 2027 and may assert additional patents against BGI that run beyond 2027. (CCFF ¶¶ 1276-1285). Therefore, this Court should disregard the proposed finding.

924.1 [redacted]

Response to Finding No. 924.1

[redacted]

924.2 Ms. Berry testified that "there are numerous competitors already participating in the genomics space with instruments and consumables similar to ours", and "we anticipate that that competitive environment will . . . only become more intensive over time." (Berry (Illumina) Tr. 813).

Response to Finding No. 924.2

The proposed finding is misleading, inherently speculative, and against the weight of the evidence. For support, Respondents cite to Mr. Berry's unfounded, self-serving testimony as an Illumina executive that is uncorroborated by any ordinary course documents or analysis. Given the inherent unreliability of this testimony as well as lack of foundation or explanation for this executive's conjecture, this proposed finding of fact should be disregarded.

The proposed finding is misleading and against the weight of substantial evidence to the extent Respondents suggest that there are alternative NGS platforms comparable to Illumina "already participating in the genomics space" or that the "competitive environment" for such platforms will "become more intensive over time" for MCED test developers. First, the mere potential of a new NGS platform does not at all suggest that these potential entrants will serve as a viable alternative specifically to MCED test developers. The voluminous record evidence demonstrates that no NGS platform is likely to enter the NGS market that would be a viable option for MCED test developers in a timely manner. (CCFF ¶¶ 1576-1731). [redacted] Moreover, even if a company develops and launches a new NGS platform, significant barriers to commercialization exist and it will take years for a new entrant to gain the reputation and enough widespread commercial use to be considered as an option to MCED test developers. (CCFF ¶¶ 1527-1575); *see also* Response to

RPFF ¶ 920. Therefore, this Court should disregard the proposed finding.

> 924.3 Dr. Aravanis similarly testified that there will be "many new sequencing platforms, so a tremendous intensification of competition" and "there will be even more platforms in the coming years." (Aravanis (Illumina) Tr. 1866).

Response to Finding No. 924.3

The proposed finding is misleading, inherently speculative, and against the substantial weight of the evidence. For support, Respondents cite to Dr. Aravanis's unfounded, self-serving testimony as an Illumina executive that is uncorroborated by any ordinary course documents or analysis. Given the inherent unreliability of this testimony as well as lack of foundation or explanation for this executive's conjecture, this proposed finding of fact should be disregarded. In addition, the proposed finding is misleading because the testimony is not specific to NGS platforms that can be used as an alternative to Illumina's NGS platform for MCED test developers.

The proposed finding is misleading and against the substantial weight of the evidence to the extent Respondents suggest that there will be "many new sequencing platforms" comparable to Illumina's NGS platforms or that such platforms will be applicable for MCED test developers. First, the mere potential of a new NGS platform does not at all suggest that these potential entrants will serve as a viable alternative specifically to MCED test developers. The voluminous record evidence demonstrates that no NGS platform is likely to enter the NGS market that would be a viable option for MCED test developers in a timely manner. (CCFF ¶¶ 1576-1731). And there are no NGS platforms in development that are likely to replace Illumina. (CCFF ¶¶ 1724-31). [redacted]

[redacted] Therefore, this Court should disregard the proposed finding.

924.4 Dr. Aravanis identified a number of sequencing platforms on the market today and in development that would be viable platforms for an MCED test such as Galleri. (Aravanis (Illumina) Tr. 1848–63.)

Response to Finding No. 924.4

The proposed finding is incomplete, misleading, inherently speculative, and against the weight of substantial evidence. For support, Respondents cite to Dr. Aravanis's unfounded, self-serving testimony as an Illumina executive that is uncorroborated by any ordinary course documents or analysis. Given the inherent unreliability of this testimony as well as lack of foundation or explanation for this executive's conjecture, this proposed finding of fact should be disregarded.

The proposed finding is incomplete, misleading, and against the weight of substantial evidence to the extent Respondents suggest that the [redacted]

[redacted]

925. Furthermore, it is well accepted that sequencing technology is becoming substantially cheaper every year – it is thus substantially likely that all existing and future sequencing options will improve and become cheaper over time. (PFF ¶ 22.)

Response to Finding No. 925

[redacted]

[redacted]

926. Complaint Counsel infers from the mere fact of "excitement" and "investment" in downstream test development that it is "highly likely that there are going to be several successful cancer tests" in the alleged MCED market. (RX3852 (Scott Morton Dep. at 112).) There is no basis to accept that MCED test developers will be successful and compete with Galleri, yet the upstream alternatives to Illumina in development are too uncertain to predict their likely success. (RX6000 (Carlton Trial Dep. at 37–38).)

Response to Finding No. 926

The proposed finding is incomplete, egregiously misleading, and against the weight of substantial evidence to the extent Respondents suggest that Grail's competitors are not racing to develop MCED tests, are not likely to compete with Grail, and that there are likely upstream alternatives to Illumina that will be available for MCED test developers. In addition, this proposed finding is inherently speculative. For support, Respondents cite only to the paid testimony of Dr. Carlton's that is uncorroborated by any ordinary course documents or analysis. Given the inherent unreliability of this testimony as well as lack of foundation or explanation for the expert's conjecture, this proposed finding of fact should be disregarded under this Court's prior order.

Complaint Counsel does not infer that it is "highly likely that there are going to be several successful cancer tests" in the MCED test market solely on the basis of "excitement" and "investment" in MCED tests. [redacted]

Instead, the record shows that MCED test developers are not merely beginning the race towards commercialization of an MCED test but are well on their way towards the finish line. Specifically, MCED test developers have already invested millions of dollars and years of

research into their MCED tests. [redacted]

[redacted] Therefore, this Court should disregard the proposed finding.

926.1 As Dr. Carlton put it:

> "[A]ll I can do is point out the asymmetry in [the government's expert's] analysis. None of the MCED products that [Dr. Scott Morton is] talking about exist. . . . All of them are in the future and some, as I read the evidence, far in the future. In contrast, when she's evaluating NGS alternatives to Illumina, even though those seem from the evidence to be more readily available and likely, she dismisses them. So I agree it's hard to make predictions, very hard, as to who will be an actual competitor in the future. That's true both for MCED and NGS, and she takes a very asymmetric stance in which she assumes that the MCED products are going to come into existence, but the NGS alternatives to Illumina are not."

(RX6000 (Carlton Trial Dep. at 37–38).)

Response to Finding No. 926.1

This proposed finding is inherently speculative and egregiously incomplete, misleading, and against the weight of substantial evidence. For support, Respondents cite only to the paid testimony of Dr. Carlton that is uncorroborated by any ordinary course documents or analysis. Given the inherent unreliability of this testimony as well as lack of foundation or explanation for his unsupported conjecture, this proposed finding of fact should be disregarded.

[redacted]

[redacted]

Instead, the record shows that MCED test developers are not merely beginning the race towards commercialization of an MCED test but are well on their way towards the finish line. Specifically, MCED test developers have already invested millions of dollars and years of research into their MCED tests. [redacted]. And, despite Respondents' misrepresentations to the contrary, several of these MCED test developers are poised to cross the finish line and launch an MCED test imminently. [redacted]

[redacted]

3. The FTC's Theory Is Belied by Investment Activity Before and Since the Announcement of the GRAIL Merger Agreement

927. Numerous companies have been investing in the liquid biopsy early cancer detection space, since both before and after Illumina announced its agreement to acquire GRAIL. (RX3871 (Willig Expert Report) ¶¶ 50–51.)

Response to Finding No. 927

The proposed finding should be disregarded as violating this Court's order. This Court ordered that experts shall not be cited to "support factual propositions that should be established

by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Dr. Willig as the only source of evidence supporting the fact in contravention of this Court's Order. This Court should disregard this evidence.

Complaint Counsel objects to this proposed finding as improper expert testimony offered in contravention of this Court's order. Dr. Willig submitted an expert report as well as deposition testimony. (*See,* (RX3871 (Willig Expert Report); (PX7132, (Willig Dep.))). [redacted] Accordingly, Respondents asked the Court to allow them to substitute a new expert to "step into Dr. Willig's shoes." (Mot. for Leave to Substitute a Replacement Expert Witness, 2). The Court granted Respondents' narrow request holding that Respondents may *substitute* a new expert for Dr. Willig. (Order Granting Respondents' Motion for Leave to Substitute a Replacement Expert Witness, 4). Respondents took advantage of this Court's order by designating Dr. Michael Katz who submitted his own expert report and later testified by trial deposition. (*See* PX6105 (Katz Expert Report); RX6004 (Katz Trial Dep.).

Respondents continued reliance on Dr. Willig's expert opinions contravenes this Court's order and prejudices Complaint Counsel as Complaint Counsel has not an opportunity to cross examine this witness at trial in violation of Complaint Counsel's rights under this Court's Rules. *See* Rule 3.41 (c) ("Every party . . . shall have the right of due notice, cross-examination, presentation of evidence, objection, motion, argument, and all other rights essential to a fair hearing."). As such, Respondents' Proposed Finding should be disregarded in its entirety as improper expert opinion.

The proposed finding is also misleading to the extent it implies that the pre-Acquisition investment indicates that MCED tests developers have alternatives to Illumina. [redacted]

Finally, the proposed finding is against the weight of the evidence. [redacted] Therefore, this Court should disregard the proposed finding.

928. Shortly after the merger was announced, analysts predicted that the deal would accelerate investment and innovation in the space, with one observing that "the recent acquisition of GRAIL by ILMN has catalyzed the excitement in the market to new highs – even ahead of our prior expectations", and "there is an expectation that more companies will increasingly pursue liquid biopsy screening as ILMN's acquisition of pre-revenue GRAIL has 'validated' the liquid biopsy early detection theses." (RX1096 (SVBLeerink) at 3.)

Response to Finding No. 928

The proposed finding is incomplete, vague, speculative, and misleading. The proposed finding is vague because "investment and innovation in the space" does not define which space it is referring to and does not necessarily refer to MCED test development. The proposed finding is incomplete and speculative, and thus should be disregarded, because Respondents cite to a *single* analyst report for the proposition that Illumina's acquisition of Grail will result in more companies pursuing liquid biopsy screening and/or MCED tests.

The proposed finding is also misleading to the extent Respondents suggest that

investment in other MCED test developers post-announcement of the Illumina/Grail transaction is indicative that Illumina would not have the ability and incentive to foreclose Grail's rivals or otherwise raise those rivals' costs post-transaction. [redacted]

[redacted]

The proposed finding also should be disregarded as it is based on unreliable hearsay. Respondents cite only an out-of-court statement of investors for this fact but choose to not to call any of the investors at trial to provide context or an indicia of reliability. Therefore, this Court should disregard the proposed finding.

929. Investment has in fact poured into cancer test development since the time Illumina announced its agreement to acquired GRAIL. (RX3871 (Willig Expert Report) ¶ 50.)

Response to Finding No. 929

The proposed finding is vague, misleading, irrelevant, unsupported, and against the weight of the evidence. The finding is vague given that it is unclear what is meant by "cancer test development". Moreover, the finding is irrelevant: [redacted]

Complaint Counsel objects to this proposed finding as improper expert testimony offered in contravention of this Court's order. Dr. Willig submitted an expert report as well as deposition testimony. (*See,* (RX3871 (Willig Expert Report); (PX7132, (Willig Dep.))). [redacted] Accordingly, Respondents asked the Court to allow them to substitute a

new expert to "step into Dr. Willig's shoes." (Mot. for Leave to Substitute a Replacement Expert Witness, 2). The Court granted Respondents' narrow request holding that Respondents may *substitute* a new expert for Dr. Willig. (Order Granting Respondents' Motion for Leave to Substitute a Replacement Expert Witness, 4). Respondents took advantage of this Court's order by designating Dr. Michael Katz who submitted his own expert report and later testified by trial deposition. (*See* PX6105 (Katz Expert Report); RX6004 (Katz Trial Dep.).

Respondents continued reliance on Dr. Willig's expert opinions contravenes this Court's order and prejudices Complaint Counsel as Complaint Counsel has not an opportunity to cross examine this witness at trial in violation of Complaint Counsel's rights under this Court's Rules. *See* Rule 3.41 (c) ("Every party . . . shall have the right of due notice, cross-examination, presentation of evidence, objection, motion, argument, and all other rights essential to a fair hearing."). As such, Respondents' Proposed Finding should be disregarded in its entirety as improper expert opinion.

Finally, as Complaint Counsel explained, the overwhelming weight of the evidence shows that [redacted]. Therefore, this Court should disregard the proposed finding.

> 929.1 For example, approximately one month after Illumina announced its agreement to acquire GRAIL, Exact entered into an agreement acquire Thrive for over $2 billion, and completed the acquisition approximately four months after Illumina announced its agreement to acquire GRAIL. (RX3196 (Exact) at 1.)

Response to Finding No. 929.1

The proposed finding is misleading to the extent Respondents suggest that Exact's acquisition of Thrive after the announcement of the Illumina/Grail transaction is indicative that Illumina would not have the ability and incentive to foreclose Grail's rivals or otherwise raise

those rivals' costs post-transaction. [redacted]

[redacted] Therefore, this Court should disregard the proposed finding.

929.2 [redacted]

Response to Finding No. 929.2

[redacted]

[redacted]

[redacted]

[redacted]

[redacted]

929.3 As another example, in December 2020, Singlera obtained $150 million in financing, which it planned to utilize "mainly to expand the company's early cancer screening product research and development pipeline and focus on promoting product registration and commercialization, as well as expanding prospective studies into pan-cancer early screening." (RX3633 (PR Newswire) at 1); [redacted]

Response to Finding No. 929.3

The proposed finding is based only on out-of-court hearsay that has no indicia of reliability as well as an impermissible factual citation to an expert report. This proposed finding should be disregarded based on that alone. The proposed finding is misleading to the extent Respondents suggest that Singlera's $150 million in additional financing after the announcement of the Illumina/Grail transaction is indicative that Illumina would not have the ability and incentive to foreclose Grail's rivals or otherwise raise those rivals' costs post-transaction. [redacted]

[redacted]

[redacted]

930. As Mr. deSouza observed, in addition to Thrive's acquisition of Exact, other liquid biopsy companies experienced large rounds of investments after Illumina announced its agreement to acquire GRAIL, including a significant increase in investment in the early cancer detection space. (deSouza (Illumina) Tr. 2392–93.)

Response to Finding No. 930

The proposed finding is misleading to the extent Respondents suggest that a "significant increase in investment in the early cancer detect space" after the announcement of the Illumina/Grail transaction is indicative that Illumina would not have the ability and incentive to foreclose Grail's rivals or otherwise raise those rivals' costs post-transaction. [redacted]

[redacted]

[redacted]

930.1 This "was very consistent with what we saw in the noninvasive prenatal testing space [another downstream testing space, discussed below, that Illumina entered through a vertical merger and that is now thriving competitively] when we entered in 2013 – investment increased there too." (deSouza (Illumina) Tr. 2392–93.)

Response to Finding No. 930.1

The proposed finding relies solely upon the self-serving testimony of Illumina's CEO, Francis deSouza, to assert that Illumina's acquisition of Verinata resulted in increased investment in the NIPT market. This proposed finding should be disregarded as Respondents only cite to self-serving testimony of Mr. deSouza that is uncorroborated by any ordinary course documents or analysis.

[redacted]

[redacted]

931. Firms raised capital at least partly directed towards the development of NGS-based cancer screening tests after Illumina announced in September 2020 that it would be acquiring GRAIL, signaling an expectation that Illumina's alleged ability and incentive to increase prices or diminish its service to firms that are developing NGS-based cancer screening tests will be constrained. (RX3871 (Willig Expert Report) ¶ 51, n.104) (citing (RX3015 (GlobeNewswire) at 1); (RX3075 (BusinessWire) at 1); (RX3170 (PR Newswire) at 1).)

Response to Finding No. 931

The proposed finding is misleading, irrelevant, unsupported, and against the weight of the

evidence. [redacted]

Complaint Counsel objects to this proposed finding as improper expert testimony offered in contravention of this Court's order. Dr. Willig submitted an expert report as well as deposition testimony. (*See,* (RX3871 (Willig Expert Report); (PX7132, (Willig Dep.))). [redacted] Accordingly, Respondents asked the Court to allow them to substitute a new expert to "step into Dr. Willig's shoes." (Mot. for Leave to Substitute a Replacement Expert Witness, 2). The Court granted Respondents' narrow request holding that Respondents may *substitute* a new expert for Dr. Willig. (Order Granting Respondents' Motion for Leave to Substitute a Replacement Expert Witness, 4). Respondents took advantage of this Court's order by designating Dr. Michael Katz who submitted his own expert report and later testified by trial deposition. (*See* PX6105 (Katz Expert Report); RX6004 (Katz Trial Dep.).

Respondents continued reliance on Dr. Willig's expert opinions contravenes this Court's order and prejudices Complaint Counsel as Complaint Counsel has not an opportunity to cross examine this witness at trial in violation of Complaint Counsel's rights under this Court's Rules. *See* Rule 3.41 (c) ("Every party . . . shall have the right of due notice, cross-examination, presentation of evidence, objection, motion, argument, and all other rights essential to a fair hearing."). As such, Respondents' Proposed Finding should be disregarded in its entirety as

improper expert opinion.

Respondents provide two other sources to support their contention, RX3170 and RX3075. Respondents did not depose or call either investment firm to testify at trial and to explain why each firm invested in early cancer detection companies. Without that context, these articles are not probative as to each investment firms' motivations for investing, understanding of the MCED industry, or expectations regarding this enforcement action. As such, the proposed finding should be disregarded as unsupported by any cited source.

The proposed finding is misleading to the extent Respondents suggest that investment in companies developing MCEDs after the announcement of the Illumina/Grail transaction is indicative that Illumina would not have the ability and incentive to foreclose Grail's rivals or otherwise raise those rivals' costs post-transaction. [redacted]

[redacted]

Finally, as Complaint Counsel explained, the overwhelming weight of the evidence shows that [redacted]

932. The timing and amount of investment activity in cancer test development is directly contrary to Complaint Counsel's speculation that the merger will disincentivize investment in NGS cancer screening.

Response to Finding No. 932

First, the proposed finding should be disregarded because it is entirely unsupported and lacks any citation to the record. Second, the proposed finding is incomplete and misleading to the extent [redacted] Therefore, the proposed finding should be disregarded.

933. The timing and amount of investment activity in cancer test development is directly contrary is also inconsistent with Complaint Counsel's claim that test developers are "captive" to Illumina and locked in to Illumina platforms with no options even if Illumina disadvantaged their tests. According to Complaint Counsel, customers are and will remain locked into Illumina's NGS platform, they would have no choice but to pay the higher price demanded by Illumina. This concept is commonly referred to by economists as the "hold-up problem." (RX3871 (Willig Expert Report) ¶ 52.)

Response to Finding No. 933

The proposed finding is misleading, irrelevant, unsupported, and against the weight of the evidence. The finding is irrelevant: [redacted]

Moreover, the proposed finding is misleading to the extent Respondents suggest that investment after the announcement of the Illumina/Grail transaction is indicative that Illumina would not have the ability and incentive to foreclose Grail's rivals or otherwise raise those rivals' costs post-transaction. [redacted]

[redacted]

The proposed finding is also unsupported given the only source is Dr. Willig's improper expert testimony offered in contravention of this Court's order. Dr. Willig submitted an expert report as well as deposition testimony. (*See,* (RX3871 (Willig Expert Report); (PX7132, (Willig Dep.))). [redacted] Accordingly, Respondents asked the Court to allow them to substitute a new expert to "step into Dr. Willig's shoes." (Mot. for Leave to Substitute a Replacement Expert Witness, 2). The Court granted Respondents' narrow request holding that Respondents may *substitute* a new expert for Dr. Willig. (Order Granting Respondents' Motion for Leave to

Substitute a Replacement Expert Witness, 4). Respondents took advantage of this Court's order by designating Dr. Michael Katz who submitted his own expert report and later testified by trial deposition. (*See* PX6105 (Katz Expert Report); RX6004 (Katz Trial Dep.).

Respondents continued reliance on Dr. Willig's expert opinions contravenes this Court's order and prejudices Complaint Counsel as Complaint Counsel has not an opportunity to cross examine this witness at trial in violation of Complaint Counsel's rights under this Court's Rules. *See* Rule 3.41 (c) ("Every party . . . shall have the right of due notice, cross-examination, presentation of evidence, objection, motion, argument, and all other rights essential to a fair hearing."). As such, Respondents' Proposed Finding should be disregarded in its entirety as improper expert opinion. Given that Respondents have not provided the support of their substituted expert – Dr. Katz – or any other fact witnesses, this testimony is unsupported and should be disregarded.

Finally, as Complaint Counsel explained, the overwhelming weight of the evidence shows that [redacted]. Therefore, this Court should disregard the proposed finding.

934. However, the substantial investment in liquid biopsy cancer test development on Illumina's platform, by itself, refutes the notion that MCED test developers are indefinitely locked into Illumina's platform or that they fear Illumina can impede their test development efforts. (RX6004 (Katz Trial Dep. at 43–44).)

Response to Finding No. 934

First, this Court held that experts shall not be cited to "support factual proposition that should be established by fact witnesses or documents." Here, Respondents cite Dr. Katz in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3. As such, this Court should disregard this proposed finding.

Second, Complaint Counsel objects to Respondents' proposed finding to the extent it endorses the biased and inherently unreliable opinion testimony of Dr. Katz. Dr. Katz normally spends approximately three to four hundred hours preparing for an expert report in a matter. (RX6004 (Katz Trial Dep. at 135-136)). Here, Dr. Katz only billed forty to fifty hours. (RX6004 (Katz Trial Dep. at 137)). In total, Dr. Katz allegedly considered over 6,533 pages of material in approximately forty to fifty hours. (RX6004 (Katz Trial Dep. at 137-141)). In effect, this means that he spent approximately less than half a minute per page in reviewing the materials listed on his materials considered list. (PX6105 (Katz Expert Report) at 017-023). Given his cursory review of the record, his opinion in this case is inherently unreliable and should be disregarded.

Moreover, Dr. Katz violated this Court's order to confine his testimony to Dr. Willig's report and the basis for his opinion contained therein. (Order Granting Respondents' Motion for Leave to Substitute a Replacement Expert Witness, 4) ("The substitute expert witness' trial testimony shall be limited to the opinions, bases or reasons therefor, and the data or other information considered or relied upon by Dr. Willig, as set forth in Dr. Willig's expert witness report."); [redacted] Given the unreliable nature of Dr. Katz's opinion as well as Respondents' complete disregard of this Court's order, Dr. Katz's opinion should be disregarded.

The proposed finding should also be disregarded because Dr. Katz himself did not conduct any actual assessment of investments in the liquid biopsy or MCED development

industry. In particular, Dr. Katz testified at his trial deposition that he did not conduct an assessment of investments in the biotech industry generally or among MCED test developers individually. (RX6004 (Katz Trial Dep. at 140-141)). Further, Dr. Katz did not communicate with any investors as to their rationale for investing in the liquid biopsy and MCED companies. (RX6004 (Katz Trial Dep. at 141)).

[redacted]

935. That is because it would be economically irrational for firms to make such large investments if they truly anticipated that they would have no options or opportunities to switch by the time their tests are commercialized and earning profits. (RX6004 (Katz Trial Dep. at 43–44).)

Response to Finding No. 935

Complaint Counsel objects to Respondents' proposed finding to the extent it endorses the biased and inherently unreliable opinion testimony of Dr. Katz. Dr. Katz normally spends approximately three to four hundred hours preparing for an expert report in a matter. (RX6004 (Katz Trial Dep. at 135-136)). Here, Dr. Katz only billed forty to fifty hours. (RX6004 (Katz Trial Dep. at 137)). In total, Dr. Katz allegedly considered over 6,533 pages of material in approximately forty to fifty hours. (RX6004 (Katz Trial Dep. at 137-141)). In effect, this means that he spent approximately less than half a minute per page in reviewing the materials listed on his materials considered list. (PX6105 (Katz Expert Report) at 017-023). Given his cursory review of the record, his opinion in this case is inherently unreliable and should be disregarded.

Moreover, Dr. Katz violated this Court's order to confine his testimony to Dr. Willig's report and the basis for his opinion contained therein. (Order Granting Respondents' Motion for Leave to Substitute a Replacement Expert Witness, 4 ("The substitute expert witness' trial testimony shall be limited to the opinions, bases or reasons therefor, and the data or other information considered or relied upon by Dr. Willig, as set forth in Dr. Willig's expert witness

report.”); [redacted]

[redacted] Given the unreliable nature of Dr. Katz’s opinion as well as Respondents’ complete disregard of this Court’s order, Dr. Katz’s opinion should be disregarded.

The proposed finding should also be disregarded because Dr. Katz himself did not conduct any actual assessment of investments in the liquid biopsy or MCED development industry. In particular, Dr. Katz testified at his trial deposition that he did not conduct an assessment of investments in the biotech industry generally or among MCED test developers individually. (RX6004 (Katz Trial Dep. at 140-141)). Further, Dr. Katz did not communicate with any investors as to their rationale for investing in the liquid biopsy and MCED companies. (RX6004 (Katz Trial Dep. at 141)).

[redacted]

[redacted]

936. Otherwise, these firms would be knowingly subjecting themselves to opportunistic hold-up, since (if Complaint Counsel's long-term monopoly theory had merit) Illumina would have both an incentive and ability to extract all their returns, even *without* the GRAIL merger. (RX6004 (Katz Trial Dep. at 43–44); RX3871 (Willig Expert Report) ¶¶ 52–54.)

Response to Finding No. 936

The proposed finding is misleading, against the weight of the evidence, and should be disregarded based on the unsupported, speculative testimony from Dr. Katz and Dr. Willig. [redacted] The proposed finding is misleading to the extent Respondents suggest that a investment after the announcement of the Illumina/Grail transaction is indicative that Illumina would not have the ability and incentive to foreclose Grail's rivals or otherwise raise those rivals' costs post-transaction. [redacted]

[redacted]

936.1 [redacted]

Response to Finding No. 936.1

[redacted]

The proposed finding is misleading to the extent Respondents suggest that investment after the announcement of the Illumina/Grail transaction is indicative that Illumina would not have the ability and incentive to foreclose Grail's rivals or otherwise raise those rivals' costs post-transaction. [redacted]

[redacted]

The proposed finding is also irrelevant: [redacted]

[redacted] Therefore, this Court should disregard the proposed finding.

Response to Finding No. 936.4

[redacted]

[redacted]

937. The investment activity by these Illumina customers are a compelling market signal—one backed by large sums of money, not just words—that NGS-based test developers expect that competition will powerfully constrain Illumina's ability and incentive to increase prices or diminish its service to firms that are developing NGS-based cancer screening tests. (RX3871 (Willig Expert Report) ¶ 57.)

Response to Finding No. 937

The proposed finding is misleading, irrelevant, unsupported, and against the weight of the

evidence. The finding is irrelevant: [redacted]

The proposed finding is also unsupported given the only source is Dr. Willig's improper expert testimony offered in contravention of this Court's order. Dr. Willig submitted an expert report as well as deposition testimony. (*See,* (RX3871 (Willig Expert Report); (PX7132, (Willig Dep.))). [redacted] Accordingly, Respondents asked the Court to allow them to substitute a new expert to "step into Dr. Willig's shoes." (Mot. for Leave to Substitute a Replacement Expert Witness, 2). The Court granted Respondents' narrow request holding that Respondents may *substitute* a new expert for Dr. Willig. (Order Granting Respondents' Motion for Leave to Substitute a Replacement Expert Witness, 4). Respondents took advantage of this Court's order by designating Dr. Michael Katz who submitted his own expert report and later testified by trial deposition. (*See* PX6105 (Katz Expert Report); RX6004 (Katz Trial Dep.).

Respondents continued reliance on Dr. Willig's expert opinions contravenes this Court's order and prejudices Complaint Counsel as Complaint Counsel has not an opportunity to cross examine this witness at trial in violation of Complaint Counsel's rights under this Court's Rules. *See* Rule 3.41 (c) ("Every party . . . shall have the right of due notice, cross-examination, presentation of evidence, objection, motion, argument, and all other rights essential to a fair hearing."). As such, Respondents' Proposed Finding should be disregarded in its entirety as

improper expert opinion. Given that Respondents have not provided the support of their substituted expert – Dr. Katz – or any other fact witnesses, this testimony is unsupported and should be disregarded.

The proposed finding is misleading to the extent it implies that post-acquisition investment indicates that Illumina does not have the ability or incentive to foreclose Grail's rivals. [redacted]

[redacted]

The proposed finding is also misleading to the extent it implies that the pre-Acquisition investment indicates that MCED tests developers have alternatives to Illumina. [redacted]

Finally, as Complaint Counsel explained, the overwhelming weight of the evidence shows that [redacted]. Therefore, this Court should disregard the proposed finding.

938. Even after Illumina announced in September 2020 that it would be acquiring GRAIL, the marketplace continued to show strong signals that Illumina's alleged ability and incentive to increase prices or diminish its service to firms that are developing NGS-based cancer screening tests will be constrained, as evidenced by the investment activity occurring after the announcement. (RX3871 (Willig Expert Report) ¶ 58.)

Response to Finding No. 938

The proposed finding is misleading, irrelevant, unsupported, and against the weight of the evidence. The finding is irrelevant: [redacted]

The proposed finding is also unsupported given the only source is Dr. Willig's improper

expert testimony offered in contravention of this Court's order. Dr. Willig submitted an expert report as well as deposition testimony. (*See,* (RX3871 (Willig Expert Report); (PX7132, (Willig Dep.))). [redacted] Accordingly, Respondents asked the Court to allow them to substitute a new expert to "step into Dr. Willig's shoes." (Mot. for Leave to Substitute a Replacement Expert Witness, 2). The Court granted Respondents' narrow request holding that Respondents may *substitute* a new expert for Dr. Willig. (Order Granting Respondents' Motion for Leave to Substitute a Replacement Expert Witness, 4). Respondents took advantage of this Court's order by designating Dr. Michael Katz who submitted his own expert report and later testified by trial deposition. (*See* PX6105 (Katz Expert Report); RX6004 (Katz Trial Dep.).

Respondents continued reliance on Dr. Willig's expert opinions contravenes this Court's order and prejudices Complaint Counsel as Complaint Counsel has not an opportunity to cross examine this witness at trial in violation of Complaint Counsel's rights under this Court's Rules. *See* Rule 3.41 (c) ("Every party . . . shall have the right of due notice, cross-examination, presentation of evidence, objection, motion, argument, and all other rights essential to a fair hearing."). As such, Respondents' Proposed Finding should be disregarded in its entirety as improper expert opinion. Given that Respondents have not provided the support of their substituted expert – Dr. Katz – or any other fact witnesses, this testimony is unsupported and should be disregarded.

The proposed finding is also misleading to the extent that Respondents are implying that post-Acquisition Respondents will not have the ability and incentive to disadvantage Grail's

rivals. [redacted]

Finally, as Complaint Counsel explained, the overwhelming weight of the evidence shows that [redacted]. Therefore, this Court should disregard the

proposed finding.

938.1 [redacted]

Response to Finding No. 938.1

[redacted]

[redacted]

938.2 In other words, even without the merger, economic logic states that, if (contrary to fact) Illumina were a long-term monopolist of NGS platforms for MCED development, it would extract all the profits by raising prices of NGS inputs once the downstream developers have "invented the relevant technology." (RX6004 (Katz Trial Dep. at 43–44); RX3852 (Scott Morton Dep. at 171).)

Response to Finding No. 938.2

The proposed finding is irrelevant, unsupported by the factual record, misleading, and contrary to the weight of the evidence. [redacted]

The proposed finding is also misleading to the extent it implies that the pre-Acquisition investment indicates that MCED tests developers have alternatives to Illumina. [redacted]

[redacted]

Finally, as Complaint Counsel explained, the overwhelming weight of the evidence shows that [redacted]. Therefore, this Court should disregard the proposed finding.

939. The substantial investment in NGS-based tests indicates that Complaint Counsel's long-term monopoly theory is unfounded. (RX6004 (Katz Trial Dep. at 43–44); (RX3871 (Willig Expert Report) ¶ 50.))

Response to Finding No. 939

Complaint Counsel objects to Respondents' proposed finding to the extent it endorses the biased and inherently unreliable opinion testimony of Dr. Katz. Dr. Katz normally spends approximately three to four hundred hours preparing for an expert report in a matter. (RX6004 (Katz Trial Dep. at 135-136)). Here, Dr. Katz only billed forty to fifty hours. (RX6004 (Katz Trial Dep. at 137)). In total, Dr. Katz allegedly considered over 6,533 pages of material in approximately forth to fifty hours. (RX6004 (Katz Trial Dep. at 137-141)). In effect, this means that he spent approximately less than half a minute per page in reviewing the materials listed on his materials considered list. (PX6105 (Katz Expert Report) at 017-023). Given his cursory review of the record, his opinion in this case is inherently unreliable and should be disregarded.

Moreover, Dr. Katz violated this Court's order to confine his testimony to Dr. Willig's report and the basis for his opinion contained therein. (Order Granting Respondents' Motion for Leave to Substitute a Replacement Expert Witness, 4 ("The substitute expert witness' trial testimony shall be limited to the opinions, bases or reasons therefor, and the data or other

information considered or relied upon by Dr. Willig, as set forth in Dr. Willig's expert witness report."); [redacted] Given the unreliable nature of Dr. Katz's opinion as well as Respondents' complete disregard of this Court's order, Dr. Katz's opinion should be disregarded.

The proposed finding should also be disregarded because neither Dr. Willig nor Dr. Katz conducted any actual assessment of investments in the liquid biopsy or MCED development industry. In particular, Dr. Katz testified at his trial deposition that he did not conduct an assessment of investments in the biotech industry generally or among MCED test developers individually. (RX6004 (Katz Trial Dep. at 140-141)). Likewise, Dr. Willig did not assess whether investment would have been higher or lower but for the Illumina/Grail transaction and Dr. Willig did not speak to any investors in conducting his analysis. (PX7132 (Willig Dep. at 268, 270)). Dr. Katz also did not communicate with any investors as to their rationale for investing in the liquid biopsy and MCED companies. (RX6004 (Katz Trial Dep. at 141)). Further, Dr. Willig agreed that government enforcement actions can impact investment decisions. (PX7132 (Willig Dep. at 271)).

[redacted]

[redacted]

The proposed finding is also misleading to the extent it implies that the pre-Acquisition investment indicates that MCED tests developers have alternatives to Illumina. [redacted]

[redacted]

Therefore, this Court should disregard the proposed finding.

940. Dr. Scott Morton has attempted to explain away this economic evidence by claiming that, absent the merger, the market would develop into a "bilateral monopoly" where there would be only one or a few winning MCED test developers, who would then have sufficient bargaining leverage to "divid[e] the rent" with Illumina, but this claim is without support. (RX3852 (Scott Morton Dep. at 172 ("So while Illumina would like to expand the market and have more sales and the tests can't [be] delivered without Illumina's product, likewise, tests can't be delivered without the MCED developers' product. So it's a case of a bilateral monopoly. If you think just the MCED developer and Illumina, and that means that they will be dividing the rent. . . . [The] [p]rospect of those rents is what is inducing investment in entry is what I'm trying to say.").)

Response to Finding No. 940

The proposed finding is incomplete and misleading. Respondents mischaracterize Dr. Scott Morton's testimony by adding their own interpretation of the term "bilateral monopoly." Dr. Scott Morton never described "bilateral monopoly" as a market in which "there would be only one or a few winning MCED test developers." That context was added by Respondents and not agreed to by Dr. Scott Morton. Thus, the proposed finding takes Dr. Scott Morton's testimony completely out of context and should be disregarded.

[redacted]

[redacted]

Additionally, Complaint Counsel objects to Respondents' proposed finding to the extent it endorses the biased and inherently unreliable opinion testimony of Dr. Katz. Dr. Katz normally spends approximately three to four hundred hours preparing for an expert report in a matter. (RX6004 (Katz Trial Dep. at 135-136)). Here, Dr. Katz only billed forty to fifty hours. (RX6004 (Katz Trial Dep. at 137)). In total, Dr. Katz allegedly considered over 6,533 pages of material in approximately forth to fifty hours. (RX6004 (Katz Trial Dep. at 137-141)). In effect, this means that he spent approximately less than half a minute per page in reviewing the materials listed on his materials considered list. (PX6105 (Katz Expert Report) at 017-023). Given his cursory review of the record, his opinion in this case is inherently unreliable and should be disregarded.

Moreover, Dr. Katz violated this Court's order to confine his testimony to Dr. Willig's report and the basis for his opinion contained therein. (Order Granting Respondents' Motion for Leave to Substitute a Replacement Expert Witness, 4 ("The substitute expert witness' trial

testimony shall be limited to the opinions, bases or reasons therefor, and the data or other information considered or relied upon by Dr. Willig, as set forth in Dr. Willig's expert witness report."); [redacted] Given the unreliable nature of Dr. Katz's opinion as well as Respondents' complete disregard of this Court's order, Dr. Katz's opinion should be disregarded.

The proposed finding should also be disregarded because Dr. Katz himself did not conduct any actual assessment of investments in the liquid biopsy or MCED development industry. In particular, Dr. Katz testified at his trial deposition that he did not conduct an assessment of investments in the biotech industry generally or among MCED test developers individually. (RX6004 (Katz Trial Dep. at 140-141)). Further, Dr. Katz did not communicate with any investors as to their rationale for investing in the liquid biopsy and MCED companies. (RX6004 (Katz Trial Dep. at 141)).

Further, there are a number of other "economically logical explanation[s] for the sunk investments" that Dr. Katz did not consider. [redacted]

[redacted]

The proposed finding is also incomplete, misleading, and against the weight of substantial evidence to the extent Respondents suggest that [redacted]

[redacted], this Court should disregard the proposed finding.

940.1 Dr. Scott Morton can cite no evidence to support her speculation that the market is likely to develop that way, or that the purported MCED developers she identifies have such expectations and justify their investments on this basis.

Response to Finding No. 940.1

First, the proposed finding should be wholly disregarded because it lacks any citation to the record and is entirely unsupported. Second, the proposed finding is vague because it does not define "that way," "such expectations," or "this basis." The proposed finding is incomplete and misleading. Respondents mischaracterize Dr. Scott Morton's testimony by adding their own interpretation of the term "bilateral monopoly." Dr. Scott Morton never described "bilateral monopoly" as a market in which "there would be only one or a few winning MCED test developers." That context was added by Respondents and not agreed to by Dr. Scott Morton.

Thus, the proposed finding takes Dr. Scott Morton's testimony completely out of context and should be disregarded.

[redacted]

Moreover, the proposed finding is incomplete and misleading to the extent Respondents suggest that Illumina's acquisition of Grail will incentivize investment in the NGS cancer screening market. [redacted] Therefore, this Court should disregard the proposed finding.

940.2 Further, she separately contended that a bilateral monopoly is unlikely, arguing that, in the but-for world without the merger, Illumina would ensure that there are multiple MCED makers in the market to "lower the profits of the MCED makers and deliver more of it to Illumina." (RX3852 (Scott Morton Dep. at 290).)

Response to Finding No. 940.2

The proposed finding is incomplete and misleading. Respondents mischaracterize Dr. Scott Morton's testimony by adding their own interpretation of the term "bilateral monopoly." Dr. Scott Morton never described "bilateral monopoly" as a market in which "there would be only one or a few winning MCED test developers." That context was added by Respondents and not agreed to by Dr. Scott Morton. Here, Respondents invent additional context for another quote that Dr. Scott Morton used in her deposition that bears no relation to Respondents' fabricated definition of "bilateral monopoly." Thus, the proposed finding takes Dr. Scott Morton's testimony completely out of context and should be disregarded.

[redacted]

[redacted]

940.3 [redacted]

Response to Finding No. 940.3

[redacted]

941. The only economically logical explanation for the sunk investments is that test developers—just as Illumina does—anticipate intensifying upstream competition and being able to switch to alternative platforms if Illumina attempted any opportunistic hold up. (Katz Trial Dep. at 42:17–46:14.)

Response to Finding No. 941

Complaint Counsel objects to Respondents' proposed finding to the extent it endorses the biased and inherently unreliable opinion testimony of Dr. Katz. Dr. Katz normally spends

approximately three to four hundred hours preparing for an expert report in a matter. (RX6004 (Katz Trial Dep. at 135-136)). Here, Dr. Katz only billed forty to fifty hours. (RX6004 (Katz Trial Dep. at 137)). In total, Dr. Katz allegedly considered over 6,533 pages of material in approximately forth to fifty hours. (RX6004 (Katz Trial Dep. at 137-141)). In effect, this means that he spent approximately less than half a minute per page in reviewing the materials listed on his materials considered list. (PX6105 (Katz Expert Report) at 017-023). Given his cursory review of the record, his opinion in this case is inherently unreliable and should be disregarded.

Moreover, Dr. Katz violated this Court's order to confine his testimony to Dr. Willig's report and the basis for his opinion contained therein. (Order Granting Respondents' Motion for Leave to Substitute a Replacement Expert Witness, 4 ("The substitute expert witness' trial testimony shall be limited to the opinions, bases or reasons therefor, and the data or other information considered or relied upon by Dr. Willig, as set forth in Dr. Willig's expert witness report."); [redacted] Given the unreliable nature of Dr. Katz's opinion as well as Respondents' complete disregard of this Court's order, Dr. Katz's opinion should be disregarded.

The proposed finding should also be disregarded because Dr. Katz himself did not conduct any actual assessment of investments in the liquid biopsy or MCED development industry. In particular, Dr. Katz testified at his trial deposition that he did not conduct an assessment of investments in the biotech industry generally or among MCED test developers individually. (RX6004 (Katz Trial Dep. at 140-141)). Further, Dr. Katz did not communicate

with any investors as to their rationale for investing in the liquid biopsy and MCED companies. (RX6004 (Katz Trial Dep. at 141)).

Further, there are a number of other "economically logical explanation[s] for the sunk investments" that Dr. Katz did not consider. [redacted]

[redacted]

The proposed finding is also incomplete, misleading, and against the weight of substantial evidence to the extent Respondents suggest that [redacted]

The proposed finding is also misleading to the extent it implies that the pre-Acquisition investment indicates that MCED tests developers have alternatives to Illumina. [redacted]

Therefore, this Court should disregard the proposed finding.

> 941.1 As Dr. Katz explained, "if Complaint Counsel's view of the world and Dr. Scott Morton's view of the world is correct, it would be a risk of really substantial holdup, and these firms just shouldn't be making these investments. But in fact they have made these investments in the past, and . . . those investments are ongoing, and that indicates that in fact they don't believe that they're going to be held up like this. And so . . . their conduct then is inconsistent with Complaint Counsel and Dr. Scott Morton's theory of harm and . . . view of how the economic world operates." (Katz Trial Dep. at 42:17–46:14.)

Response to Finding No. 941.1

Complaint Counsel objects to Respondents' proposed finding to the extent it endorses the biased and inherently unreliable opinion testimony of Dr. Katz. Dr. Katz normally spends approximately three to four hundred hours preparing for an expert report in a matter. (RX6004 (Katz Trial Dep. at 135-136)). Here, Dr. Katz only billed forty to fifty hours. (RX6004 (Katz Trial Dep. at 137)). In total, Dr. Katz allegedly considered over 6,533 pages of material in approximately forty to fifty hours. (RX6004 (Katz Trial Dep. at 137-141)). In effect, this means that he spent approximately less than half a minute per page in reviewing the materials listed on his materials considered list. (PX6105 (Katz Expert Report) at 017-023). Given his cursory review of the record, his opinion in this case is inherently unreliable and should be disregarded.

Moreover, Dr. Katz violated this Court's order to confine his testimony to Dr. Willig's report and the basis for his opinion contained therein. (Order Granting Respondents' Motion for Leave to Substitute a Replacement Expert Witness, 4 ("The substitute expert witness' trial testimony shall be limited to the opinions, bases or reasons therefor, and the data or other information considered or relied upon by Dr. Willig, as set forth in Dr. Willig's expert witness report."); [redacted] Given the unreliable nature of Dr. Katz's opinion as well as Respondents' complete disregard of this Court's order, Dr. Katz's opinion should be disregarded.

The proposed finding should also be disregarded because Dr. Katz himself did not conduct any actual assessment of investments in the liquid biopsy or MCED development industry. In particular, Dr. Katz testified at his trial deposition that he did not conduct an assessment of investments in the biotech industry generally or among MCED test developers individually. (RX6004 (Katz Trial Dep. at 140-141)). Further, Dr. Katz did not communicate with any investors as to their rationale for investing in the liquid biopsy and MCED companies. (RX6004 (Katz Trial Dep. at 141)).

Further, there are a number of other "economically logical explanation[s] for the sunk investments" that Dr. Katz did not consider. [redacted]

[redacted]

[redacted]

The proposed finding is also misleading to the extent it implies that the pre-Acquisition investment indicates that MCED tests developers have alternatives to Illumina. [redacted]

[redacted] Therefore, this Court should disregard the proposed finding.

941.2 Dr. Katz further explained, that inference holds true both for investment activity before Illumina announced its agreement to acquire GRAIL and afterward – it is "really the same economic logic in either case." (RX6004 (Katz Trial Dep. at 46:15–47:3).)

Response to Finding No. 941.2

The proposed finding is vague because it does not define "that inference" or describe what Dr. Katz means by "really the same economic logic in either case." It is misleading to the extent that Dr. Katz suggests that an MCED test developer would consider pursuing an MCED test in the same way if Illumina owns Grail as if it does not. [redacted]

Additionally, Complaint Counsel objects to Respondents' proposed finding to the extent it endorses the biased and inherently unreliable opinion testimony of Dr. Katz. Dr. Katz normally spends approximately three to four hundred hours preparing for an expert report in a matter. (RX6004 (Katz Trial Dep. at 135-136)). Here, Dr. Katz only billed forty to fifty hours. (RX6004 (Katz Trial Dep. at 137)). In total, Dr. Katz allegedly considered over 6,533 pages of material in approximately forth to fifty hours. (RX6004 (Katz Trial Dep. at 137-141)). In effect, this means that he spent approximately less than half a minute per page in reviewing the materials listed on his materials considered list. (PX6105 (Katz Expert Report) at 017-023). Given his cursory review of the record, his opinion in this case is inherently unreliable and should be disregarded.

Moreover, Dr. Katz violated this Court's order to confine his testimony to Dr. Willig's report and the basis for his opinion contained therein. (Order Granting Respondents' Motion for

Leave to Substitute a Replacement Expert Witness, 4 ("The substitute expert witness' trial testimony shall be limited to the opinions, bases or reasons therefor, and the data or other information considered or relied upon by Dr. Willig, as set forth in Dr. Willig's expert witness report."); [redacted] Given the unreliable nature of Dr. Katz's opinion as well as Respondents' complete disregard of this Court's order, Dr. Katz's opinion should be disregarded.

The proposed finding should also be disregarded because Dr. Katz himself did not conduct any actual assessment of investments in the liquid biopsy or MCED development industry. In particular, Dr. Katz testified at his trial deposition that he did not conduct an assessment of investments in the biotech industry generally or among MCED test developers individually. (RX6004 (Katz Trial Dep. at 140-141)). Further, Dr. Katz did not communicate with any investors as to their rationale for investing in the liquid biopsy and MCED companies. (RX6004 (Katz Trial Dep. at 141)).

Further, there are a number of other "economically logical explanation[s] for the sunk investments" that Dr. Katz did not consider. [redacted]

[redacted]

[redacted]

The proposed finding is also misleading to the extent it implies that the pre-Acquisition investment indicates that MCED tests developers have alternatives to Illumina. [redacted] Therefore, this Court should disregard the proposed finding.

942. Professor Scott Morton also claims that investment could have been even greater but for the Transaction, but she offers no evidence of that but-for world, and as Dr. Katz

explained, in all events, "the point still remains that there's substantial investment . . . both before and after the merger, and the existence of that investment is inconsistent with . . . these companies fearing the holdup that would be implied by Dr. Scott Morton's view of the world." (Katz Trial Dep. at 47:21–48:14.)

Response to Finding No. 942

The proposed finding is vague, incomplete, and misleading. It is vague because it does not define "substantial investment" or explain what level of investment Dr. Katz believes would be needed to show that MCED test developers fear being held up by Illumina.

Additionally, Complaint Counsel objects to Respondents' proposed finding to the extent it endorses the biased and inherently unreliable opinion testimony of Dr. Katz. Dr. Katz normally spends approximately three to four hundred hours preparing for an expert report in a matter. (RX6004 (Katz Trial Dep. at 135-136)). Here, Dr. Katz only billed forty to fifty hours. (RX6004 (Katz Trial Dep. at 137)). In total, Dr. Katz allegedly considered over 6,533 pages of material in approximately forth to fifty hours. (RX6004 (Katz Trial Dep. at 137-141)). In effect, this means that he spent approximately less than half a minute per page in reviewing the materials listed on his materials considered list. (PX6105 (Katz Expert Report) at 017-023). Given his cursory review of the record, his opinion in this case is inherently unreliable and should be disregarded.

Moreover, Dr. Katz violated this Court's order to confine his testimony to Dr. Willig's report and the basis for his opinion contained therein. (Order Granting Respondents' Motion for Leave to Substitute a Replacement Expert Witness, 4 ("The substitute expert witness' trial testimony shall be limited to the opinions, bases or reasons therefor, and the data or other information considered or relied upon by Dr. Willig, as set forth in Dr. Willig's expert witness report."); [redacted]

[redacted] Given the unreliable nature of Dr. Katz's opinion as well as Respondents' complete disregard of this Court's order, Dr. Katz's opinion should be disregarded.

The proposed finding should also be disregarded because Dr. Katz himself did not conduct any actual assessment of investments in the liquid biopsy or MCED development industry. In particular, Dr. Katz testified at his trial deposition that he did not conduct an assessment of investments in the biotech industry generally or among MCED test developers individually. (RX6004 (Katz Trial Dep. at 140-141)). Further, Dr. Katz did not communicate with any investors as to their rationale for investing in the liquid biopsy and MCED companies. (RX6004 (Katz Trial Dep. at 141)).

Further, there are a number of other "economically logical explanation[s] for the sunk investments" that Dr. Katz did not consider. [redacted]

[redacted]

The proposed finding is also incomplete, misleading, and against the weight of substantial evidence to the extent Respondents suggest that [redacted]

[redacted]

The proposed finding is also misleading to the extent it implies that the pre-Acquisition investment indicates that MCED tests developers have alternatives to Illumina. [redacted]

[redacted] Therefore, this Court should disregard the proposed finding.

4. **The FTC's Theory Is Belied by the Purchase Price Illumina Paid For GRAIL**

943. [redacted]

Response to Finding No. 943

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3.

Here Respondents cite Dr. Willig in contravention of this Court's Order. This Court should disregard this evidence.

Even if the Court considers this opinion versus fact testimony, the proposed finding still is unsupported given the only source is Dr. Willig's improper expert testimony offered in contravention of this Court's order. Dr. Willig submitted an expert report as well as deposition testimony. (*See,* (RX3871 (Willig Expert Report); (PX7132, (Willig Dep.))). [redacted] Accordingly, Respondents asked the Court to allow them to substitute a new expert to "step into Dr. Willig's shoes." (Mot. for Leave to Substitute a Replacement Expert Witness, 2). The Court granted Respondents' narrow request holding that Respondents may *substitute* a new expert for Dr. Willig. (Order Granting Respondents' Motion for Leave to Substitute a Replacement Expert Witness, 4). Respondents took advantage of this Court's order by designating Dr. Michael Katz who submitted his own expert report and later testified by trial deposition. (*See* PX6105 (Katz Expert Report); RX6004 (Katz Trial Dep.).

Respondents continued reliance on Dr. Willig's expert opinions contravenes this Court's order and prejudices Complaint Counsel as Complaint Counsel has not an opportunity to cross examine this witness at trial in violation of Complaint Counsel's rights under this Court's Rules. *See* Rule 3.41 (c) ("Every party . . . shall have the right of due notice, cross-examination, presentation of evidence, objection, motion, argument, and all other rights essential to a fair hearing."). As such, Respondents' Proposed Finding should be disregarded in its entirety as improper expert opinion. Given that Respondents have not provided the support of their

substituted expert – Dr. Katz – or any other fact witnesses, this testimony is unsupported and should be disregarded.

Finally, the proposed finding is irrelevant, misleading, and against the weight of the evidence. [redacted]

Finally, as Complaint Counsel explained, the overwhelming weight of the evidence shows that [redacted]. Therefore, this Court should disregard the proposed finding.

944. [redacted]

Response to Finding No. 944

[redacted]

[redacted]

945. [redacted]

Response to Finding No. 945

[redacted]

[redacted]

5. **No Evidence That Switching Costs Would Prevent Switching in Response to sn Attempted Foreclosure Strategy.**

946. Complaint Counsel's contention that switching an MCED test to any alternative NGS platform would be too costly and time-consuming for a test developer to profitably undertake is without empirical support. (*Supra* PFF ¶¶ 790–796.)

Response to Finding No. 946

[redacted]

[redacted]

[redacted]

947. Complaint Counsel also did no analysis of the size of one-time switching costs relative to the benefits of switching in a hypothetical scenario where Illumina has attempted to foreclose an MCED rival. (RX3871 (Willig Expert Report) ¶¶ 46, 48.)

Response to Finding No. 947

[redacted]

[redacted]

[redacted]

947.1 As Dr. Carlton explained, given the magnitude of the potential downstream market—which, if it reaches its full potential, could be in the tens of billions of dollars—it cannot be assumed that even high switching costs would deter test developers from migrating to a rival platform in response to a hypothetical foreclosure strategy, since whether switching costs impede customer defections depends on not only

the magnitude of switching costs but also the benefits from switching. (RX6000 (Carlton Trial Dep. at 38–39).)

Response to Finding No. 947.1

The proposed finding is incomplete, speculative, misleading, and unsupported by the weight of substantial evidence demonstrating that a viable alternative NGS sequencer to Illumina is purely hypothetical at this point, MCED developers have indicated that switching costs are enormous, and there are significant barriers to commercialization of an alternative NGS platform besides the switching costs. In addition, the proposed finding is inherently speculative as Respondents cite only to the paid testimony of Dr. Carlton that is uncorroborated by any ordinary course documents, analysis, or MCED test developers' testimony [redacted] Given the inherent unreliability of this testimony as well as lack of foundation or explanation for Dr. Carlton's baseless conjecture, this proposed finding of fact should be disregarded.

[redacted]

948. [redacted] (*Supra* PFF ¶ 791.)

Response to Finding No. 948

[redacted]

[redacted]

[redacted]

948.1 [redacted]

Response to Finding No. 948.1

[redacted]

[redacted]

948.2 Yet neither Complaint Counsel nor Dr. Scott Morton offered any empirical assessment of the *incremental* cost of switching from an Illumina platform to a

third-party platform as compared to the switching cost that would be incurred by a test developer that seeks to upgrade to Illumina's next generation system. (RX3871 (Willig Expert Report) ¶¶ 46, 48.)

Response to Finding No. 948.2

[redacted]

[redacted]

[redacted]

949. Numerous fact witnesses, as well as Dr. Cote, the only technical expert to opine on the matter, testified as to the feasibility of switching, and some Illumina customers have done so for their oncology tests. ([redacted]; Febbo (Illumina) Tr. 4325–26; Aravanis (Illumina) Tr. 1865.)

Response to Finding No. 949

[redacted]

[redacted]

[redacted]

[redacted]

I. Illumina's Prior Vertical Integrations Belie Complaint Counsel's Theory

1. NIPT

950. Illumina's most analogous past vertical acquisition—that of Verinata Health, Inc. ("Verinata")—shows that when Illumina vertically integrates, it continues to support downstream rivals, Illumina helps grow the space, and innovation and competition flourish to the benefit of patients. (RX3864 (Carlton Expert Report) ¶ 162.)

Response to Finding No. 950

[redacted]

[redacted]

951. In February 2013, Illumina acquired Verinata which had developed an NIPT test for fetal chromosomal abnormalities using a blood sample. (RX3337 (Illumina).)

Response to Finding No. 951

Complaint Counsel has no specific response to this proposed finding.

952. At the time it was acquired, Verinata used Illumina sequencers to develop and perform its test, so the acquisition was vertical, just as Illumina's acquisition of GRAIL is vertical. ([redacted] RX3864 (Carlton Expert Report) ¶ 164.)

Response to Finding No. 952

Complaint Counsel has no specific response to this finding.

953. Verinata was one of four companies offering an NIPT test in the U.S.: Sequenom was first to market in 2011, followed by Verinata, Ariosa, and Natera. (PX7089 (Naclerio (Illumina) Dep. at 42); RX3864 (Carlton Expert Report) ¶ 164.)

Response to Finding No. 953

[redacted]

954. As in this case, Illumina was the upstream supplier of sequencing inputs to each of these companies. (RX3864 (Carlton Expert Report) ¶ 164.)

Response to Finding No. 954

[redacted]

955. Illumina was the upstream supplier of sequencing inputs to each of these companies, and, under Dr. Scott Morton's theory in the present case, would have had incentives to raise the costs of rivals to Verinata in order to restrict NIPT competition downstream and divert sales to Verifi. However, a simple examination of the data contradicts such a theory. In contrast to what would be expected had Illumina attempted to raise rivals' costs following its acquisition of Verinata, NIPT output has expanded, Verinata's share has decreased, and Natera's share has increased. (RX3864 (Carlton Expert Report) ¶ 164.)

Response to Finding No. 955

[redacted]

[redacted]

[redacted]

956. Since the acquisition, the number of NIPT tests conducted by Verinata's rivals on Illumina's platforms in the U.S. has increased in each year for which there is available data. (RX3864 (Carlton Expert Report) ¶ 165.)

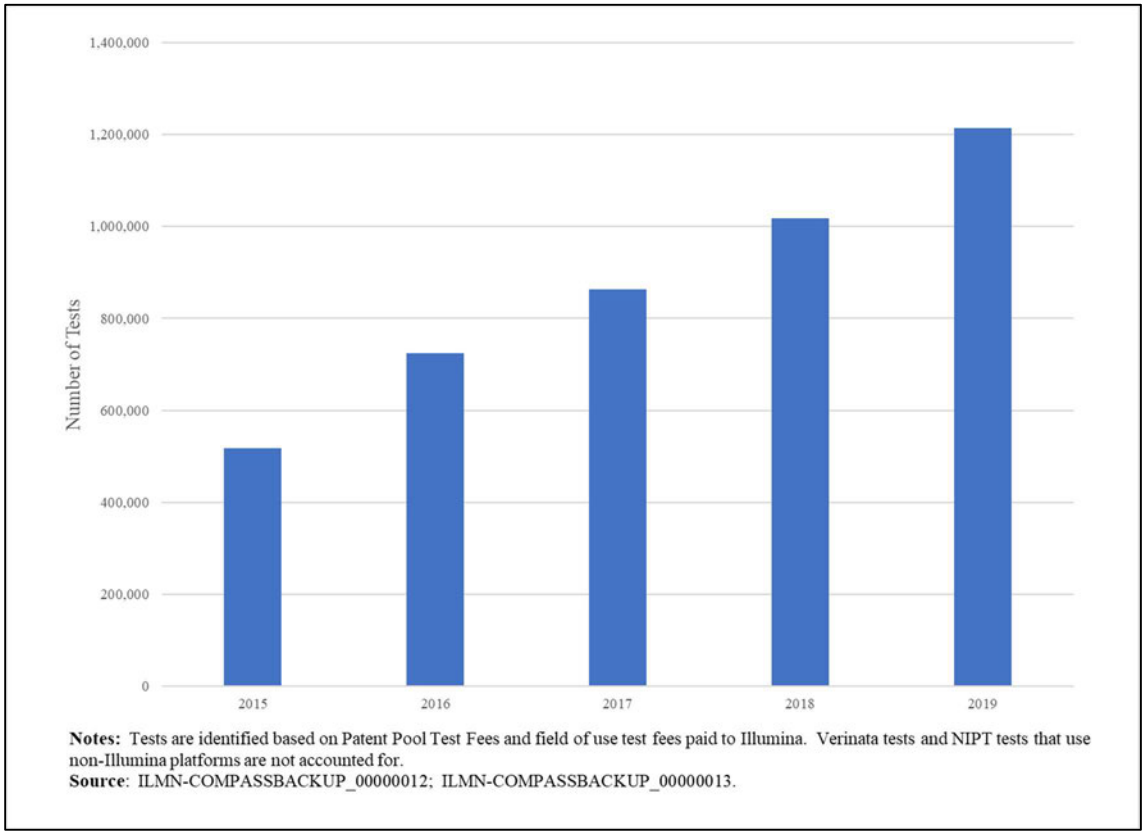
Response to Finding No. 956

[redacted]

[redacted]

956.1 Figure 7 below shows that total NIPT tests conducted by Verinata's rivals on Illumina's sequencing platform have more than doubled between 2015 and 2019.

Figure 7: NIPT Tests Conducted in the U.S. by Verinata Rivals on Illumina's NGS Platform



(RX3864 (Carlton Expert Report), ¶ 165, Figure 3).

Response to Finding No. 956.1

[redacted]

[redacted]

957. In addition to the fact that total output has expanded, Verinata's share of U.S. NIPT sales has decreased. (RX3864 (Carlton Expert Report) ¶ 164.)

Response to Finding No. 957

[redacted]

[redacted]

[redacted]

958. Natera, in contrast, became the market leader after Illumina acquired Verinata, with a consistently high share. (RX3864 (Carlton Expert Report) ¶ 166.)

Response to Finding No. 958

[redacted]

[redacted]

[redacted]

959. Figure 8 below shows the respective shares of U.S. NIPT providers who use the Illumina NGS platform:

(RX3864 (Carlton Expert Report) Figure 4).

Response to Finding No. 959

[redacted]

[redacted]

960. Natera has remained the market leader throughout with a consistently high share, while Verinata's share has fallen more than 50%. (RX3864 (Carlton Expert Report) ¶ 162.)

Response to Finding No. 960

[redacted]

[redacted]

[redacted]

[redacted]

961. [redacted]

Response to Finding No. 961

[redacted]

[redacted]

[redacted]

962. Furthermore, there has been a steady stream of new entry and substantial investment into NIPT testing in the U.S. since the Verinata acquisition, indicating that downstream competitors to Verinata are not concerned that Illumina will act anticompetitively, and that Illumina has not in fact acted anticompetitively, in the NIPT space. (RX3589 (Illumina); RX3864 (Carlton Expert Report) ¶ 162.)

Response to Finding No. 962

[redacted]

[redacted]

962.1 Figure 9 below shows the NIPT providers in the U.S. that use Illumina's platform and which providers entered or exited each year (other providers, using other sequencing platforms, may exist). (RX3864 (Carlton Expert Report) ¶ 167.)

(RX3864 (Carlton Expert Report) at Figure 5.)

Response to Finding No. 962.1

[redacted]

962.2 Since Illumina acquired Verinata, seven new NIPT providers have launched using the Illumina platform and two have exited (with one customer switching to a non-Illumina platform and one customer being acquired). (RX3864 (Carlton Expert Report) ¶ 167.)

Response to Finding No. 962.2

[redacted]

[redacted]

962.3 Overall, the number of NIPT providers on Illumina's platform has more than doubled. Such entry (and the significant investment required to pull it off) is

inconsistent with the claim that Illumina has disadvantaged downstream rivals, or that the fear that it would do so has impeded innovation in the NIPT space. (RX3864 (Carlton Expert Report) ¶ 167.)

Response to Finding No. 962.3

[redacted]

[redacted]

963. A number of fact witnesses confirmed what the economic evidence alone starkly demonstrates: that Illumina's entry into NIPT via a vertical transaction was decidedly procompetitive:

Response to Finding No. 963

Complaint Counsel objects to the proposed finding because it is unsupported, as it does not cite to any evidence of record. This Court should disregard the proposed finding.

> 963.1 Dr. Aravanis testified that since the Verinata acquisition, "the cost of noninvasive prenatal testing has decreased by over 90 percent"; "[t]he number of tests performed has gone up by a factor of a hundred"; "[t]he number of companies offering noninvasive prenatal tests has . . . increased significantly"; and "[t]he coverage of patients for noninvasive prenatal testing has increased by at least 100 million women." (Aravanis (Illumina) Tr. 1933–34.)

Response to Finding No. 963.1

Complaint Counsel objects to the proposed finding because it is misleading, relies on self-serving testimony, and is contrary to the weight of the evidence.

The proposed finding is misleading because the decrease in the cost of NIPT is unrelated to Illumina's acquisition of NIPT. To the contrary, Illumina acquired Verinata so that it could impose a "price floor" that would put a stop to "irrational pricing" by low-cost NIPT providers and prevent further erosion of Illumina's profits. (CCFF ¶ 4115); (PX2076 at 003 (Illumina, Strategic Approach to Shaping the NIPT Market, Mar. 13, 2013)); (PX7060 (Naclerio (Illumina)

IHT at 65)). The proposed finding is likewise misleading because use and payer adoption of NIPT was increasing prior to Illumina's acquisition of Verinata. For example, Illumina's deal model for the acquisition of Verinata assumed that the cost of sequencing for NIPT would decrease by 20% per year. (PX2428 at 019, 024 (Project Positano, Illumina, Dec. 27, 2012)). Likewise, Illumina's vertical integration did not increase payer adoption. [redacted]

The proposed finding relies solely upon the self-serving testimony of Illumina Chief Technology Officer Alex Aravanis to claim that Illumina's acquisition of Verinata was beneficial for NIPT. [redacted] In light of the overwhelming weight of the evidence, which directly contradicts this proposed finding, which is based solely on the self-serving testimony of Illumina's CTO Alex Aravanis, should be disregarded.

963.2 Mr. deSouza testified that in NIPT, Illumina makes "eight times as much revenue selling sequencers and consumables to companies that compete with our test than we do from our own test", which is one of multiple factors driving Illumina's incentives to support all NIPT customers, including its downstream rivals, as the economic evidence demonstrates Illumina has done. (deSouza (Illumina) Tr. 2393–94, 2378–79.)

Response to Finding No. 963.2

Complaint Counsel objects to the proposed finding because it is misleading, relies on self-serving testimony, and is contrary to the weight of the evidence.

[redacted] Moreover, it is grossly misleading to claim that Illumina "supports" all NIPT customers. After acquiring Verinata, Illumina engaged in a scorched earth campaign against its lowest-priced NIPT customers, adopting a strategy to "[c]reate a cost structure for Natera that they can't sustain or introduces a reasonable price floor" and "[l]ock in Ariosa to license terms in order to ensure [a m]arket price floor." (PX2076 at 003 (Illumina, Strategic approach to shaping the NIPT market, Mar. 13, 2013)). As a result of Illumina's conduct, [redacted]; PX2274 at 006 (Strategic Approach to Increasing Value in NIPT Testing, Illumina, Mar. 20, 2013)). In light of the overwhelming weight of the evidence, which directly contradicts this proposed finding, which is based solely on the self-serving testimony of Illumina's CEO Francis deSouza, should be disregarded.

963.3 Mr. deSouza further noted that investment in NIPT increased substantially after Illumina entered that market through the Verinata acquisition. (deSouza (Illumina) Tr. 2392–93.)

Response to Finding No. 963.3

Complaint Counsel objects to the proposed finding because it is misleading, relies on self-serving testimony, and is contrary to the weight of the evidence.

The proposed finding is misleading because it suggests that Illumina's acquisition of Verinata caused the increase in investment in NIPT. This is contradicted by contemporaneous Illumina documents, which projected a massive increase in NIPT testing and payer adoption absent the acquisition of Verinata. (PX2428 at 004 (Project Positano, Illumina, Dec. 27, 2012); *see also* (PX2760 at 005 (Inside Sales Training NIPT, Illumina, Mar. 23, 2016 (showing a timeline of payer adoption with an increase of over 100 million covered lives between 2011 and the acquisition of Verinata in 2013)). Moreover, the relevant inquiry is to compare the level of investment today with what the level of investment *would have been* absent the Verinata acquisition. (Complaint Counsel's Post-Trial Reply Brief § III.F.1.c). Finally, it is improbable that Illumina's acquisition of Verinata drove increased investment in NIPT because Illumina adopted a strategy of limiting participation in NIPT to "few players at economics close to Verinata." (PX2438 at 001, 004 (E-mail from N. Naclerio, Illumina, to N. Donoghoe, McKinsey, Mar. 11, 2013); *see also* (PX2076 at 003 (Illumina, Strategic approach to shaping the NIPT market, Mar. 13, 2013); [redacted]). [redacted] Illumina filed no fewer than four IP lawsuits against its customers that also compete with its NIPT test, and [redacted]; *see also Illumina, Inc. v. Ariosa Diagnostics, Inc.*, No. 3:18-cv-02847 (N.D. Cal. filed May 15, 2018*); Illumina, Inc. v. Natera, Inc.*, No. 3:18-cv-01662 (N.D. Cal. filed Mar. 16,

2018); *Illumina, Inc. v. Ariosa Diagnostics, Inc.*, No. 3:15-cv-02216 (N.D. Cal. filed May 18, 2015); *Illumina, Inc. v. Ariosa Diagnostics, Inc.*, No. 3:14-cv-01921 (N.D. Cal. filed Apr. 25, 2014). In light of the overwhelming weight of the evidence, which directly contradicts this proposed finding, which is based solely on the self-serving testimony of Illumina's CEO Francis deSouza, should be disregarded.

963.4 Invitae, an Illumina NIPT (and oncology) customer, has attested through a sworn declaration from its CEO that Illumina has been a "partner[]" and a "leader[]" in achieving payor coverage for NIPT tests for a broader set of patients, which has benefitted all market participants in that space. (RX1100 (George (Invitae) Decl.¶ 10).)

Response to Finding No. 963.4

Complaint Counsel objects to the proposed finding as incomplete and misleading.

[redacted] Illumina filed no fewer than four IP lawsuits against its customers that also compete with its NIPT test, and [redacted]; *see also Illumina, Inc. v. Ariosa Diagnostics, Inc.*, No. 3:18-cv-02847 (N.D. Cal. filed May 15, 2018*); Illumina, Inc. v. Natera, Inc.*, No. 3:18-cv-01662 (N.D. Cal. filed Mar. 16, 2018);

Illumina, Inc. v. Ariosa Diagnostics, Inc., No. 3:15-cv-02216 (N.D. Cal. filed May 18, 2015); *Illumina, Inc. v. Ariosa Diagnostics, Inc.*, No. 3:14-cv-01921 (N.D. Cal. filed Apr. 25, 2014).

This proposed finding is misleading because Illumina's vertical integration did not cause an increase in payer adoption. [redacted]

Likewise, Illumina's own documents show that payer adoption was already occurring at a rapid rate at the time that Illumina acquired Verinata. (PX2760 at 005 (Inside Sales Training NIPT, Illumina, Mar. 23, 2016 (showing a timeline of payer adoption with an increase of over 100 million covered lives between 2011 and the acquisition of Verinata in 2013)). Likewise, Illumina's presentation to its board of directors about the Verinata acquisition shows that rapid payer adoption was already underway and expected to intensify independently of the acquisition. (PX2428 at 004 (Project Positano, Illumina, Dec. 27, 2012).

2. **Therapy Selection**

964. Illumina has also vertically integrated into therapy selection through organic development of its therapy selection test, TSO500. (Leite (Illumina/InterVenn) Tr. 2075–76; Aravanis (Illumina) Tr. 1952.)

Response to Finding No. 964

The proposed finding is vague because it does not define "organic development." Therefore, this Court should disregard the proposed finding.

964.1 [redacted] As a result, therapy selection test developers compete with each other to convince pharmaceutical companies—who market the therapies—to partner with them for a particular therapy. (Goswami (Illumina) Tr. 3184.)

Response to Finding No. 964.1

[redacted]

965. Although Complaint Counsel claims Illumina's vertical integration into therapy selection resulted in Illumina raising rivals' costs and harming competition, the evidence is to the contrary. (PFF ¶¶ 966–973.)

Response to Finding No. 965

The proposed finding is unsupported because no evidence is cited for this "fact."

Therefore, this Court should disregard the proposed finding.

966. Today, Illumina has collaboration agreements in place with Roche, PGDx and numerous other test developers in therapy selection pursuant to which these formidable competitors to Illumina are developing in-vitro diagnostic ("IVD") tests that will compete with Illumina's own TSO500 therapy selection test. (Goswami (Illumina) Tr. 3202–03.)

Response to Finding No. 966

The proposed finding is vague, misleading, and against the weight of the evidence, and the Court should therefore disregard Respondents' proposed finding. The proposed finding is vague, because Respondents fail to define the terms "numerous" and "formidable."

The proposed finding is misleading and against the weight of the evidence. The proposed finding is generally misleading, insofar as it implies that, after previous vertical acquisitions involving therapy selection tests, Illumina fairly engaged with its downstream competitors. [redacted]

PUBLIC

[redacted]

[redacted]); [redacted]

[redacted]

[redacted]

Rather than referencing evidence or testimony produced by Roche or PGDx, Respondents cite only to the unfounded, self-serving testimony of a single Illumina executive, which is uncorroborated by any ordinary course documents or analysis. Given the inherent unreliability of this testimony as well as lack of foundation or explanation for the executive's base conjecture, this proposed finding of fact should be disregarded.

967. Illumina provides customer support to its therapy selection rivals and there is increasing investment and innovation in this space in recent years. (Goswami (Illumina) Tr. 3202–03.)

Response to Finding No. 967

The proposed finding is misleading, against the weight of the evidence, supported only

by self-serving testimony, and vague, and this Court should therefore disregard Respondents' proposed evidence. The proposed finding is misleading and against the weight of the evidence. The proposed finding is misleading, insofar as it implies that "increasing investment and innovation" in the market for therapy selection tests has anything to do with Illumina. [redacted]

Moreover, rather than referencing documents from Illumina's downstream competitors in the therapy selection test market, Respondents cite only to the unfounded, self-serving testimony of a single Illumina executive, which is uncorroborated by any ordinary course documents or analysis. Given the inherent unreliability of this testimony as well as lack of foundation or explanation for the executive's base conjecture, this proposed finding of fact should be disregarded.

The proposed finding is vague. Respondents fail to define or quantify the terms "increasing investment and innovation" and "recent years."

> 967.1 As Dr. Joydeep Goswami, who oversees Illumina's IVD agreements, testified, "test developers are investing in developing IVD kits under the terms of [Illumina's] IVD agreements", and far from diminishing innovation in kitted oncology tests, Illumina's IVD program "spurs innovation" because test developers can "just tap

into a network of instruments that is available globally that can run the assay that they're providing, so it's a huge saving of investment on their side and time on their side and resources on their side." (Goswami (Illumina) Tr. 3217–18.)

Response to Finding No. 967.1

The proposed finding is misleading, against the weight of the evidence, supported only by self-serving testimony, improper, and vague, and this Court should disregard Respondents' proposed evidence. The proposed finding is misleading and against the weight of the evidence, which clearly shows that Illumina has made every effort to use its control over IVD rights to impair its customers' ability to innovate. [redacted]

[redacted]

Moreover, rather than referencing documents from Illumina's downstream competitors in the therapy selection test market, Respondents cite only to the unfounded, self-serving testimony of a single Illumina executive, which is uncorroborated by any ordinary course documents or analysis. Given the inherent unreliability of this testimony as well as lack of foundation or explanation for the executive's base conjecture, this proposed finding of fact should be disregarded.

Further, the proposed finding is improper and vague. Respondents cite to one of their own executives to about the investment strategies of downstream competitors, several of whom provided evidence in this litigation. It's unclear why—and indeed unlikely that—Mr. Goswami has foundation to discuss the investment strategies or what is a "huge saving of investment . . . and time . . . and resources" of Illumina's downstream competitors simply because he "oversees Illumina's IVD agreements." Therefore, this Court should disregard the proposed finding.

968. From a strategic perspective, Illumina views more test developers using its IVD platform (which it refers to as "IVD partners") as a positive regardless of whether those partners compete with Illumina's TSO500 test. (Goswami (Illumina) Tr. 3201–02, 3217–18.)

Response to Finding No. 968

The proposed finding is vague, misleading, and against the weight of the evidence, and the Court should therefore disregard Respondents' proposed finding. The proposed finding is vague because Respondents fail to define the terms "strategic perspective," "test developers," and "a positive."

[redacted]

[redacted]

[redacted]

Rather than referencing evidence or testimony produced by "test developers using its IVD platform," Respondents cite only to the unfounded, self-serving testimony of a single Illumina executive, which is uncorroborated by any ordinary course documents or analysis. Given the inherent unreliability of this testimony as well as lack of foundation or explanation for the executive's base conjecture, this proposed finding of fact should be disregarded.

> 968.1 As Mr. deSouza testified, "[e]ven in markets where we have our own test, so noninvasive prenatal testing, for example, or cancer therapy selection, . . . or genetic disease diagnosis – even in those markets, we make significantly more money by selling sequencers and consumables to companies that compete with our test than we do from our own test." (deSouza (Illumina) Tr. 2378–79).

Response to Finding No. 968.1

The proposed finding is misleading for two reasons. First, the proposed finding is misleading insofar as it implies that, as a result of the Transaction, Illumina will not be incentivized to disadvantage Grail's competitors because in Illumina's other vertically integrated markets, "[Illumina] make[s] significantly more money by selling sequencers and consumables . . . than [Illumina] do[es] from [its] own test." This may simply indicate that Illumina is bad at selling its own tests, or that Illumina earns smaller margins on their other vertically integrated tests than they do on sequencers and consumables, or, perhaps, that Illumina is charging downstream competitors more for sequencers and consumables. Moreover, it is unclear how Mr. deSouza's claims regarding Illumina's other vertically integrated markets have any bearing on Illumina's behavior or incentives in the MCED test market. In any event, insofar as Respondents imply that Illumina will not disadvantage Grail's downstream rivals, such an implication is not supported by the cited testimony, nor is it supported by the weight of the evidence, which demonstrates that, as a result of the transaction, Illumina has a strong incentive to harm Grail's rivals at both the development and commercialization stages. (*See, e.g.*, Complaint Counsel's Post-Trial Brief Sec. II(E)(1)(b)).

Second, the proposed finding is misleading, in that it is unsupported by Illumina's ordinary course documents. [redacted]

[redacted] This proposed finding is therefore misleading and should be disregarded by this Court.

Rather than referencing evidence or testimony produced by "test developers using its IVD platform," Respondents cite to the unfounded, self-serving testimony of an Illumina executive, which is uncorroborated by any ordinary course documents or analysis. Given the inherent unreliability of this testimony as well as lack of foundation or explanation for the executive's base conjecture, this proposed finding of fact should be disregarded.

> 968.2 As Mr. deSouza testified, "[i]n cancer therapy selection, we make 14 times as much money selling sequencers and consumables to companies that compete with our test than we do from our own test", and that dynamic drives Illumina's strategy which "has been consistently to open up a market and then enable lots of players to serve that market, each with their own different approach, because we believe that maximizes the opportunity in the market." (deSouza (Illumina) Tr. 2379–80).

Response to Finding No. 968.2

The proposed finding is misleading for two reasons. First, the proposed finding is misleading insofar as it implies that, as a result of the Transaction, Illumina will not be incentivized to disadvantage Grail's competitors because in cancer therapy selection, "[Illumina]

make[s] 14 times as much money selling sequencers and consumables to companies that compete with [Illumina's] test than we do from [Illumina's] own test." This may simply indicate that Illumina is bad at selling its own tests, or that Illumina earns smaller margins on their therapy selections tests than they do on sequencers and consumables, or, perhaps, that Illumina is charging downstream competitors more for sequencers and consumables. Moreover, it is unclear how Mr. deSouza's claims regarding Illumina's therapy selection tests have any bearing on Illumina's behavior or incentives in the MCED test market. In any event, insofar as Respondents imply that Illumina will not disadvantage Grail's downstream rivals, such an implication is not supported by the cited testimony, nor is it supported by the weight of the evidence, which demonstrates that, as a result of the transaction, Illumina has a strong incentive to harm Grail's rivals at both the development and commercialization stages. (*See, e.g.*, Complaint Counsel's Post-Trial Brief Sec. II(E)(1)(b)).

Second, the proposed finding is misleading, in that it is unsupported by Illumina's ordinary course documents. [redacted]

[redacted]

This proposed finding is therefore misleading and should be disregarded by this Court.

Rather than referencing evidence or testimony produced by "test developers using its IVD platform," Respondents cite to the unfounded, self-serving testimony of an Illumina executive, which is uncorroborated by any ordinary course documents or analysis. Given the inherent unreliability of this testimony as well as lack of foundation or explanation for the executive's base conjecture, this proposed finding of fact should be disregarded.

969. [redacted]

Response to Finding No. 969

[redacted]

[redacted]

969.1 [redacted]

Response to Finding No. 969.1

Complaint Counsel has no specific response to this proposed finding.

969.2 [redacted]

Response to Finding No. 969.2

Complaint Counsel has no specific response to this proposed finding.

969.3 However, Illumina has in fact signed IVD agreements in therapy selection—including with TMB rights—with anyone that has pursued such rights, and test developers are investing in developing and seeking regulatory approvals for tests under those agreements. (Leite (Illumina/InterVenn) Tr. 2141–3219; Goswami (Illumina) Tr. 3218.)

Response to Finding No. 969.3

The proposed finding is misleading, and against the weight of the evidence, and the Court should therefore disregard Respondents' proposed finding. The proposed finding is misleading and against the weight of the evidence, which demonstrates that Illumina disadvantaged downstream companies because Illumina viewed those companies as rivals. That Illumina has, at some point down the road, "signed IVD agreements . . . with anyone" is besides the point.

[redacted]

970. Complaint Counsel places particular weight on Illumina's interactions with PGDx; however, the evidence refutes Complaint Counsel's claims concerning these interactions:

Response to Finding No. 970

The proposed finding is unsupported because no evidence is cited for this "fact."

971.6 [redacted]

Response to Finding No. 971.6

[redacted]

[redacted]

972. Dr. Scott Morton concluded that the events in the therapy selection space show that Illumina has engaged in foreclosure where it is vertically integrated, yet she does no actual analysis of the therapy selection space and the competitive impact of Illumina's vertical integration into therapy selection. RX6000 (Carlton Trial Dep. at 201).)

Response to Finding No. 972

Respondents confusingly cite to their own experts' trial deposition to support a factual proposition regarding the conclusions of Complaint Counsel's expert. [redacted] Moreover, Respondents mischaracterize their own expert's testimony. Dr. Carlton testified that he has not "seen . . . Dr. Scott Morton analyze" what Dr. Carlton considers to be the relevant question. RX6000 (Carlton Trial Dep. at 200-201). It is not true that Dr. Carlton testified that Dr. Scott Morton "does no actual analysis," as Respondents propose in this finding.

The proposed finding is vague because Respondents fail to define the terms "the events," "actual analysis," and "competitive impact." **Therefo**re, this Court should disregard the proposed finding.

> 972.1 As Dr. Carlton explained, if one were to do an actual economic analysis of the impact of Illumina's vertical integration into therapy selection, "the relevant question" would have to be "what's the but-for world", meaning, "was there a benefit from Illumina being vertically integrated into therapy selection and selling to Roche compared to not having Illumina in therapy selection". (RX6000 (Carlton Trial Dep. at 201).)

Response to Finding No. 972.1

The proposed finding is vague. Respondents' fail to define the terms "actual economic analysis," "relevant," and "benefit."

The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding cites only to Dr. Carlton's trial deposition testimony, in contravention of this Court's Order. (*See* Order on Post-Trial Findings at 3). Respondents improperly rely on Dr. Carlton's expert opinions to support this proposed finding, in contravention of this Court's Order, and otherwise have never provided any evidence to support this proposed finding. Therefore this Court should disregard Respondents' proposed finding.

> 972.2 Yet that is not what Dr. Scott Morton did by a long shot—"she pays no attention to the benefit of vertical integration of Illumina into therapy selection." (RX6000 (Carlton Trial Dep. at 201).)

Response to Finding No. 972.2

The proposed finding is vague. Respondents fail to define the terms "that" or "long shot." The proposed finding is improper because this Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (Order on Post-Trial Findings at 3). Here, Respondents' proposed finding cites only to Dr. Carlton's trial deposition testimony, in contravention of this Court's Order. (*See* Order on Post-Trial Findings at 3). Respondents improperly rely on Dr. Carlton's expert opinions to support this proposed finding, in contravention of this Court's Order, and otherwise have never provided any evidence to support this proposed finding. Therefore this Court should disregard Respondents' proposed finding.

[redacted]

973.2 [redacted]

Response to Finding No. 973.2

[redacted]

3. **Population Genomics and Helix**

974. Several of the exhibits offered by Complaint Counsel relate to Illumina's spinout of Helix, a population genomics company that competes with providers such as Ancestry.com. (*See, e.g.,* PX7077 (Chahine (Helio) Dep.); [redacted]; PX 2420–2421 (Illumina); [redacted]

Response to Finding No. 974

[redacted]

975. Yet, Illumina's conduct in connection with the formation and spinout of Helix was recognized, even by Helix's competitors, as "fantastic". (PX7077 (Chahine (Helio) Dep. at 57) ("Illumina was -- you know, was and continues to be a fantastic partner to -- to Ancestry.").)

Response to Finding No. 975

The proposed finding is misleading. As Respondents include within their citation, Dr. Chahine's quoted testimony concerned Ancestry.com. He was, in no way commenting on "the

formation and spinout of Helix" by Illumina. This proposed finding is just flatly incorrect and should be disregarded by this Court.

J. GRAIL Formation and Spinout

979. Any special pricing and other benefits Illumina may have provided to GRAIL in its original supply agreement when GRAIL was formed and controlled by Illumina are irrelevant to evaluating the effects of the Transaction on competition.

Response to Finding No. 979

The proposed finding is unsupported because no evidence is cited for this "fact." Therefore, this Court should disregard the proposed finding.

980. At the time of GRAIL's formation, the objective of creating a cancer screening test was a moonshot concept, and Illumina believed that without deep discounting, it would be impossible for GRAIL to develop a cancer screening test:

Response to Finding No. 980

The proposed finding is uncited, improper, vague, and should be rejected by this Court. The proposed finding is unsupported because no evidence is cited for the factual proposition. This Court has ordered that "[a]ll proposed findings of fact shall be supported by specific references to the evidentiary record." (Order on Post-Trial Findings at 2). Here, Respondents' fail to provide any specific reference in support of their proposed findings, in direct contravention of this Court's Order. The proposed finding is also vague, as Respondents fail to

define the terms "moonshot concept" or "deep discounting." Therefore, this Court should disregard the proposed finding.

> 980.1 As Dr. Aravanis, who helped form GRAIL, testified, the industry reaction to the formation of GRAIL was "very, very skeptical" because the conventional wisdom was that, while GRAIL's mission was "noble", "it will be very hard, may not work at a scientific level and, even if it did, will take a very long time and be very challenging from a cost and clinical development" perspective. (Aravanis (Illumina) Tr. 1873–74.)

Response to Finding No. 980.1

The proposed finding is unreliable and vague, and this Court should therefore disregard Respondents' proposed evidence. The proposed finding is unreliable because Dr. Aravanis does not have foundation to speak to the "industry reaction" to Illumina's formation of Grail. Moreover, the proposed finding is vague, in that Respondents fail to define the terms "industry reaction," "very, very skeptical," "conventional wisdom," "noble," "very hard," "may not work," "very long time," and "very challenging."

> 980.1.1 As Dr. Nick Naclerio, Illumina's Senior Vice President of Corporate and Venture Development at the time of GRAIL's formation, testified, "I think at the time most of the other companies in the field thought—and what they told their investors was Illumina is kind of crazy to go after this [asymptomatic] pan cancer screening, that we're going after more reasonable commercial applications, like screening high-risk people or minimal residual disease or other things like that, and, you know, Illumina is kind of going after this crazy thing. Well, it's kind of good for the field, but I think most people thought it was a science project. (PX7089 (Naclerio (Illumina) Dep. at 276).)

Response to Finding No. 980.1.1

The proposed finding is unreliable, vague, and should be disregarded by this Court. The proposed finding is unreliable because Dr. Naclerio does not have foundation to speak to what "most of the other companies in the field thought—and what they told their investors." In particular, Dr. Naclerio has no basis to opine regarding the "thoughts" of other companies, and Respondents should not be permitted to pass his own opinions on other companies' "thoughts" as facts. Moreover, the proposed finding is vague. Respondents fail to define the terms "most of

the other companies," "kind of crazy," "we're," "kind of good for the field," "a science project." This Court should disregard the proposed finding.

> 980.2 As Illumina's contemporaneous internal documents noted, at the time, Illumina believed that "no customer has the ability to implement a pan-cancer screening test responsibly and economically anytime in the next 5 years"; therefore, to accelerate the growth of the segment, Illumina "felt an imperative to organize an entity" focused on that moon-shot mission. (RX1088 (Illumina) at 7; (Flatley (Illumina) Dep. at 111–12).)

Response to Finding No. 980.2

The proposed finding is misleading, unsupported, and vague, and this Court should disregard Respondents' proposed evidence. The proposed finding is misleading, insofar as it implies that Illumina created Grail to "accelerate growth of the segment." Such an inference is against the weight of the evidence. (*See generally*, CCFF I.A.2-3). Specifically, by forming Grail, Illumina assessed that it could "capitalize on [the] screening market years earlier AND own a substantial portion of the value created." (CCFF ¶ 34). After spinning off Grail, Illumina provided Grail with advantages relative to the "segment." While Illumina controlled Grail, Illumina provided Grail with "forward pricing." (CCFF ¶ 30). "Forward pricing" meant that Illumina charged Grail what Illumina expected its prices to be a number of years in the future. (CCFF ¶ 30). The impact of providing forward pricing to Grail was that Illumina gave Grail discounts on reagents. (CCFF ¶ 30). In an internal 2015 document, Illumina identified preferential, low-cost access to Illumina sequencing technology as a competitive advantage for Grail: Grail "is uniquely positioned to pioneer this field . . . at depths that are cost prohibitive for others." (CCFF ¶ 36). Illumina initially offered a 75 percent discount on Illumina products for use in Grail's "Foundational Study and commercial screening." (CCFF ¶ 37).

The proposed finding is unsupported because the finding claims that "internal documents" note Illumina's belief. Yet Respondents cite to only one internal document in support of this claim. The proposed finding is vague. Respondents fail to define the terms

"responsibly," "economically," "growth of the segment," and "moon-shot mission."

Further, the proposed finding is in contravention of this Court's Order, which requires that "when citing to exhibits, the parties shall identify the document by the PX or RX number[.]" (Order on Post-Trial Findings at 3). Here, Respondents fail to provide a PX or RX number for the second source of their string citation. Therefore, this Court should disregard the proposed finding.

> 980.3 In other words, there was no one else pursuing the goal that Illumina set GRAIL on a path to pursue, and any special pricing at that time was not designed to put rivals at a disadvantage—there were no rivals, and the goal was in fact to *accelerate* the development of the cancer screening space by years, which would benefit others who might seek to invest in the space. (Aravanis (Illumina) Tr. 1873–74; RX1088 (Illumina) at 7.))

Response to Finding No. 980.3

The proposed finding is misleading, unsupported, and vague, and this Court should disregard Respondents' proposed evidence. The proposed finding is misleading, insofar as it implies that Illumina created Grail to "accelerate growth of the segment." Such an inference is against the weight of the evidence. (*See* generally, CCFF I.A.2-3). Specifically, by forming Grail, Illumina assessed that it could "capitalize on [the] screening market years earlier AND own a substantial portion of the value created." (CCFF ¶ 34). After spinning off Grail, Illumina provided Grail with advantages relative to the "segment." While Illumina controlled Grail, Illumina provided Grail with "forward pricing." (CCFF ¶ 30). "Forward pricing" meant that Illumina charged Grail what Illumina expected its prices to be a number of years in the future. (CCFF ¶ 30). The impact of providing forward pricing to Grail was that Illumina gave Grail discounts on reagents. (CCFF ¶ 30). In an internal 2015 document, Illumina identified preferential, low-cost access to Illumina sequencing technology as a competitive advantage for Grail: Grail "is uniquely positioned to pioneer this field . . . at depths that are cost prohibitive for

others." (CCFF ¶ 36). Illumina initially offered a 75 percent discount on Illumina products for use in Grail's "Foundational Study and commercial screening." (CCFF ¶ 37). Therefore, this Court should disregard the proposed finding.

> 980.4 As Dr. Naclerio put it: "Illumina really went out of its way to create something that we thought no one else was going to do. . . . [I]f you look at the original agreements around what GRAIL can and can't do . . . we designed it specifically so that they wouldn't be competing with any other near-term products of any of the other companies we've talked about. It was really meant to be bringing in something that might someday be possible in the future by years. And I think if you look at the original GRAIL business plan, they talk about how this would save tens of thousands of lives by having this available sooner." (PX7089 (Naclerio (Illumina) Dep. at 275–76).)

Response to Finding No. 980.4

The proposed finding is vague, unreliable, self-serving testimony. It is vague because Respondents do not explain how Illumina "went out of its way" nor do Respondents define what the phrase "something that might someday be possible in the future by years" means. It is unreliable because it relies solely upon the self-serving testimony of Illumina's executive Mr. Naclerio. Further, Respondents asked an improper vague question to elicit this response. As such this statement is unclear, unreliable and should be disregarded and given limited weight.

981. These considerations from the time of GRAIL's formation no longer exist for many reasons, including because (i) the cost of sequencing has come down since 2016 (*supra* PFF ¶ 22); and (ii) Illumina's assumptions about the volume of sequencing required to develop a cancer screening test were significantly higher than what is actually required (Flatley (Illumina) Dep. at 118–20).)

Response to Finding No. 981

The proposed finding is vague. Respondents fail to define the terms "these considerations," "many reasons," "come down," and "significantly higher." Therefore, this Court should disregard the proposed finding.

VII. COMPLAINT COUNSEL ERRS IN DISMISSING THE OPEN OFFER

A. Background on Supply Agreements and Illumina's Commercial Operations Organization

982. Illumina's products and services serve customers in a wide range of markets, enabling the adoption of genomic solutions in research and clinical settings. (PX0061 (Illumina) at 5.)

Response to Finding No. 982

The proposed finding is vague because the terms "genomic solutions" and "research and clinical settings" are ambiguous and undefined. Moreover, the proposed finding is vague as to the meaning of "enabling the adoption of genomics solutions." Therefore, this Court should disregard the proposed finding.

982.1 Illumina's customers include genomic research centers, academic institutions, government laboratories and hospitals. (PX0061 (Illumina) at 5.) They also include pharmaceutical companies, biotechnology companies, commercial molecular diagnostic laboratories and consumer genomics companies. (PX0061 (Illumina) at 5.)

Response to Finding No. 982.1

Complaint Counsel has no specific response to this proposed finding.

983. Illumina's commercial operations organization for the Americas region is responsible for customer-facing activities to drive both revenue and customer success for all of Illumina's current and potential customers in the region. (Berry (Illumina) Tr. 833–34.) The team consists of about 700 people and is led by Nicole Berry, Illumina's Senior Vice President and General Manager of the Americas Commercial Team. (Berry (Illumina) Tr. 833.)

Response to Finding No. 983

[redacted]

[redacted]

983.1 The sales organization is responsible for ongoing customer interactions in the normal course of business, including prospecting and acquiring new customers, managing existing customers and providing post-sale support. (Berry (Illumina) Tr. 834.)

Response to Finding No. 983.1

Complaint Counsel has no specific response to this proposed finding.

983.2 The commercial team is highly focused on driving customer success because a key part of Illumina's value proposition and ability to drive growth is customer satisfaction. (Berry (Illumina) Tr. 835.)

Response to Finding No. 983.2

[redacted]

[redacted]

[redacted]

[redacted]

983.3 Illumina validates customer satisfaction through surveys and other methods for collecting feedback. (Berry (Illumina) Tr. 837–38.)

Response to Finding No. 983.3

The proposed finding relies solely upon the self-serving testimony of Illumina's Senior Vice President and General Manager of Americas, Nicole Berry, and does not include any evidence or support from any of Illumina's customers. Moreover, the proposed finding is misleading to the extent that it implies Illumina prioritizes customer satisfaction over making as much money as possible. First and foremost, Illumina is a public company that cares about maximizing its revenue for its shareholders above all else. [redacted] When acquiring Grail, deSouza told Illumina's investors that the Acquisition will create more value for Illumina's shareholders than simply selling instruments and reagents to Grail. (deSouza (Illumina) Tr. 2220).

Second, the weight of the evidence shows that Illumina's reputation among its customers is already poor. [redacted]

[redacted].

Illumina's customers agree. For example, Ariosa's former CEO, Mr. Song testified that Illumina is "kind of the big bully" and "people are scared of them." (PX7071 (Song (Omniome) IHT at 43-44)). [redacted].

Given Illumina's poor reputation, customers are careful in their dealings with Illumina. As [redacted]. Singlera's Dr. Gao similarly testified that when working with Illumina its "their [Illumina's] way is my way or the highway. If you gave [Illumina] that profit margin, well, [Illumina] – you know, [Illumina] can allow you to survive. If not, you just die." (PX7042 (Gao (Singlera) IHT at 87-88)).

Invitae's Mr. Stahl and Singlera's Mr. Gao both testified that Illumina is the 800-pound gorilla as "Illumina control[s] the supply chain for all the NGS-based early cancer detection technology, not only for Singlera, but for other companies." (Gao (Singlera) Tr. 2951; PX7044

(Stahl (Invitae) IHT at 49-50); *see also* Gao (Singlera) Tr. 2947-48). Illumina "dominate[s]" the industry. (PX7044 (Stahl (Invitae) IHT at 49-50)). Therefore, this Court should disregard the proposed finding.

983.4 Since acquiring GRAIL, Illumina has not changed the way its commercial team (or Illumina as a whole) will interact with customers because Illumina's goal of unlocking the power of the genome can be accomplished only by making it easy for customers to access Illumina's technology. (Berry (Illumina) Tr. 838–39.)

Response to Finding No. 983.4

[redacted]

[redacted]

[redacted]

983.5 After the transaction, Illumina's core commercial sales team will not have any role in selling GRAIL's products. (Berry (Illumina) Tr. 839.)

Response to Finding No. 983.5

The proposed finding relies solely upon the self-serving testimony of Illumina's Senior Vice President and General Manager of the Americas commercial region, Nicole Berry. Moreover, the proposed finding is incomplete as it is against the weight of the evidence, and incorrect based on Ms. Berry's other testimony. Ms. Berry testified that the new account manager in charge of Grail's account ultimately reports to Ms. Berry. (CCFF ¶¶ 4756-57).

[redacted] Therefore, this Court should disregard the proposed finding.

984. Existing Illumina customers that do not have a pricing agreement begin the process of purchasing a sequencing instrument or core consumable by initiating a conversation with their Illumina sales representative. (Berry (Illumina) Tr. 840.)

Response to Finding No. 984

The proposed finding is misleading to the extent it implies that Illumina customers without a pricing agreement always begin the process of purchasing a sequencing instrument or core consumables by conversing with an Illumina sales representative. Ms. Berry's own trial testimony states that if a customer does not "have a pricing agreement, they *would likely* initiate a conversation with their Illumina sales representative…" (Berry (Illumina) Tr. 840) (emphasis added). Therefore, this Court should disregard the proposed finding.

984.1 The representative ensures that the customer purchases the Illumina products best fit for their needs and then provides a price quote. (Berry (Illumina) Tr. 840–41.) The customer then executes a purchase order consistent with the price quote. (Berry (Illumina) Tr. 841.)

Response to Finding No. 984.1

Complaint Counsel has no specific response to this proposed finding.

985. Sometimes, Illumina's customers desire terms and conditions that are sufficiently different from Illumina's standard terms and conditions to warrant negotiating a customer-specific supply agreement. (Berry (Illumina) Tr. 841–42.)

Response to Finding No. 985

[redacted]

[redacted]

985.1 In these circumstances, Illumina is very open to negotiating terms and conditions. (Berry (Illumina) Tr. 842.) These negotiations often culminate in a separate supply agreement that captures all of the terms and conditions for that customer that differ from the standard terms and conditions. (Berry (Illumina) Tr. 842.)

Response to Finding No. 985.1

[redacted]

[redacted]

985.2 Illumina enters all of its supply agreements with the intent to follow them and has never entered a supply agreement planning to not follow it. (Berry (Illumina) Tr. 843.)

Response to Finding No. 985.2

[redacted]

[redacted]

[redacted]

[redacted]

986. Customer testimony supports the view that Illumina abides by the terms of its supply agreements. (*See* Fiedler (FMI) Tr. 4471.) For example, Dr. Fiedler, COO of FMI, testified that since entering into a supply agreement with Illumina in 2013:

Response to Finding No. 986

The proposed finding is vague and confusing. The proposed finding is vague because the phrase "supports the view" is ambiguous and undefined. The proposed finding is confusing because it purports to highlight testimony of Mr. Fiedler but fails to actually quote any testimony.

[redacted]

986.1 Illumina has acted in good faith with respect to its obligations under the supply agreement. (Fiedler (FMI) Tr. 4471.)

Response to Finding No. 986.1

The proposed finding is vague because it does not define "good faith" or specify which supply agreement it is referring to.

[redacted]

986.2 FMI is a satisfied customer. (Fiedler (FMI) Tr. 4471.)

Response to Finding No. 986.2

[redacted]

[redacted]

986.3 Illumina has never monkeyed with supply. (Fiedler (FMI) Tr. 4471.)

Response to Finding No. 986.3

This proposed finding is vague and confusing because the term "monkeyed" is ambiguous and undefined.

[redacted]

[redacted]

The proposed finding is against weight of the evidence to the extent it implies that Illumina has never altered a customer's supply. [redacted]

986.4 Illumina has never interrupted supply because it claimed FMI had infringed on Illumina's intellectual property. (Fiedler (FMI) Tr. 4471.)

Response to Finding No. 986.4

The proposed finding is confusing because it is unclear whether it purports to state that

Illumina has never interrupted supply or has never interrupted supply for this specific reason (but may have for other reasons). The proposed finding is vague because it fails to define "interrupt."

[redacted]

986.5 Illumina has never reneged on a commitment it made to FMI. (Fiedler (FMI) Tr. 4471.)

Response to Finding No. 986.5

This proposed finding is confusing because the testimony states only that Illumina has not reneged on a commitment made to Mr. Fiedler. (Fiedler (FMI) Tr. 4471-72.) The proposed finding is vague because it fails to define "reneged."

[redacted]

[redacted]

986.6 Dr. Fiedler trusts Illumina to abide by its commitments. (Fiedler (FMI) Tr. 4471.)

Response to Finding No. 986.6

Response to Finding No. 989.23

[redacted]

[redacted]

[redacted]

[redacted]

990. Based on the customer outreach discussions and on what was learned in negotiations with customers [redacted], Illumina developed a standardized supply contract to offer to all of its U.S. oncology customers (the Open Offer.) (Berry (Illumina) Tr. 857, [redacted]

Response to Finding No. 990

[redacted]

[redacted]

991. On March 30, 2021, Illumina made the Open Offer available on its website for all for-profit U.S. oncology customers who purchase NGS products for developing and/or commercializing oncology tests. (deSouza (Illumina) Tr. 2338–39, 2401–02; Berry (Illumina) Tr. 688–89, 709–10; RX4003 (Illumina) at 1; PX0064 (Illumina); PX0087 (Illumina); PX0088 (Illumina); PX0089 (Illumina).)

Response to Finding No. 991

The proposed finding is inaccurate because Illumina's Open Offer is dated March 29, 2021.

992. While Illumina does not believe that the transaction will have any anticompetitive effect, it made the Open Offer available to address concerns raised by both Complaint Counsel and certain customers that the Illumina-GRAIL transaction would allow Illumina to foreclose GRAIL rivals. (*See* Berry (Illumina) Tr. 688–89, 709–10; deSouza (Illumina) Tr. 2338–39, 2401; Goswami (Illumina) Tr. 3207; PX0064 (Illumina) at 1; PX7122 (Eisenberg (LabCorp) Dep. at 107–08).)

Response to Finding No. 992

[redacted]

Further, this proposed finding is misleading and against the weight of evidence to the extent it purports to represent the views or opinions of Illumina's customers or Complaint Counsel about the Open Offer. The Open Offer does not address customers' or Complaint Counsel's concerns. [redacted]

[redacted]

993. Illumina has made the terms of the Open Offer available to any existing or new customer of Illumina that is a For-Profit Entity and purchases NGS products for developing and/or commercializing oncology tests. (PX0064 (Illumina) at 3.)

Response to Finding No. 993

This proposed finding is misleading to the extent it represents that the Open Offer is sufficient to allay its customers' concerns about the acquisition. [redacted]

[redacted]

[redacted]

993.1 A For-Profit Entity means a for-profit company in the United States that purchases Supplied Products for performing sequencing for liquid biopsy cancer screening or diagnostic tests for clinical oncology purposes, on human samples received from, and delivered to, unaffiliated health care professionals, health care organizations or other laboratories for clinical oncology purposes. (PX0064 (Illumina) at 3.) A For-Profit Entity excludes governments, government agencies, hospitals, research institutes, academic institutions, nonprofits and Illumina Affiliates (including GRAIL.) (PX0064 (Illumina) at 3.)

Response to Finding No. 993.1

Complaint Counsel acknowledges that Respondents' Open Offer letter dated March 29, 2021, includes the quoted language. The proposed finding is misleading to the extent it implies Illumina will abide by the terms of its Open Offer. As [redacted]

[redacted]

993.2 The Supplied Products are "Illumina's NextSeq, NextSeqDx and NovaSeq instruments, and any future sequencing instruments launched by Illumina or its Affiliates, or Sequencing Consumables, that are purchased by Customer for any Customer Use pursuant to the Supply Agreement." (PX0064 (Illumina) at 4–5.)

Response to Finding No. 993.2

[redacted]

[redacted]

993.3 Sequencing Consumables are "those consumables intended by Illumina to be used to perform a sequencing process on Illumina's NextSeq, NextSeqDx and NovaSeq instruments and any future sequencing hardware launched by Illumina or its Affiliates, and includes core consumables that are (i) commercialized or otherwise made available by Illumina to customers or Affiliates of Illumina and (ii) intended by Illumina to be used to perform a sequencing process on any such system. Sequencing Consumables do not include products that were at the 'end of life' or 'end of sale' or were announced (before January 1, 2021) to customers as a planned 'end of life' or 'end of sale'. Sequencing Consumables are limited to products that are shipped to and used in the United States." (PX0064 (Illumina) at 4.)

Response to Finding No. 993.3

[redacted]

[redacted]

993.4 The fact that the Open Offer is available to more than just MCED test developers makes the Open Offer more effective in protecting competition and limiting Illumina's ability to foreclose GRAIL rivals. (RX6002 (Guerin-Calvert Trial Dep. at 26–27).) It also makes the Open Offer easier to implement because it applies to a class of customers who are readily identifiable. (RX6002 (Guerin-Calvert Trial Dep. at 27).)

Response to Finding No. 993.4

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Ms. Guerin-Calvert as the only source of evidence supporting this fact in contravention of this Court's Order. This Court should disregard this evidence.

Further, Complaint Counsel restate the objection made at Ms. Guerin-Calvert's trial deposition and move to strike the cited testimony to the extent there's analysis of how other oncology customers may impose a constraint.

This proposed finding is also misleading and unsupported to the extent it purports to speak for the needs or opinions of MCED developers while relying solely on the self-serving testimony of Defendants' paid expert. [redacted]

[redacted]

994. For customers who signed the Open Offer before the close of the acquisition, the terms took effect on August 18, 2021, when the Illumina-GRAIL transaction closed; for others, the terms will take effect immediately upon signing. (PX0064 (Illumina) at 1.)

Response to Finding No. 994

This proposed finding is misleading to the extent it purports to represent what Illumina will do in the future. [redacted]

[redacted]

994.1 The Open Offer is irrevocable, binding and governed by New York law. (PX0064 (Illumina) at 1, 11) ("[t]his irrevocable offer is binding on Illumina.")

Response to Finding No. 994.1

The proposed finding is misleading to the extent it implies Illumina will abide by the terms of its Open Offer. As [redacted]

[redacted]

Ultimately, as [redacted]

994.2 Illumina executives have made several public commitments to the Open Offer, including under oath at this trial, thus giving reasons even beyond New York contract law for Illumina to adhere to the Open Offer. (*See, e.g.*, Berry (Illumina) Tr. 688–89, 709–10; deSouza (Illumina) Tr. 2338–39, 2401; Goswami (Illumina) Tr. 3207.)

Response to Finding No. 994.2

The proposed finding is vague because it does not define or describe which "public commitments" it is referring to.

The proposed finding is misleading to the extent it implies that trial testimony and public statements made by Illumina executives will make Illumina abide by the terms of its Open Offer.

As [redacted]

The proposed finding is misleading to the extent it implies that Illumina cares about its reputation enough that the public statements regarding the Open Offer will make them abide by the terms. The weight of the evidence shows that Illumina's reputation among its customers is already poor. [redacted]

[redacted] Invitae's Mr. Stahl and Singlera's Mr. Gao both testified that Illumina is the 800-pound gorilla as "Illumina control[s] the supply chain for all the NGS-based early cancer detection technology, not only for Singlera, but for other companies." (Gao (Singlera) Tr. 2951; PX7044 (Stahl (Invitae) IHT at 49-50); *see also* Gao (Singlera) Tr. 2947-48). Illumina "dominate[s]" the industry. (PX7044 (Stahl (Invitae) IHT at 49-50)).

Additionally, Illumina cares less about their reputation because customers have nowhere else to go and their actions to foreclose rivals may go undetected. [redacted]

[redacted]

Illumina has acknowledged that its reputation could suffer by closing the transaction in Europe but did it anyway. Illumina disclosed that consummating the transaction when it did could lead to "other adverse consequences to, among other things, its reputation[.]" (PX0378 at 005 (Illumina Form 8-K, Aug. 18, 2021); *see also* deSouza (Illumina) Tr. 2236-37 (stating that Illumina decided to close the transaction despite the potential risk to its reputation)). Therefore, this Court should disregard the proposed finding.

995. Existing or new customers of Illumina may sign the Open Offer at any time until 6 years after the close of Illumina's acquisition of GRAIL, which is August 18, 2027. (Berry (Illumina) Tr. 861–62.) Customers thus do not need to make a rapid decision whether to sign the Open Offer. (Nolan (Freenome) Tr. 2785.)

Response to Finding No. 995

The proposed finding is misleading to the extent it implies that Freenome's CEO, Mr. Nolan testified that Freenome has not signed the Open Offer because simply there is no hurry.

[redacted]

[redacted]

996. On September 8, 2021, Illumina amended the Open Offer to offer additional benefits and protections to customers. (RX3935 (Illumina) at 1; deSouza (Illumina) Tr. at 2405–06.) This addendum provided customers with greater protections in terms of pricing, access to products and services, and enforcement, as outlined below. (RX3935 (Illumina) at 2–3; deSouza (Illumina) Tr. at 2407–09.)

Response to Finding No. 996

The proposed finding is vague because it fails to define or describe what "additional benefits and protections" the amended Open Offer provides to customers. The proposed finding relies solely upon the self-serving testimony of Illumina's CEO, Francis deSouza. No other evidence or customer testimony is cited to explain whether these added terms, which were first presented in the middle of trial, are beneficial to customer and provide "protections." Therefore, this Court should disregard the proposed finding.

997. The Open Offer effectively addresses the concerns that FTC has raised that Illumina will have the incentive and ability to anticompetitively disadvantage GRAIL's rivals now that Illumina has re-acquired the remainder of GRAIL that it did not already own. (RX6002 (Guerin-Calvert Trial Dep. at 20–21).)

Response to Finding No. 997

The proposed finding is vague because it fails to define or describe the phrase "effectively address." The proposed finding relies solely upon the self-serving testimony of Respondents' paid expert, Ms. Guerin-Calvert, and does not cite to any customer with actual experience in the industry to support Respondents' proposed "fact."

The proposed finding is an improper legal conclusion which cites to no customer testimony or factual evidence to support its claim. [redacted]

[redacted]. Guardant's Mr. Getty testified, "the [open] offer that is put forward is nothing more than a paper tiger. It's very difficult to understand how that would alleviate our concerns about a combined GRAIL and Illumina organization," adding that "[u]ltimately, . . . we don't have an option." (PX7105 (Getty (Guardant) Dep. at 78-79)). [redacted]

[redacted]

997.1 The Open Offer provides the economically necessary terms to prevent the alleged anticompetitive harms from the transaction in both the short term and the long term. (RX6002 (Guerin-Calvert Trial Dep. at 21–22).)

Response to Finding No. 997.1

The proposed finding is vague because it fails to define or describe the phrase "economically necessary." The proposed finding relies solely upon the self-serving testimony of Respondents' paid expert, Ms. Guerin-Calvert, and does not cite to any customer with actual experience in the industry to support Respondents' proposed "fact."

Additionally, the proposed finding is misleading to the extent it implies that the Open Offer can account for every situation that may occur over the next 12-years. [redacted] Mr. Getty further testified that he is unaware of all the issues that Guardant may face with Illumina as its supplier over the next 12 years because Guardant is "in a rapidly-evolving space that, you know, has remained stagnant very infrequently. And so ultimately just by virtue of the nature of 12 years on, it's challenging to

see, but even in the sort of short term, it's difficult to even predict what's going to happen next month." (PX7105 (Getty (Guardant) Dep. 82)). Even Illumina's Ms. Berry testified that its "fair to assume" that it's difficult to know every situation that may take place over the course of a 12-year supply agreement because "there's a lot of dynamic things that are happening amongst [Illumina's] customers." (Berry (Illumina) Tr. 694; [redacted])

997.2 The Open Offer addresses the specific concerns about market power and related conduct raised by Complaint Counsel, its expert, Dr. Fiona Scott Morton, and certain Illumina customers. (RX6002 (Guerin-Calvert Trial Dep. at 22).)

Response to Finding No. 997.2

The proposed finding is vague because it fails to define or describe what "specific concerns," "market power," "related conduct," and "certain Illumina customers" Respondents are referring to. The proposed finding relies solely upon the self-serving testimony of Respondents' paid expert, Ms. Guerin-Calvert, and does not cite to any customer with actual experience in the industry or any customer actually subject to the Open Offer's terms to support Respondents' proposed "fact." Therefore, this Court should disregard the proposed finding.

997.3 The Open Offer provides a comprehensive set of protections for its customers for all aspects of conduct and competition including access, pricing and quality of products and services, and rights to develop distributable IVD kits on Illumina's FDA-regulated systems. (RX6002 (Guerin-Calvert Trial Dep. at 22, 94–95).)

Response to Finding No. 997.3

The proposed finding is vague because it fails to define or describe what "comprehensive," "all aspects of conduct and competition," "access," and "certain Illumina customers" Respondents are referring to. Nowhere in the Open Offer is the term "access" defined. (*See* PX0064 (Illumina, Open Offer Letter, Mar. 29, 2021)). The proposed finding relies solely upon the self-serving testimony of Respondents' paid expert, Ms. Guerin-Calvert, and does not cite to any customer with actual experience in the industry or any customer actually subject to the Open Offer's terms to support Respondents' proposed "fact." Therefore, this Court should disregard the proposed finding.

997.4 The Open Offer provides for effective monitoring and enforceability mechanisms. (RX6002 (Guerin-Calvert Trial Dep. at 22).)

Response to Finding No. 997.4

The proposed finding is vague because it fails to define or describe what "effective monitoring" and "enforceability mechanisms" mean. The proposed finding relies solely upon the self-serving testimony of Respondents' paid expert, Ms. Guerin-Calvert, and does not cite to any customer with actual experience in the industry or any customer actually subject to the Open Offer's terms to support Respondents' proposed "fact."

The proposed finding is misleading and against the weight of the evidence to the extent it implies that the Open Offer resolves customers concerns about the ability to monitor and enforce the agreement. Guardant's Mr. Getty testified further that "a contract is only as good as it is enforceable. And ultimately, you know, our ability – our ability, being Guardant's ability . . . to investigate adherence to the term of that contract is nearly impossible." (PX7105 (Getty (Guardant) Dep. at 79-80)). Mr. Getty explained the "nearly impossible" enforcement of a contract with Illumina: "A contract is only as good as it is enforceable. And ultimately, [Guardant's ability] to investigate adherence to the terms of that contract is nearly impossible."

(PX7105 (Getty (Guardant) Dep. at 79-80)).

998. Additionally, extrinsic aspects of the Open Offer will increase its enforceability. (RX6002 (Guerin-Calvert Trial Dep. at 22–23).)

Response to Finding No. 998

The proposed finding is vague because it fails to define or describe what "extrinsic aspects" of the Open Offer is referring to. The proposed finding relies solely upon the self-serving testimony of Respondents' paid expert, Ms. Guerin-Calvert, and does not cite to any customer with actual experience in the industry or any customer actually subject to the Open Offer's terms to support Respondents' proposed "fact." Therefore, this Court should disregard the proposed finding.

998.1 All of the provisions of the Open Offer are publicly known and publicly available because the Open Offer is posted on Illumina's website. (deSouza (Illumina) Tr. 2338–39, 2401; RX4003 (Illumina) at 1; PX0064 (Illumina); PX0087 (Illumina); PX0088 (Illumina); PX0089 (Illumina); PX7076 (Berry (Illumina) Dep. at 275–76.)

Response to Finding No. 998.1

The proposed finding is vague because it fails to define what "publicly known" means. Complaint Counsel does not disagree that Illumina's Open Offer is posted on Illumina's website.

The proposed finding is misleading to the extent Respondents are implying that any breach of the Open Offer will also be publicly known. The Open Offer's arbitration provision provides that arbitration proceedings shall be submitted to "confidential binding arbitration to determine final terms and conditions of the supply agreement, or to settle the dispute as to the terms of a supply agreement." (PX0064 at 010 (Illumina Open Offer agreement, Mar. 29, 2021)). Therefore, this Court should disregard the proposed finding to the extent it purports to describe what is "publicly known.

> 998.2 The letter accompanying the publicly available Open Offer indicates that the Open Offer's purpose is to allay concerns and constraining conduct that could competitively disadvantage rivals. (PX0064 (Illumina) at 1.)

Response to Finding No. 998.2

Complaint Counsel acknowledges that Respondents' Open Offer letter includes the provision that Illumina is providing the Open Offer "to allay any concerns relating to the Transaction, including that Illumina would disadvantage GRAIL's potential competitors after the Transaction by increasing their sequencing prices or by withholding access to Illumina's latest innovations in Next Generation Sequencing ("NGS")." (PX0064 at 001 (Illumina Open Offer agreement, Mar. 29, 2021)). However, the proposed finding is misleading to the extent that it implies the Open Offer actually resolves customer concerns. [redacted]

[redacted]

[redacted]

998.3 The Open Offer was made available to a large number of customers—all of Illumina's for-profit clinical oncology customers in the United States. (RX4003 (Illumina's Oncology Contract Terms Website) at 1.)

Response to Finding No. 998.3

This proposed finding is vague, unsupported, and misleading. This proposed finding is vague and unsupported because neither the proposed finding nor the cited document define a "large number" of customers.

This proposed finding is misleading to the extent it represents that the Open Offer is sufficient to allay its customers' concerns about the acquisition. [redacted]

[redacted]

998.4 All of these extrinsic aspects of the Open Offer—its publicness, its strong preamble and its availability to a large number of customers—exert external pressure to make the Open Offer more effective. (RX6002 (Guerin-Calvert Trial Dep. at 22–23).)

Response to Finding No. 998.4

The proposed finding is vague because it fails to define or describe what "extrinsic aspects" of the Open Offer it is referring to. Additionally, it is vague because it fails to define or describe what the terms and phrases "publicness," "strong preamble," and "exert external pressure" mean.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Ms. Guerin-Calvert as the only source of evidence supporting this fact in contravention of this Court's Order. This Court should disregard this evidence.

This proposed finding is also misleading and unsupported to the extent it purports to speak for the needs or opinions of Illumina's customers while relying solely on the self-serving testimony of Defendants' paid expert. [redacted]

[redacted]

998.5 [redacted]

Response to Finding No. 998.5

[redacted]

[redacted]

[redacted]

998.6 [redacted]

Response to Finding No. 988.6

[redacted]

[redacted]

999. The Open Offer also represents an improvement for customers over the premerger status quo. (RX6002 (Guerin-Calvert Trial Dep. at 37, 52–53, 57); *see also* RX6000 (Carlton Trial Dep. at 48).)

Response to Finding No. 999

The proposed finding is vague because it fails to define or describe the term "improvement" and the phrase "premerger status quo."

[redacted]

The proposed finding is misleading to the extent it implies that the Open Offer is sufficient because it provides customers with terms they have not had in the past. Prior to the Acquisition, Illumina contracted with customers at arms-length. Post-Acquisition, Illumina is now interacting with customers as rivals and the incentives behind how Illumina treats customer have changed. [redacted]

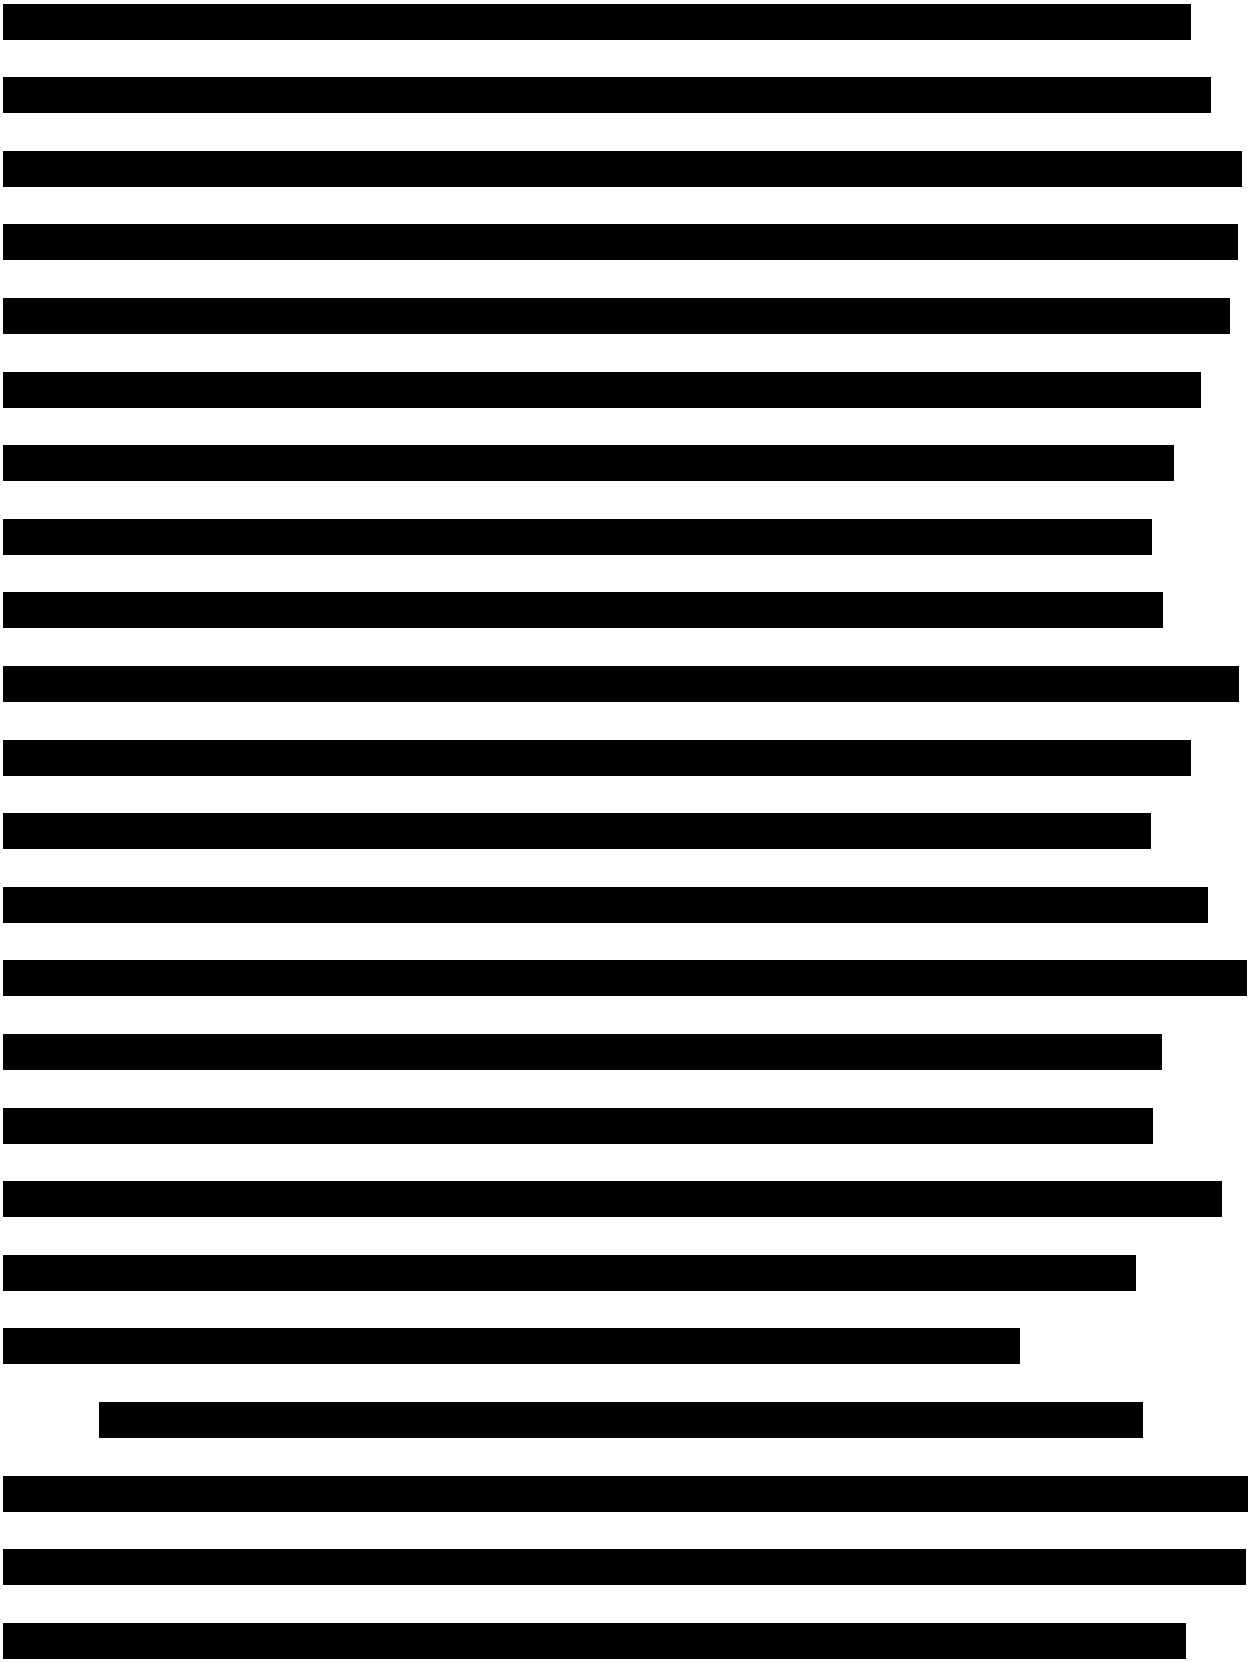
C. Illumina's Binding Commitments in the Open Offer

1. Term, Unilateral Termination, and Purchase Orders

1000. The Open Offer provides for a 12–year supply contract for the Supplied Products. (Berry (Illumina) Tr. 690–91, 861, 874–75; Conroy (Exact/Thrive) Tr. 1725; deSouza (Illumina) Tr. 2402; PX0064 (Illumina) at 5.)

Response to Finding No. 1000

Complaint Counsel acknowledges that Respondents' Open Offer states that its term is for 12-years. (PX0064 at 005 (Illumina, Open Offer Letter, Mar. 29, 2021)). [redacted]



[redacted]

1000.1 The Open Offer "shall be effective for twelve (12) years from the closing of the Transaction, regardless of the date either party signs this Supply Agreement." (PX0064 (Illumina) at 5.) Therefore, the Open Offer and Addendum are in effect until August 18, 2033 for any customer that signs these agreements. (PX0064 (Illumina) at 5; PX0378 (Illumina) at 3.)

Response to Finding No. 1000.1

Complaint Counsel has no specific response to the finding that the Open Offer has a term of 12 years. The proposed finding is misleading to the extent that it implies Illumina will abide by any signed agreements until August 18, 2033. Mr. Getty testified that "a contract is only as good as it is enforceable. And ultimately, you know, our ability – our ability, being Guardant's ability . . . to investigate adherence to the term of that contract is nearly impossible." (PX7105 (Getty (Guardant) Dep. at 79-80)). [redacted]

1000.2 The Open Offer's 12–year term is longer than the typical agreements between Illumina and its customers in the pre-merger world, though some customers entered into long-term agreements with Illumina in the past. (Berry (Illumina) Tr. 690–91.) The 12–year term was chosen to assure customers that Illumina was absolutely invested in maintaining longstanding relationships with these customers as a technology provider. (Berry (Illumina) Tr. 862.)

Response to Finding No. 1000.2

The proposed finding is misleading to the extent it implies that the Open Offer is sufficient because it provides customers with terms they have not had in the past. Prior to the Acquisition, Illumina contracted with customers at arms-length. Post-Acquisition, Illumina is now interacting with customers as rivals and the incentives behind how Illumina treats customer

have changed. [redacted] Guardant's Mr. Getty testified that he does not think a contract between Guardant and Illumina could eliminate Illumina's incentives to favor Grail. (PX7105 (Getty (Guardant) Dep. at 79-80)). [redacted]

The proposed finding is also misleading to the extent it implies the length of the open offer is sufficient to anticipate the changes over the next decade. As [redacted] (CCFF ¶ 4966). [redacted]

[redacted]

Lastly, the proposed finding relies solely upon the self-serving testimony of Illumina's Senior Vice President and General Manager of Americas and the Open Offer signatory, Nicole Berry. No other evidence is cited explained why a 12-year terms was selected. Therefore, this Court should disregard the proposed finding.

> 1000.3 A 12–year term is consistent with what is normally provided in consent decrees that the FTC and the DOJ have approved historically. (RX6002 (Guerin-Calvert Trial Dep. at 28); *see, e.g.*, RX3082 (*In re Broadcom Ltd.* Decision and Order) at 11; RX3664 (*In re Sycamore Partners II* Analysis of Agreement Containing Consent Order) at 4).)

Response to Finding No. 1000.3

The proposed finding is vague because it fails to define what "normally provided" means. Additionally, the proposed finding is misleading to the extent it implies that the Open Offer is sufficient because it provides customers with terms they have not had in the past. Prior to the Acquisition, Illumina contracted with customers at arms-length. Post-Acquisition, Illumina is now interacting with customers as rivals and the incentives behind how Illumina treats customer have changed. [redacted] Guardant's Mr. Getty testified that he does not think a contract between Guardant and Illumina could eliminate Illumina's incentives to favor Grail. (PX7105 (Getty (Guardant) Dep. at 79-80)). [redacted]

[redacted]

The Commission's decision to accept a remedy or block a transaction is based on the facts in that matter, not the actions taken in a different matter with different facts. The operative question is not what the Commission has done in the past; it is whether the Respondents' Open Offer fully restores the competitive status quo that existed prior to the merger. For all of the reasons Complaint Counsel explained in its Post-Trial brief, Respondents have failed to answer this question. [redacted] Therefore, this Court should disregard the proposed finding.

> 1000.4 The 12–year term is an improvement on the status quo, in which many customers do not have supply agreements and those that do have supply agreements have shorter term agreements. (RX6002 (Guerin-Calvert Trial Dep. at 29); PX7085 (Harada (Exact/Thrive) Dep. at 94).)

Response to Finding No. 1000.4

The proposed finding is misleading to the extent it implies that the Open Offer is sufficient because it provides customers with terms they have not had in the past. Prior to the Acquisition, Illumina contracted with customers at arms-length. Post-Acquisition, Illumina is now interacting with customers as rivals and the incentives behind how Illumina treats customer have changed. [redacted] Guardant's Mr. Getty testified that he does not think a contract

between Guardant and Illumina could eliminate Illumina's incentives to favor Grail. (PX7105 (Getty (Guardant) Dep. at 79-80)).

1000.5 The 12–year term provides customers with long-term protections and gives customers certainty about price, quality, access and conduct for the next 12 years. (RX6002 (Guerin-Calvert Trial Dep. at 28–29).)

Response to Finding No. 1000.5

The proposed finding is vague because it fails to define "customer[] certainty," "quality," "access," and "conduct." The proposed finding is misleading and against the weight of the evidence. For example,

[redacted]

Even the signatory of the Open Offer admitted to the failures of Illumina's long-term supply agreement. Illumina's own executive and Open Offer signatory, Nicole Berry, testified that customers would not know how fast its competitors receive service and support from Illumina. (PX7076 (Berry (Illumina) Dep. at 292)); *see also* PX7105 (Getty (Guardant) Dep. at 69-71) (testifying that Illumina could "say simple things like 'We can't get a technician out to your sequencers until next Friday' or 'the Friday after,' and that could create challenges around turnaround time and disappoint customers and therefore hurt us competitively.")). Ms. Berry testified that Illumina's customers would not know whether they have access to prerelease products at the same time as Grail "unless Illumina proactively communicated such." (Berry (Illumina) Tr. 701). Ms. Berry testified at trial that Section 4(c) of the open offer does not prevent GRAIL from having knowledge of Illumina's new technology before other companies developing oncology tests. (Berry (Illumina) Tr. 708). Under the open offer, Grail can learn the specifications of new Illumina sequencers before its rival MCED test developers. (Berry (Illumina) Tr. 708). Ms. Berry testified that if Illumina does introduce an instrument with a

higher throughput than the NovaSeq, currently Illumina's highest throughput instrument, then the 43 percent price decrease would only apply to that new, higher throughput sequencer. (Berry (Illumina) Tr. 712). Therefore, this Court should disregard the proposed finding.

1000.6 The 12–year term allows customers to plan for the long term more effectively. (Fiedler (FMI) Tr. 4485; RX6002 (Guerin-Calvert Trial Dep. at 28–29).)

Response to Finding No. 1000.6

The proposed finding is against the weight of the evidence to the extent it implies customers can plan for the future of their cancer screening products because of Illumina's long-term supply agreement. [redacted] Further, Ms. Berry testified that its "fair to assume" that it's difficult to know every situation that may take place over the course of a 12-year supply agreement because "there's a lot of dynamic things that are happening amongst [Illumina's] customers." (Berry (Illumina) Tr. 694).

[redacted]

[redacted]

The proposed finding relies solely upon the self-serving testimony of Respondents' paid expert, Ms. Guerin-Calvert, and does cite to any customer with actual knowledge of Illumina's long-term supply agreement to support Respondents' apparent "fact." Ms. Guerin-Calvert made $1,370 per hour for her work on this matter and as of one week prior to her trial deposition, had billed approximately 300 hours on this matter. (RX6002 (Guerin-Calvert Trial Dep. at 110-11)). Therefore, this Court should disregard the proposed finding.

> 1000.7 The 12–year term is long enough to address the foreclosure concerns and alleged competitive harms from the merger. (RX6002 (Guerin-Calvert Trial Dep. at 29–30).)

Response to Finding No. 1000.7

The proposed finding relies solely upon the self-serving testimony of Respondents' paid expert, Ms. Guerin-Calvert, and does cite to any customer with actual knowledge of Illumina's long-term supply agreement to support Respondents' apparent "fact."

This proposed finding is misleading to the extent it implies any customers testified that a 12-year supply agreement is long enough to resolve their concerns regarding the Acquisition.

[redacted]

[redacted]

1001. Under the Open Offer, Customers can terminate the supply relationship with Illumina at any time and without specifying any reason. (Berry (Illumina) Tr. 862–63; deSouza (Illumina) Tr. 2402; PX0064 (Illumina) at 10.)

Response to Finding No. 1001

The proposed finding is misleading to the extent that it implies the Customer has no prerequisites which must be fulfilled before the Customer can terminate the Illumina supply agreement. Specifically, section 11 of Illumina's March 29, 2021 Open Offer letter states that a customer must provide "ninety (90) days' prior written notice to Illumina" in order to terminate the agreement "without termination liability." (PX0064 at 010 (Illumina Open Offer agreement, Mar. 29, 2021)). No definition for "termination liability" is provided in the Open Offer. (PX0064 (Illumina Open Offer agreement, Mar. 29, 2021)).

Additionally, the proposed finding is vague because "Customer" is used as a defined term

but Respondents fail to provide a definition. Therefore, this Court should disregard the proposed finding.

> 1001.1 The Open Offer requires that "Customer has a unilateral right to terminate its supply relationship with Illumina at any time and for any reason without termination liability upon ninety (90) days' prior written notice to Illumina, provided, however, that Customer shall honor all invoices, which invoices shall be issued upon shipment, for Supplied Products ordered under a Purchase Order that was accepted by Illumina prior to the termination date." (PX0064 (Illumina) at 10.)

Response to Finding No. 1001.1

Complaint Counsel acknowledges that Respondents' Open Offer letter includes the quoted language. The term "requires," however is misleading to the extent it implies that Illumina cannot breach the terms of the Open Offer. As [redacted]

> 1001.2 The 90–day notice period provision is intended to be as "customer friendly as possible". (Berry (Illumina) Tr. 863.)

Response to Finding No. 1001.2

The proposed finding is vague because it fails to define or explain what as "customer friendly as possible."

The proposed finding is misleading and against the weight of the evidence which shows that Illumina's reputation is already poor. [redacted]

[redacted] Illumina's customers agree. For example, [redacted] Given Illumina's poor reputation, customers must be careful in their dealings with Illumina. As [redacted]

The proposed finding is unsupported because the Open Offer itself makes no mention of the termination provision or any other provision of the agreement being "customer friendly." As Ms. Berry testified the customer has to rely on the "spirt" of the contract as there is no such protection written into the terms of the agreement. (PX7076 (Berry (Illumina) Dep. at 297 (Q. So

from your understanding, a customer's suspicion that Illumina is violating the open offer would arise to the level of a good faith basis? A. I believe that's the spirit with which this 12(a) is written. Q. And how would customers be aware of the spirit? A. I'm not sure that there's a basis for them to be aware of the spirit.")).

Lastly, the proposed finding relies solely upon the self-serving testimony of Illumina's Senior Vice President and General Manager of Americas and the Open Offer signatory, Nicole Berry. No other evidence is cited to explain how the termination clause is "customer friendly." Therefore, this Court should disregard the proposed finding.

1002. The Open Offer requires that "Illumina cannot terminate this Supply Agreement for convenience during the Term." (PX0064 (Illumina) at 10; *see also* (Berry (Illumina) Tr. 863; deSouza (Illumina) Tr. 2402.)

Response to Finding No. 1002

Complaint Counsel acknowledges that Respondents' Open Offer letter includes the quoted language. The term "for convenience," however is vague because it is not defined in the Open Offer. It is unclear and uncertain whether Illumina could terminate the Supply Agreement for a purpose that does not meet this "convenience" requirement. As [redacted]

[redacted]

1002.1 This asymmetry in the termination provisions addresses the alleged anticompetitive effects and foreclosure concerns related to the merger: Because Illumina cannot exit the agreement, its conduct will be restrained over the entire 12–year term, but the customer enjoys the benefit of being able to switch to alternative suppliers for sequencing instruments or consumables at any time. (RX6002 (Guerin-Calvert Trial Dep. at 30–31).)

Response to Finding No. 1002.1

The proposed finding is misleading to the extent it implies there is a "asymmetry in the termination provisions" included in the Open Offer and that Illumina cannot exit the agreement. The language of the termination provision included in the open offer uses several terms which are undefined by Respondents and leave loopholes for Illumina to exit the agreement and mess with customers. For example, Respondents provide no definition for "termination liability," "for convenience," and "materially breaches." (PX0064 at 010 (Illumina, Open Offer Letter, Mar. 29, 2021)). The term "for convenience," is vague because it is not defined in the Open Offer. It is unclear and uncertain whether Illumina could terminate the Supply Agreement for a purpose that does not meet this "convenience" requirement.

The proposed finding is misleading and against the weight of the evidence to the extent it implies that MCED customers have an "alternative supplier[]" to switch to. [redacted]

[redacted] Singlera's Dr. Gao described Singlera's relationship with Illumina as like being a "prisoner of war." (PX7042 (Gao (Singlera) IHT at 88)). Dr. Chahine testified that Helio has "looked at different providers. I don't want to say technically we couldn't, but the truth is that the entire category uses Illumina. We're very familiar with Illumina. … The cost is much lower. … [T]here are just a number of … technical advantages and just performance." (PX7077 (Chahine (Helio) Dep. at 26)).

Lastly, the proposed finding relies solely upon the self-serving testimony of Respondents' paid expert, Ms. Guerin-Calvert, and does cite to any customer with actual experience in the industry to support Respondents' apparent "fact." Therefore, this Court should disregard the proposed finding.

1003. The Open Offer is "not contingent on any purchase commitments by Customer, nor does it affect Customer's existing unilateral right to terminate its supply relationship with Illumina at any time and for any reason." (PX0064 (Illumina) at 9; *see also* Berry (Illumina) Tr. 864–65.)

Response to Finding No. 1003

Complaint Counsel acknowledges that the quoted language is included in Illumina's open offer agreement published on March 29, 2021. The proposed finding is misleading to the extent it implies that a customer has no prerequisites to termination of the agreement. Respondents acknowledge in their own finding 1001.1 that the customers must provide "ninety (90) days' prior written notice to Illumina" in order to avoid "termination liability." Termination liability is an undefined term. (PX0064 at 010 (Illumina Open Offer agreement, Mar. 29, 2021)). Therefore, this Court should disregard the proposed finding.

> 1003.1 The Offer also requires that "[w]ritten purchase orders ("Purchase Orders") submitted in accordance with this Supply Agreement, Illumina's Terms and Conditions, or an operative supply agreement may be rejected by Illumina only if Illumina does not have sufficient supply of the applicable Supplied Product to fulfill the order or if the Purchase Order is not in accordance with standard lead times for the applicable Supplied Product." (PX0064 (Illumina) at 9.)

Response to Finding No. 1003.1

Complaint Counsel acknowledges that Respondents' Open Offer letter includes the quoted language. The term "sufficient supply," however is vague because it is not defined in the Open Offer. It is unclear and uncertain what constitutes sufficient supply and leaves loopholes for Illumina to mess with customers supply. [redacted]

Moreover, the proposed finding is misleading to the extent it implies that Illumina cannot breach the terms of the Open Offer. As [redacted]

[redacted]

2. **Uninterrupted and Timely Access to Services**

1004. Under the Open Offer, Illumina must provide customers with the same access to services that GRAIL or any other For-Profit Entity has access to, at the same prices. [redacted]; Berry (Illumina) Tr. 865–66; deSouza (Illumina) Tr. 2404; PX0064 (Illumina) at 6; RX3935 (Illumina) at 2.)

Response to Finding No. 1004

[redacted]

[redacted]

[redacted]

[redacted]

1004.1 The Open Offer requires that "Customer shall have access to the same product services and support services for purchase relating to the Supplied Products to which GRAIL or any For-Profit Entity has access, or which Customer had access before the Transaction." (PX0064 (Illumina) at 6.)

Response to Finding No. 1004.1

Complaint Counsel acknowledges that Respondents' Open Offer letter includes the quoted language. The term "requires," however is misleading to the extent it implies that Illumina cannot breach the terms of the Open Offer. As [redacted]

Additionally, the proposed finding is vague as the Open Offer does not define "product services" or "support services." (PX0064 § 4.a. (Illumina, Open Offer Letter, Mar. 29, 2021)). The Open Offer does not explain how such services could be measured to ensure consistency in treatment between Grail and its rivals. (*See* PX0064 (Illumina, Open Offer Letter, Mar. 29, 2021)). Nowhere in the Open Offer is the term "access" defined. (*See* PX0064 (Illumina, Open Offer Letter, Mar. 29, 2021)).

The proposed finding is misleading to the extent it implies customers will be able to know what services Illumina is providing to Grail and other Illumina customers. [redacted])). Mr. George, Invitae's CEO, testified that under Open Offer term 4(a) it is "not clear" how Invitae will know they are receiving access to the same product services and support services as GRAIL. (PX7081 (George (Invitae) Dep. at 93-94)).

Even Illumina's own executive and Open Offer signatory, Nicole Berry, testified that customers would not know how fast its competitors receive service and support from Illumina. (PX7076 (Berry (Illumina) Dep. at 292)); *see also* PX7105 (Getty (Guardant) Dep. at 69-71) (testifying that Illumina could "say simple things like 'We can't get a technician out to your

sequencers until next Friday' or 'the Friday after,' and that could create challenges around turnaround time and disappoint customers and therefore hurt us competitively.")) Additionally, Respondents' own expert, Ms. Guerin-Calvert, agreed that an Illumina customer is not well positioned to compare the services it receives from Illumina with the services that its competitor receives. (RX6002 (Guerin-Calvert Trial Dep. at 152); *see also* CCFF ¶¶ 4508-09). Therefore, this Court should disregard the proposed finding.

> 1004.2 The Open Offer also requires that "[f]or such services, Customer shall have access to the same volume-based pricing that GRAIL has access to for the equivalent level of service, or to which Customer had access before the transaction, at the Customer's option." (RX3935 (Illumina) at 2.)

Response to Finding No. 1004.2

Complaint Counsel acknowledges that Respondents' Amended Open Offer letter dated September 8, 2021 includes the quoted language. Respondents' revised the terms of its Open Offer letter during the middle of trial. Moreover, the term "requires," is misleading to the extent it implies that Illumina cannot breach the terms of the Open Offer. As [redacted]

[redacted].

The proposed finding is vague because the terms "access," "equivalent level," and "service" are not defined. Nowhere in the Open Offer is the term "access" defined. (*See* PX0064 (Illumina, Open Offer Letter, Mar. 29, 2021)). The Open Offer does not explain how such services could be measured to ensure consistency in treatment between Grail and its rivals. (*See* PX0064 (Illumina, Open Offer Letter, Mar. 29, 2021)).

The proposed finding is misleading to the extent it implies customers will be able to know what services and at what price Illumina is providing to Grail and other Illumina customers. [redacted]). Mr. George, Invitae's CEO, testified that under Open Offer term 4(a) it is "not clear" how Invitae will know they are receiving access to the same product services and support services as GRAIL. (PX7081 (George (Invitae) Dep. at 93-94)).

Even Illumina's own executive and Open Offer signatory, Nicole Berry, testified that customers would not know how fast its competitors receive service and support from Illumina. (PX7076 (Berry (Illumina) Dep. at 292)); *see also* PX7105 (Getty (Guardant) Dep. at 69-71)

(testifying that Illumina could "say simple things like 'We can't get a technician out to your sequencers until next Friday' or 'the Friday after,' and that could create challenges around turnaround time and disappoint customers and therefore hurt us competitively.")). Additionally, Respondents' own expert, Ms. Guerin-Calvert, agreed that an Illumina customer is not well positioned to compare the services it receives from Illumina with the services that its competitor receives. (RX6002 (Guerin-Calvert Trial Dep. at 152); *see also* CCFF ¶¶ 4508-09). Therefore, this Court should disregard the proposed finding.

> 1004.3 Illumina customers can purchase 3 different levels of service contracts—gold, silver or bronze. (Berry (Illumina) Tr. 681–82.) The different levels of service contracts vary based on considerations like response times and the number of instances that Illumina technicians will proactively service the customer's instruments. (Berry (Illumina) Tr. 682.)

Response to Finding No. 1004.3

Complaint Counsel acknowledges that customers have different levels of service contracts with Illumina. However, the proposed finding is misleading and incomplete to the extent it implies Illumina only has three levels of services contracts – gold, silver, or bronze.

[redacted]

> 1004.4 To comply with the access-to-services provision and ensure consistency in treatment, Illumina keeps track of services that customers order using service contract SKUs. (Berry (Illumina) Tr. 866–68.) When a customer purchases a service SKU, there is an agreement that describes aspects of the service relationship such as turnaround time and the number of preventative maintenances to which a customer is entitled. (Berry (Illumina) Tr. 867.) As with products, there is a standard list of orderable service SKUs, each associated with a standard U.S. list price. (Berry (Illumina) Tr. 868–69.)

Response to Finding No. 1004.4

The proposed finding is vague because "access-to-services provision" is undefined, and it is unclear what provision this is referring to. The proposed finding is also vague because "consistency in treatment" is undefined and unclear. It is unclear how similar a customer's "treatment" needs to be to qualify as being consistent.

The proposed finding relies solely upon the self-serving testimony of Illumina's Senior Vice President and General Manager of Americas, and the Open Offer signatory, Nicole Berry. No customer testimony, documents, or written policies and procedures support Respondents' proposed "fact."

[redacted]

> 1004.5 Illumina has a long and sophisticated onboarding process when it hires new service technicians, which helps ensure that service quality among technicians is consistent. (Berry (Illumina) Tr. 869–70.) It also ensures consistent service among technicians by tracking individual cases to determine whether there is any gap in performance between service engineers. (Berry (Illumina) Tr. 870–71.)

Response to Finding No. 1004.5

The proposed finding is vague because it fails to define or describe Illumina's "long and sophisticated onboarding process." The proposed finding is vague because it fails to describe

how Illumina's "onboarding process" "helps ensure that service quality among technicians is consistent."

The proposed finding is vague because it fails to define or describe what "consistent" means. The proposed finding is also misleading to the extent that it implies "consistent" means identical. [redacted]

The proposed finding relies solely upon the self-serving testimony of Illumina's Senior Vice President and General Manager of Americas, and the Open Offer signatory, Nicole Berry. No documents or written policies and procedures support Respondents' proposed "fact." Therefore, this Court should disregard the proposed finding.

> 1004.6 In order to ensure that it satisfies its obligations when a customer orders a service SKU, Illumina measures its customer support using key performance indicators (KPIs). (Berry (Illumina) Tr. 867–68.) These KPIs include metrics like instrument downtime or the length of time between when a case is opened to when it is closed. (Berry (Illumina) Tr. 867–68.) These KPIs enable Illumina to compare how it performs in terms of service and support across individual customers or groups of customers. (Berry (Illumina) Tr. 868.)

Response to Finding No. 1004.6

The proposed finding is vague because it fails to describe the various "key performance indicators (KPI)" that Illumina uses.

[redacted]

The proposed finding relies solely upon the self-serving testimony of Illumina's Senior Vice President and General Manager of Americas, and the Open Offer signatory, Nicole Berry. No documents or written policies and procedures support Respondents' proposed "fact." Therefore, this Court should disregard the proposed finding.

> 1004.7 If Illumina delayed or refused to service an instrument that belonged to a customer who had signed the Open Offer, Illumina would be in breach of the agreement. (Berry (Illumina) Tr. 871.) Illumina would also be in breach if it provided worse services to a customer laboratory who did not also purchase Galleri. (Berry (Illumina) Tr. 879.) Moreover, refusing to service instruments would hurt Illumina's overall business because customers would stop buying kits from Illumina. (Berry (Illumina) Tr. 871–72.)

Response to Finding No. 1004.7

The proposed finding is misleading to the extent it implies that Illumina customers will know whether Illumina breaches the Open Offer by delaying or refusing to provide service and that Illumina customers know what services are being provided to other Illumina customers. First, the Open Offer does not define "product services" or "support services." (PX0064 § 4.a. (Illumina, Open Offer Letter, Mar. 29, 2021)). Second, The Open Offer does not explain how such services could be measured to ensure consistency in treatment between Grail and its rivals. (*See* PX0064 (Illumina, Open Offer Letter, Mar. 29, 2021)). [redacted]

[redacted]

[redacted]

[redacted]

Lastly, Illumina has already shown that it is willing to risk harm to its reputation to secure ownership of Grail and its future profits. Specifically, Illumina acknowledged that consummating the transaction during the pendency of the European Commission's review could lead to "other adverse consequences to, among other things, its reputation," but Illumina chose to do so anyway. (PX0378 at 005 (Illumina Form 8-K, Aug. 18, 2021); *see also* deSouza (Illumina) Tr. 2236-37 (stating that Illumina decided to close the transaction despite the potential risk to its reputation)). Therefore, this Court should disregard the proposed finding.

1004.8 The Open Offer's equal services commitment places customers who have never had a supply agreement and who purchase subject to a purchase order in a superior

position to the pre-merger status quo by removing the uncertainty of accessing Illumina's servicing resources. (RX6002 (Guerin-Calvert Trial Dep. at 57).)

Response to Finding No. 1004.8

[redacted]

1004.9 The equal services commitment ensures that customers will receive at least the same level of service that they did before the merger. (RX6002 (Guerin-Calvert Trial Dep. at 58).)

Response to Finding No. 1004.9

This Court held that experts shall not be cited to "support factual proposition that should be established by fact witnesses or documents." Here Respondents cite Ms. Guerin-Calvert in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3. This Court should disregard this evidence.

[redacted]

[redacted]

1004.10 The commitment also addresses the concern that customers could suffer a delay in support services because the commitment requires that customers receive the same quality and type of services. (RX6002 (Guerin-Calvert Trial Dep. at 58–59).)

Response to Finding No. 1004.10

This Court held that experts shall not be cited to "support factual proposition that should be established by fact witnesses or documents." Here Respondents cite Ms. Guerin-Calvert in contravention of this Court's Order. *See* Order on Post-Trial Findings at 3. This Court should disregard this evidence.

Moreover, the proposed finding is misleading to the extent it implies customers know the quality and type of services received by other Illumina customers. [redacted]

[redacted])). Mr. George, Invitae's CEO, testified that under Open Offer term 4(a) it is "not clear" how Invitae will know they are receiving access to the same product services and support services as GRAIL. (PX7081 (George (Invitae) Dep. at 93-94)).

Even Illumina's own executive and Open Offer signatory, Nicole Berry, testified that customers would not know how fast its competitors receive service and support from Illumina. (PX7076 (Berry (Illumina) Dep. at 292)); *see also* PX7105 (Getty (Guardant) Dep. at 69-71) (testifying that Illumina could "say simple things like 'We can't get a technician out to your sequencers until next Friday' or 'the Friday after,' and that could create challenges around turnaround time and disappoint customers and therefore hurt us competitively.")). Additionally, Respondents' own expert, Ms. Guerin-Calvert, agreed that an Illumina customer is not well positioned to compare the services it receives from Illumina with the services that its competitor receives. (RX6002 (Guerin-Calvert Trial Dep. at 152); *see also* CCFF ¶¶ 4508-09).

The proposed finding is misleading to the extent it implies customers can account for service delays. For example, Guardant's testified that Illumina could "say simple things like 'We can't get a technician out to your sequencers until next Friday' or 'the Friday after,' and that

could create challenges around turnaround time and disappoint customers and therefore hurt us competitively." (PX7105 (Getty (Guardant) Dep. at 69-71)). Therefore, this Court should disregard the proposed finding.

3. Uninterrupted and Timely Access to the Latest Sequencing Instruments and Core Consumables

1005. The Open Offer provides customers the same access to purchase sequencing instruments and core consumables to which GRAIL has access. (Rabinowitz (Natera) Tr. 421; Berry (Illumina) Tr. 878–79; deSouza (Illumina) Tr. 2434–35, 2437–38; PX0064 (Illumina) at 6; RX3935 (Illumina) at 2.)

Response to Finding No. 1005

The proposed finding is vague because it does not define or describe what "access" means and nowhere in the Open Offer is the term "access" defined. (*See* PX0064 (Illumina, Open Offer Letter, Mar. 29, 2021)). Additionally, "access" is not defined in Illumina's additional supply agreement terms which were presented in the middle of trial. (RX3935 at 001-002 (Illumina, Revised Open Offer Letter, Sept. 8, 2021)).

[redacted]

1005.1 The Open Offer requires that "Customer shall have access to the Supplied Products for purchase that GRAIL . . . has access, within 5 days of when GRAIL . . . is offered such access (if not earlier) for purchase." (RX3935 (Illumina) at 2.)

Response to Finding No. 1005.1

Complaint Counsel acknowledges that Respondents' Additional Supply Agreement Terms to the Open Offer, which was presented for the first time in the middle of trial, includes

the quoted language. The proposed finding is vague because it does not define or describe what "access" means and nowhere in the Open Offer is the term "access" defined. (*See* PX0064 (Illumina, Open Offer Letter, Mar. 29, 2021)). Additionally, "access" is not defined in Illumina's additional supply agreement terms which were presented in the middle of trial. (RX3935 at 001-002 (Illumina, Revised Open Offer Letter, Sept. 8, 2021)).

[redacted]

1005.2 For example, if Illumina created a "NovaSeq-3", there is no way that it could provide it to GRAIL (meaningfully) ahead of potential competitors because

everyone would receive access to it within 5 days of GRAIL receiving access. (deSouza (Illumina) Tr. 2448.)

Response to Finding No. 1005.2

The proposed finding is vague because it fails to define or describe what the caveat "meaningfully" means.

[redacted]

1005.3 Illumina will ensure that GRAIL does not get access to a sequencing instrument or core consumable before other customers get access because Illumina is designing its organization to prevent leaks between Illumina and GRAIL. (Berry (Illumina) Tr. 878.)

Response to Finding No. 1005.3

This proposed finding is unsupported, vague, and misleading. Ms. Berry testified that it was "her understanding" that Illumina was "designing . . . [the] organization to prevent such leaks," Berry (Illumina) Tr. 878.), but did not and could not predict what Illumina will do or

"ensure" in the future. Further, the phrase "designing its organization" is vague and undefined. The proposed finding is also unsupported to the extent it attempts to speak to the concerns of Illumina's customers while relying solely on the speculative and self-serving testimony of an Illumina executive.

The proposed finding is vague because it does not define or describe what "access" means and nowhere in the Open Offer is the term "access" defined. (*See* PX0064 (Illumina, Open Offer Letter, Mar. 29, 2021)). Additionally, "access" is not defined in Illumina's additional supply agreement terms which were presented in the middle of trial. (RX3935 at 001-002 (Illumina, Revised Open Offer Letter, Sept. 8, 2021)).

The proposed finding is misleading to the extent it implies that Illumina can design its organization to prevent leaks between Illumina and GRAIL. [redacted]

[redacted]

The proposed finding is also misleading to the extent it implies that customers will be able to effectively enforce a breach of the Open Offer. If customers are able to discover a potential breach by Illumina of the Open Offer, the Open Offer explicitly provides that they must submit the matter to "confidential binding arbitration." (PX0064 at 008 (Illumina Open Offer Agreement, March 29, 2021)). Because enforcement of the Open Offer is confidential, other customers and industry participants would not learn of the breach. Thus, Illumina ensured, through its unilaterally imposed contractual terms, that its reputation cannot be harmed if it breaches the Open Offer. In addition, Illumina can breach the Open Offer in subtle ways that will likely go undetected. [redacted]

Additionally, Illumina does not care much about its reputation with MCED customers because MCED customers have nowhere else to go. [redacted]

[redacted] Singlera's Mr. Gao testified at trial that Illumina is the "800-pound" gorilla as "Illumina control[s] the supply chain for all the NGS-based early cancer detection technology, not only for Singlera, but for other companies." (Gao (Singlera) Tr. 2947-48; *see also* PX7042 (Gao (Singlera) IHT) at 88 (describing Singlera's relationship with Illumina as like being a "prisoner of war")).

Lastly, Illumina has already shown that it is willing to risk harm to its reputation to secure ownership of Grail and its future profits. Specifically, Illumina acknowledged that consummating the transaction during the pendency of the European Commission's review could lead to "other adverse consequences to, among other things, its reputation," but Illumina chose to do so anyway. (PX0378 at 005 (Illumina Form 8-K, Aug. 18, 2021); *see also* deSouza (Illumina) Tr. 2236-37 (stating that Illumina decided to close the transaction despite the potential risk to its reputation)). Therefore, this Court should disregard the proposed finding.

> 1005.4 Further, customers can ensure that Illumina adheres to this provision because the Open Offer requires Illumina to publish and update information about the products and services GRAIL purchases, as well as the pricing grids used for those purchases. (RX3935 (Illumina) at 2.)

Response to Finding No. 1005.4

The proposed finding is misleading to the extent it implies that customers can "ensure that Illumina adheres" to the "Access to Supplied Products" term because the Open Offer "requires" Illumina to publish and update information about the products and services GRAIL

purchases, as well as the pricing grids. The provision in Respondents amended Open Offer terms they are referring to here is the "Grail Purchases and Services" term. This term provides that "Illumina shall publish, on the 'Oncology Contract Terms' website, (i) the Supplied Products, by SKU, that Grail is purchasing; (ii) the service plans, by SKU, that GRAIL is purchasing…." RX3935 at 002-003 (Illumina, Revised Open Offer Letter, Sept. 8, 2021)). It is unclear from this term whether the product SKU number will tell customer what products Grail is specifically receiving from Illumina. Thus, proposed finding is misleading to the extent it implies that customers can know from the "Oncology Contract Terms" website what products Grail receives from Illumina.

The term "requires" is misleading to the extent it implies that Illumina cannot breach the terms of the Open Offer. As [redacted] Guardant's Senior Vice President of Commercial, William Getty, testified that after the acquisition, Illumina's "incentive to work with us goes down almost to nothing because ultimately we will now be competing in

the same market, and therefore Illumina, as they should, will want to maintain a competitive advantage over Guardant in that space." (PX7105 (Getty (Guardant) Dep. at 68-69)).

This proposed finding is misleading to the extent it implies that Illumina's customers have leverage over Illumina's actions. Illumina customers testified to their minimal negotiating leverage with Illumina, as Illumina is their sole supplier of sequencing instruments, reagents, and service. For example, Singlera's Dr. Gao testified that Singlera has little to no negotiating leverage with Illumina. (PX7042 (Gao (Singlera) IHT at 84-85). Additionally, Dr. Gao testified that in negotiations with Illumina, "their [Illumina's] way is my way or the highway. If you gave [Illumina] that profit margin, well, [Illumina] -- you know, [Illumina] can allow you to survive. If not, you just die." (CCFF ¶ 2719).

The proposed finding is also misleading to the extent it implies that Illumina's breach of the Open Offer would harm Illumina's reputation. If customers are able to discover a potential

breach by Illumina of the Open Offer, the Open Offer explicitly provides that they must submit the matter to "confidential binding arbitration." (PX0064 at 008 (Illumina Open Offer Agreement, March 29, 2021)). Because enforcement of the Open Offer is confidential, other customers and industry participants would not learn of the breach. Thus, Illumina ensured, through its unilaterally imposed contractual terms, that its reputation cannot be harmed if it breaches the Open Offer. In addition, Illumina can breach the Open Offer in subtle ways that will likely go undetected. [redacted]

In addition, the weight of the evidence shows that Illumina's reputation among its customers is already poor. [redacted] Illumina's customers agree. For example, Ariosa's former CEO, Mr. Song testified that Illumina is "kind of the big bully" and "people are scared of them." (PX7071 (Song (Omniome) IHT at 43-44)). [redacted]

[redacted]

Additionally, Illumina does not care much about its reputation with MCED customers because MCED customers have nowhere else to go. [redacted] Singlera's Mr. Gao testified at trial that Illumina is the "800-pound" gorilla as "Illumina control[s] the supply chain for all the NGS-based early cancer detection technology, not only for Singlera, but for other companies." (Gao (Singlera) Tr. 2947-48; *see also* PX7042 (Gao (Singlera) IHT) at 88 (describing Singlera's relationship with Illumina as like being a "prisoner of war")).

Lastly, Illumina has already shown that it is willing to risk harm to its reputation to secure ownership of Grail and its future profits. Specifically, Illumina acknowledged that consummating the transaction during the pendency of the European Commission's review could lead to "other adverse consequences to, among other things, its reputation," but Illumina chose to do so anyway. (PX0378 at 005 (Illumina Form 8-K, Aug. 18, 2021); *see also* deSouza (Illumina) Tr. 2236-37 (stating that Illumina decided to close the transaction despite the potential risk to its reputation)). Therefore, this Court should disregard the proposed finding.

1005.5 The Open Offer specifically requires that "Illumina shall publish, on the "Oncology Contract Terms" website, (i) the Supplied Products, by SKU, that GRAIL is purchasing; (ii) the service plans, by SKU, that GRAIL is purchasing; and (iii) the pricing grid for both products and services under which GRAIL is purchasing Supplied Products

> and services. To the extent necessary, Illumina shall update this website within 5 days of entry of any purchase order for Supplied Products or any service contract relating to the Supplied Products by GRAIL." (RX3935 (Illumina) at 2; RX4003 (Illumina) at 1; RX3960 (Illumina).)

Response to Finding No. 1005.5

The proposed finding is misleading to the extent it implies that customers can know from the "Oncology Contract Terms" website what products and services Grail receives from Illumina The Open Offer's amended terms, which were presented in the middle of trial, state that "Illumina shall publish, on the 'Oncology Contract Terms' website, (i) the Supplied Products, by SKU, that Grail is purchasing; (ii) the service plans, by SKU, that GRAIL is purchasing…." RX3935 at 002-003 (Illumina, Revised Open Offer Letter, Sept. 8, 2021)). It is unclear from this term whether the product and service SKU number will tell customer what products and services Grail is specifically receiving from Illumina. Thus, proposed finding is misleading to the extent it implies that customers can know from the "Oncology Contract Terms" website what products Grail receives from Illumina. Even Illumina's executive and Open Offer signatory, Ms. Berry testified that under the Open Offer, a customer would not know in real-time what products its competitors are purchasing from Illumina. (PX7076 (Berry (Illumina) Dep. at 292)). Certain information, such as a customer's order information and service reports, is confidential and one customer would not have access to another customer's information). (PX7076 (Berry (Illumina) Dep. at 81; 291)). Ms. Berry testified that under the Open Offer, customers would not be able to know in real-time what prices its competitors are paying for Illumina products. (PX7076 (Berry (Illumina) Dep. at 291-92)).

The term "requires" is misleading to the extent it implies that Illumina cannot breach the terms of the Open Offer. As [redacted]

[redacted] Guardant's Senior Vice President of Commercial, William Getty, testified that after the acquisition, Illumina's "incentive to work with us goes down almost to nothing because ultimately we will now be competing in the same market, and therefore Illumina, as they should, will want to maintain a competitive advantage over Guardant in that space." (PX7105 (Getty (Guardant) Dep. at 68-69)).

This proposed finding is misleading to the extent it implies that Illumina's customers have leverage over Illumina's actions. Illumina customers testified to their minimal negotiating leverage with Illumina, as Illumina is their sole supplier of sequencing instruments, reagents, and service. For example, Singlera's Dr. Gao testified that Singlera has little to no negotiating leverage with Illumina. (PX7042 (Gao (Singlera) IHT at 84-85). [redacted]

[redacted] Therefore, this Court should disregard the proposed finding.

1006. In addition to requiring equivalent access to products for purchase, the Open Offer requires Illumina to provide customers, within 5 days, with the same information that GRAIL receives about final product specifications of any sequencing instruments or core consumables. (RX3935 (Illumina) at 2.)

Response to Finding No. 1006

The proposed finding is vague because it does not define or describe what "access" means and nowhere in the Open Offer is the term "access" defined. (*See* PX0064 (Illumina, Open Offer Letter, Mar. 29, 2021)). Additionally, "access" is not defined in Illumina's additional supply agreement terms which were presented in the middle of trial. (RX3935 at 001-002 (Illumina, Revised Open Offer Letter, Sept. 8, 2021)).

[redacted]

[redacted]

[redacted]

1006.1 Specifically, the Open Offer requires that "Customer shall have access to the same information about final product specifications of any new Supplied Product, any new version of a Supplied Product or any Pre-Release Sequencing Product within 5 days of when GRAIL is provided such information." (RX3935 (Illumina) at 2.)

Response to Finding No. 1006.1

The proposed finding is vague because it does not define or describe what "access"

means and nowhere in the Open Offer is the term "access" defined. (*See* PX0064 (Illumina, Open Offer Letter, Mar. 29, 2021)). Additionally, "access" is not defined in Illumina's additional supply agreement terms which were presented in the middle of trial. (RX3935 at 001-002 (Illumina, Revised Open Offer Letter, Sept. 8, 2021)).

Complaint Counsel acknowledges that Respondents' Open Offer letter includes the quoted language. However, the term "requires" is misleading to the extent it implies that Illumina cannot breach the terms of the Open Offer. As [redacted]

1007. The Open Offer also provides customers the same access to purchase sequencing instruments and core consumables to which any For-Profit Entity has access. (Rabinowitz (Natera) Tr. 421; Berry (Illumina) Tr. 878–79; deSouza (Illumina) Tr. 2434–35, 2437–38; PX0064 (Illumina) at 6; RX3935 (Illumina) at 2.)

Response to Finding No. 1007

The proposed finding is vague because it does not define or describe what "access" means and nowhere in the Open Offer is the term "access" defined. (*See* PX0064 (Illumina, Open Offer Letter, Mar. 29, 2021)). Additionally, "access" is not defined in Illumina's additional supply agreement terms which were presented in the middle of trial. (RX3935 at 001-002 (Illumina, Revised Open Offer Letter, Sept. 8, 2021)).

[redacted]

1007.1 The Open Offer requires that "Customer shall have access to the Supplied Products for purchase that . . . any For-Profit Entity has access, within 5 days of when . . . such For-Profit Entity . . . is offered such access (if not earlier) for purchase." (RX3935 (Illumina) at 2.)

Response to Finding No. 1007.1

Complaint Counsel acknowledges that Respondents' Additional Supply Agreement Terms to the Open Offer, which was presented for the first time in the middle of trial, includes the quoted language. The proposed finding is vague because it does not define or describe what "access" means and nowhere in the Open Offer is the term "access" defined. (*See* PX0064 (Illumina, Open Offer Letter, Mar. 29, 2021)). Additionally, "access" is not defined in Illumina's additional supply agreement terms which were presented in the middle of trial. (RX3935 at 001-

002 (Illumina, Revised Open Offer Letter, Sept. 8, 2021))

[redacted]

The proposed finding relies solely upon the self-serving evidence of Illumina's own supply agreement terms and does not cite to any customer with actual experience in the industry and actually subject to the Open Offer's terms to support Respondents' proposed "fact." Therefore, this Court should disregard the proposed finding.

[redacted]

[redacted]

1007.2 For example, if Illumina made improvements to a sequencing instrument (such as to its speed, throughput, or cost), there is no way for Illumina to limit these improvements to one particular user or customer. (deSouza (Illumina) Tr. 2446–47.)

Response to Finding No. 1007.2

The proposed finding is misleading to the extent it implies Illumina cannot give Grail early access to new products or inform Grail of its product pipeline. [redacted]

[redacted]

The proposed finding relies solely upon the self-serving testimony of Illumina's CEO, Francis deSouza, and does not cite to any customer with actual experience in the industry and actually subject to the Open Offer's terms to support Respondents' proposed "fact." Therefore, this Court should disregard the proposed finding.

> 1007.3 Illumina can ensure that it complies with this provision because when Illumina launches a product, the product is made available to all customers at once. (Berry (Illumina) Tr. 877.) In other words, there is no selective restriction that Illumina can apply to a product in a full commercial launch. (Berry (Illumina) Tr. 877.)

Response to Finding No. 1007.3

This proposed finding is speculative and misleading. This proposed finding is inherently speculative. For support, Respondents cite only to the unfounded, self-serving testimony of Illumina VP and General Manager, Americas, Nicole Berry, that is uncorroborated by any ordinary course documents or customer testimony. Given the inherent unreliability of this testimony as well as lack of foundation or explanation for Ms. Berry's base conjecture, this proposed finding of fact should be disregarded.

The proposed finding is misleading to the extent it equates a product launch with actual availability of the product to certain customers at a certain time, and to the extent it implies that a "selective restriction" is the only way that Illumina could evade the provision in question. Further, the phrase "selective restriction" is vague and undefined.

The proposed finding is misleading to the extent it implies that Illumina customers will

know what other customers are purchasing. Even Illumina's executive and Open Offer signatory, Ms. Berry testified that under the Open Offer, a customer would not know in real-time what products its competitors are purchasing from Illumina. (PX7076 (Berry (Illumina) Dep. at 292)). Certain information, such as a customer's order information and service reports, is confidential and one customer would not have access to another customer's information). (PX7076 (Berry (Illumina) Dep. at 81; 291)). Ms. Berry testified that under the Open Offer, customers would not be able to know in real-time what prices its competitors are paying for Illumina products. (PX7076 (Berry (Illumina) Dep. at 291-92)).

The proposed finding is also misleading because it omits Ms. Berry's testimony—on the very same page of the trial transcript—stating that Illumina *does* give some customers access to certain products prior to launch. (Berry (Illumina) Tr. 877 ("for certain products we . . . [make] these pre-release sequencing products accessible to limited numbers of customers prior to launch for the purposes primarily of that customer providing us with feedback.")). Therefore, this Court should disregard the proposed finding.

> 1007.4 Also, the Open Offer contains a table showing the specific orderable SKUs that comprise the Supplied Products under the Open Offer. (Berry (Illumina) Tr. 878; PX0064 (Illumina) at 15–27.) If Illumina launched a new product, it would update this table accordingly. (Berry (Illumina) Tr. 878.)

Response to Finding No. 1007.4

This proposed finding is vague, unsupported, and misleading to the extent it implies that all customers will have access to the same information at the same time, but neither the proposed finding nor the cited sources support that or provide any timing for updating the table, nor do the cited sources indicate any requirement for providing the updated table to all customers on the same timeframe. Additionally, it is unclear whether a new product SKU number will tell customer whether Illumina has launched a new product.

This proposed finding is also inherently speculative. To support the statement that the table will be updated, Respondents cite only to the unfounded, self-serving testimony of Illumina VP and General Manager, Americas, Nicole Berry, uncorroborated by any ordinary course documents or analysis. Given the inherent unreliability of this testimony as well as lack of foundation or explanation for Ms. Berry's base conjecture, this proposed finding of fact should be disregarded.

The proposed finding is also misleading because it omits Ms. Berry's testimony stating that Illumina *does* give some customers access to certain products prior to launch. (Berry (Illumina) Tr. 877 ("for certain products we . . . [make] these pre-release sequencing products accessible to limited numbers of customers prior to launch for the purposes primarily of that customer providing us with feedback.")). Therefore, this Court should disregard the proposed finding.

1008. Customers who sign the Open Offer must also receive equitable access to purchase any Pre-Release Sequencing Products. (Rabinowitz (Natera) Tr. 421; Berry (Illumina) Tr. 702; PX0064 (Illumina) at 6; RX3935 (Illumina) at 2.)

Response to Finding No. 1008

The proposed finding is vague because it fails to define or describe what "equitable access" means. The proposed finding is vague because it does not define or describe what "access" means and nowhere in the Open Offer is the term "access" defined. (*See* PX0064 (Illumina, Open Offer Letter, Mar. 29, 2021)). Additionally, "access" is not defined in Illumina's additional supply agreement terms which were presented in the middle of trial. (RX3935 at 001-002 (Illumina, Revised Open Offer Letter, Sept. 8, 2021)).

[redacted]

[redacted]

1008.1 The Open Offer requires that "Customer shall have access for purchase to any Pre-Release Sequencing Product to which GRAIL or any For-Profit Entity is offered access within 5 days of when GRAIL or such For-Profit Entity, as applicable, is offered

such access (if not earlier), and for the same categories of uses . . . ." (PX0064 (Illumina) at 6; RX3935 (Illumina) at 2.)

Response to Finding No. 1008.1

The proposed finding is vague because it does not define or describe what "access" means and nowhere in the Open Offer is the term "access" defined. (*See* PX0064 (Illumina, Open Offer Letter, Mar. 29, 2021)). Additionally, "access" is not defined in Illumina's additional supply agreement terms which were presented in the middle of trial. (RX3935 at 001-002 (Illumina, Revised Open Offer Letter, Sept. 8, 2021)). The proposed finding is vague because it fails to define or describe what "for the same categories of uses" means.

[redacted]

[redacted]

[redacted]

1008.2 Pre-Release Sequencing Product "means Illumina sequencing hardware or Sequencing Consumables that are not available for purchase in Illumina's product catalogue. Such sequencing hardware or Sequencing Consumables shall include any re-designed or modified products made available to any For- Profit Entity or to GRAIL that optimize, in any material respect, a product's interoperability, capabilities, or performance." (PX0064 (Illumina) at 4.)

Response to Finding No. 1008.2

Complaint Counsel acknowledges that Illumina's Open Offer dated March 29, 2021 includes this definition.

1008.3 The pre-release access provision was intended to assure customers that there would be no advantage conferred on GRAIL or another commercial player in the oncology testing space. (Berry (Illumina) Tr. 880.)

Response to Finding No. 1008.3

This proposed finding is vague because the term "advantage" is undefined.

The proposed finding is vague because it does not define or describe what "access" means and nowhere in the Open Offer is the term "access" defined. (*See* PX0064 (Illumina, Open Offer Letter, Mar. 29, 2021)). Additionally, "access" is not defined in Illumina's additional supply agreement terms which were presented in the middle of trial. (RX3935 at 001-002 (Illumina, Revised Open Offer Letter, Sept. 8, 2021)).

This proposed finding is also inherently speculative. For support, Respondents cite only to the unfounded, self-serving testimony of Illumina VP and General Manager, Americas, Nicole Berry. Given the inherent unreliability of this testimony as well as lack of foundation or explanation for Ms. Berry's base conjecture, this proposed finding of fact should be disregarded.

To the extent the cited testimony references a provision of the Open Offer, as [redacted]

[redacted]

[redacted]

1008.4 Because providing Pre-Release Sequencing Products to customers is quite unusual, it will be very manageable for Illumina to ensure that it complies with this provision. (Berry (Illumina) Tr. 880.)

Response to Finding No. 1008.4

This proposed finding is vague, speculative, and misleading. It is vague because "quite unusual" is unclear and undefined.

This proposed finding is also inherently speculative. For support, Respondents cite only to the unfounded, self-serving testimony of Illumina VP and General Manager, Americas, Nicole Berry. Given the inherent unreliability of this testimony as well as lack of foundation or explanation for Ms. Berry's base conjecture, this proposed finding of fact should be disregarded.

The proposed finding is misleading to the extent it implies that Illumina has not provided "pre-released sequencing products to customers" in the past. The Open Offer provides a pre-release sequencing product "means Illumina sequencing hardware or Sequencing Consumables that are not available for purchase in Illumina's product catalogue." (PX0064 at 004 (Illumina,

Open Offer Letter, Mar. 29, 2021)).

The proposed finding is misleading to the extent it implies that Illumina has not provided "pre-released sequencing products to customers" in the past. The Open Offer provides a pre-release sequencing product "means Illumina sequencing hardware or Sequencing Consumables that are not available for purchase in Illumina's product catalogue." (PX0064 at 004 (Illumina, Open Offer Letter, Mar. 29, 2021)).

[redacted]

To the extent the cited testimony references a provision of the Open Offer, as [redacted]

1008.5 Illumina will provide access to Pre-Release Sequencing Products as quickly as practically possible. (Berry (Illumina) Tr. 703–06.)

Response to Finding No. 1008.5

This proposed finding is vague, speculative, and misleading. The phrase "as quickly as practicable" is vague and undefined. The proposed finding is vague because it does not define or describe what "access" means and nowhere in the Open Offer is the term "access" defined. (*See* PX0064 (Illumina, Open Offer Letter, Mar. 29, 2021)). Additionally, "access" is not defined in Illumina's additional supply agreement terms which were presented in the middle of trial. (RX3935 at 001-002 (Illumina, Revised Open Offer Letter, Sept. 8, 2021))

The proposed finding is misleading to the extent it implies that the Open Offer's terms state that "Illumina will provide access to Pre-Release Sequencing Products as quickly as practically possible." Nowhere in the Open Offer or its amended terms, which were presented in the middle of trial, does Illumina make this commitment. (*See* PX0064 (Illumina, Open Offer Letter, Mar. 29, 2021); RX3935 at (Illumina, Revised Open Offer Letter, Sept. 8, 2021)). This proposed finding is also inherently speculative. Respondents imply that Illumina will treat all customers equally but cite only to the unfounded, self-serving testimony of Illumina VP and General Manager, Americas, Nicole Berry. Given the inherent unreliability of this testimony as well as lack of foundation or explanation for Ms. Berry's base conjecture, this proposed finding of fact should be disregarded.

The proposed finding is also misleading to the extent it implies that Illumina will do what is best for all its customers. The weight of the evidence shows that Illumina's reputation among its customers is poor. [redacted]

[redacted]

Additionally, Illumina does not care much about its reputation with MCED customers because MCED customers have nowhere else to go. [redacted] Singlera's Mr. Gao testified at trial that Illumina is the "800-pound" gorilla as "Illumina control[s] the supply chain for all the NGS-based early cancer detection technology, not only for Singlera, but for other companies." (Gao (Singlera) Tr. 2947-48; *see also* PX7042 (Gao (Singlera) IHT) at 88 (describing Singlera's relationship with Illumina as like being a "prisoner of war")). Therefore, this Court should disregard the proposed finding.

1008.6 Considering the length of time that it takes to develop a test on a sequencing platform, 5 days is "a very inconsequential amount of time" for a developer making a test. (*see* Aravanis (Illumina) Tr. 1930; *see also* Berry (Illumina) Tr. 702–03; [redacted] PX7100 (Chudova (Guardant) Dep. at 75–79); [redacted]

Response to Finding No. 1008.6

The proposed finding is misleading and incorrect to the extent it implies that customer have stated that 5 days is an inconsequential amount of time. Illumina's "5-day" time frame was not introduced until September 2021, during the middle of trial, when the customer testimony Respondents cite to here occurred well before September 2021. Respondents do not cite any MCED customer testimony from September 2021.

Respondents incorrectly cite to Illumina's Mr. Aravanis's testimony. Mr. Aravanis testified to Illumina's 45-day notice time frame, not the 5-day notice time frame. (*See* Aravanis (Illumina) Tr. 1930). Mr. Aravanis testified "these tests are developed over many years. Forty-five days is a very inconsequential amount of time relative to the years it takes to develop one of these products." (Aravanis (Illumina) Tr. 1930). Similarly, Respondents incorrectly cite to Illumina's Ms. Berry's testimony. Ms. Berry testified to Illumina's 45-day notice time frame, not the 5-day notice time frame. (*See* Berry (Illumina) Tr. 702-03).

[redacted]

[redacted]

1009. These provisions requiring equitable access to Supplied Products and Pre-Release Sequencing Products very directly address the foreclosure concerns that have been raised. (RX6002 (Guerin-Calvert Trial Dep. at 59–60).)

Response to Finding No. 1009

The proposed finding is vague because it fails to define or describe what "equitable access" means. The proposed finding is vague because it does not define or describe what "access" means and nowhere in the Open Offer is the term "access" defined. (*See* PX0064 (Illumina, Open Offer Letter, Mar. 29, 2021)). Additionally, "access" is not defined in Illumina's additional supply agreement terms which were presented in the middle of trial. (RX3935 at 001-002 (Illumina, Revised Open Offer Letter, Sept. 8, 2021)).

[redacted]

[redacted]

1009.1 The provisions directly address the concern that products could be withheld so as to disadvantage GRAIL rivals because they require providing equivalent access within a very short time frame. (RX6002 (Guerin-Calvert Trial Dep. at 60).)

Response to Finding No. 1009.1

The proposed finding is vague because it fails to define or describe what "equivalent access" and "very short time frame" mean. The proposed finding is vague because it does not define or describe what "access" means and nowhere in the Open Offer is the term "access" defined. (*See* PX0064 (Illumina, Open Offer Letter, Mar. 29, 2021)). Additionally, "access" is not defined in Illumina's additional supply agreement terms which were presented in the middle of trial. (RX3935 at 001-002 (Illumina, Revised Open Offer Letter, Sept. 8, 2021)).

[redacted]

1009.2 The provisions directly guarantee that MCED test developers will have notice of technical enhancements and technical upgrades because they require upgraded technologies to be made available to customers on a timely basis. (RX6002 (Guerin-Calvert Trial Dep. at 60–61).)

Response to Finding No. 1009.2

The proposed finding is vague because it fails to define or describe what "directly guarantee," "technical enhancements," "technical upgrades," and "timely basis" mean. The proposed finding is vague because it fails to define or describe how Illumina's Open Offer provisions "directly guarantee that MCED test developers will have notice of technical enhancements…"

[redacted]

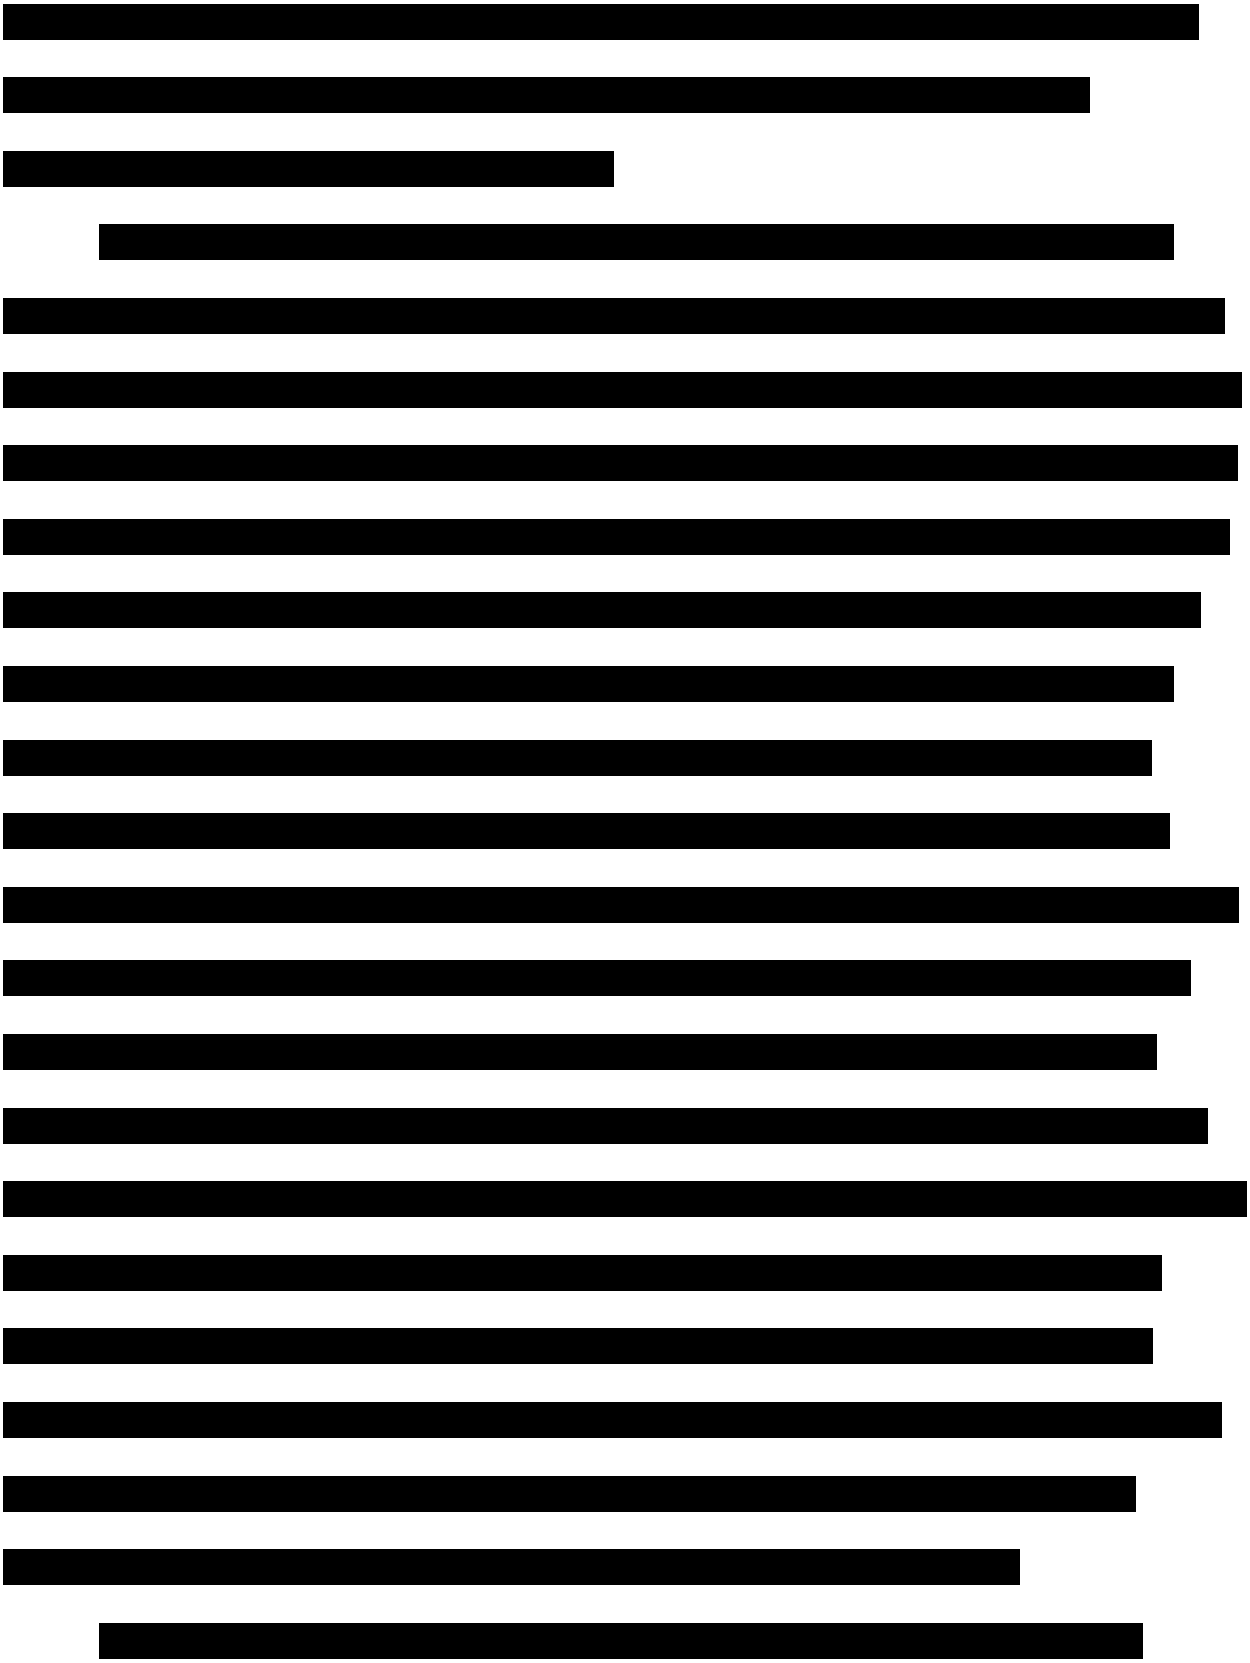
[redacted]

1009.3 The provisions guarantee that MCED test developers will have a consistent quality of supply because, as newer products of higher quality are released, they must be made available to customers. (RX6002 (Guerin-Calvert Trial Dep. at 61).)

Response to Finding No. 1009.3

The proposed finding is vague because it fails to define or describe what the phrases "consistent quality of supply" and "newer products of higher quality" mean. The proposed finding is vague because it fails to define or describe how Illumina's Open Offer provisions "very directly address the foreclosure concerns." [redacted]

[redacted]



[redacted]

1009.4 The provisions specifically address the concern that Illumina could disadvantage GRAIL rivals by delaying access to products because they level the playing field for customers and prevent individual customers from lagging behind in terms of what products are available to them. (RX6002 (Guerin-Calvert Trial Dep. at 61–62).)

Response to Finding No. 1009.4

The proposed finding is vague because it does not explain or describe how the Open Offer provides a "level the playing field for customers," "delaying access," or "prevent[s] individual customers from lagging behind in terms of" products available. The proposed finding is vague because it does not define or describe what "access" means and nowhere in the Open Offer is the term "access" defined. (*See* PX0064 (Illumina, Open Offer Letter, Mar. 29, 2021)). Additionally, "access" is not defined in Illumina's additional supply agreement terms which were presented in the middle of trial. (RX3935 at 001-002 (Illumina, Revised Open Offer Letter, Sept. 8, 2021)). [redacted]

[redacted]

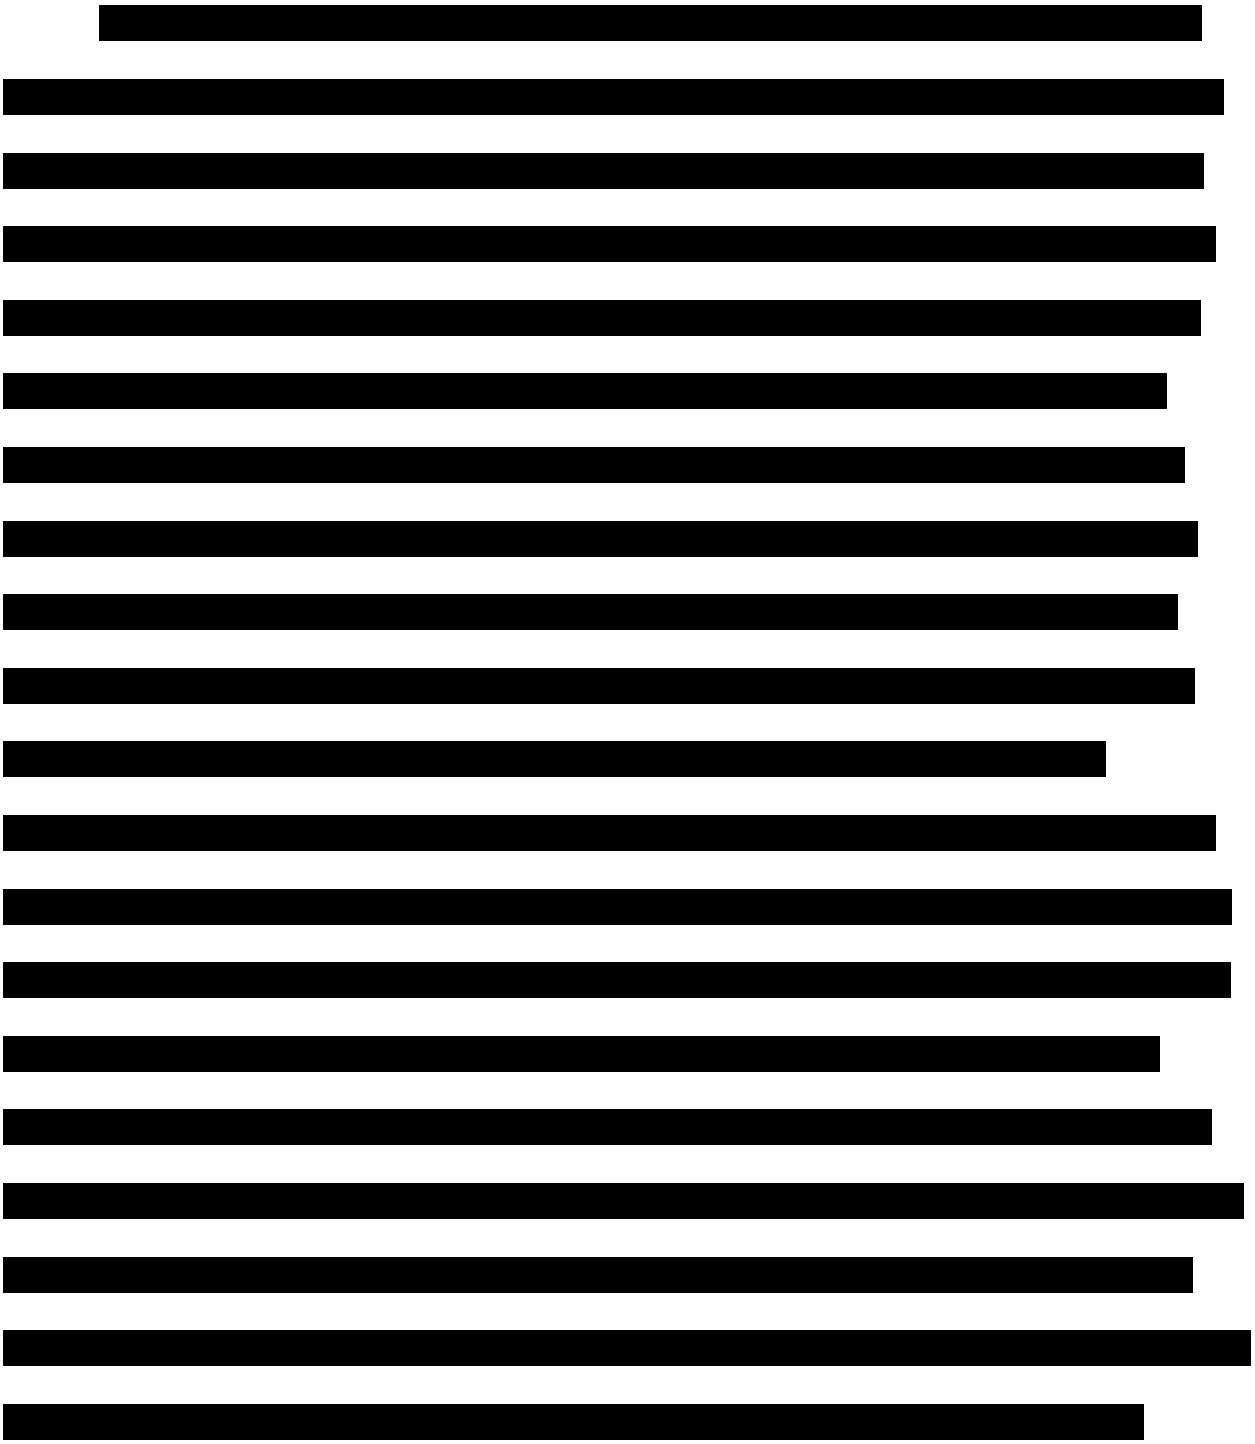
[redacted]

1010. In addition to the provisions requiring equivalent access to products, the Open Offer requires Illumina to enter into development agreements, on customers' requests, to design or modify Illumina's products to optimize interoperability with customers' tests. (Berry (Illumina) Tr. 881; PX0064 (Illumina) at 6.)

Response to Finding No. 1010

The proposed finding is vague because it fails to define or describe what the phrases "development agreements" or "optimize interoperability" mean. Additionally, the proposed finding relies solely upon the self-serving testimony of Illumina's Senior Vice President and General Manager of Americans, and the Open Offer Signatory, Nicole Berry. Respondents do

not cite to any customers that are actually subject to the terms of the Open Offer. Instead, the evidence shows that the actual customers subject to the terms of the Open Offer testified that they do not think the development agreement provision addresses their concerns.



[redacted]

[redacted]

1010.1 The Open Offer requires that "Illumina shall enter into, upon Customer request, a separate development agreement with Customer on commercially reasonable terms, relating to the design or modification of any Supplied Product, in a manner that optimizes interoperability with Customer's tests, including, without limitation, capabilities, performance, speed, efficiency, cost, convenience, accuracy, specificity, precision, ease of use and user experience." (PX0064 (Illumina) at 6.)

Response to Finding No. 1010.1

[redacted]

[redacted]

1010.2 The development agreement term was added based on a specific request from FMI to incorporate this type of clause into an agreement. (Berry (Illumina) Tr. 881.)

Response to Finding No. 1010.2

The proposed finding is vague because it fails to define or describe the "specific request" it is referring to. Additionally, the proposed finding relies solely upon the self-serving testimony of Illumina's Senior Vice President and General Manager of Americans, and the Open Offer Signatory, Nicole Berry. Respondents do not cite to any testimony from FMI executives to support its "fact."

[redacted]

[redacted]

1010.3 Illumina typically has not entered into such separate development agreements with any customers. (Berry (Illumina) Tr. 844, 882.) [redacted]

Response to Finding No. 1010.3

[redacted]

[redacted]

[redacted]

1010.4 Customers typically develop their tests without Illumina's developmental assistance or any optimization support with respect to their sequencing instruments or consumables. (Berry (Illumina) Tr. 844–47; *see, e.g.*, [redacted]

Response to Finding No. 1010.4

[redacted]

[redacted]

[redacted]

1010.5 Customers do not typically come to Illumina for advice on the development of their assays. (Berry (Illumina) Tr. 844.)

Response to Finding No. 1010.5

This proposed finding is vague and misleading. The terms typically and advice are vague in this context and are not defined. The proposed finding is also misleading to the extent it purports to speak to customer behavior but cites only the self-serving testimony of an Illumina executive.

The proposed finding is misleading to the extent it implies that Illumina customers do not need or want Illumina's assistance to develop their tests. MCED customers need Illumina's assistance throughout the developmental process of their test. [redacted]

[redacted]

1010.6 Illumina typically does not provide support in the development or commercialization of its customers' products. (Berry (Illumina) Tr. 846–47.)

Response to Finding No. 1010.6

This proposed finding is vague and misleading. It is vague because the terms "typically" and "support" are unclear and undefined. The proposed finding is also misleading because it ignores Ms. Berry's testimony that Illumina supports customers with troubleshooting and with

"the parts of the workflow that [Illumina] provide[s]." (Berry (Illumina) Tr. 846).

The proposed finding is misleading to the extent it implies that Illumina customers do not need or want Illumina's assistance to develop their tests. MCED customers need Illumina's assistance throughout the developmental process of their test. [redacted]

Additionally, [redacted]

[redacted]

1010.7 Customers typically purchase Illumina equipment and reagents "off the shelf" and do not commission Illumina to make custom sequencing equipment. (Berry (Illumina) Tr. 845; [redacted]

Response to Finding No. 1010.7

[redacted]

[redacted]

1010.7.1 Customers *prefer* to develop their tests on their own because they do not want to share key algorithms or analyses used to analyze the genetic data—*i.e.*, the "secret sauce"—with Illumina. (*See* Berry, Tr. 679.)

Response to Finding No. 1010.7.1

The proposed finding is vague because it fails to define or describe what "key algorithms or analyses" and the "secret sauce" include.

The proposed finding relies solely upon the self-serving testimony of Illumina's Senior Vice President and General Manager of Americas, and the Open Offer signatory, Nicole Berry. Respondents do not cite to any customers for the statement of what "customers prefer."

[redacted]

1010.7.2 [redacted]

[redacted]

Response to Finding No. 1010.7.2

[redacted]

[redacted]

[redacted]

1010.8 Although Illumina does not typically enter into separate development agreements, the development agreement provision was added to the Open Offer to accommodate, in a customer-friendly way, the possible categories of requests that Illumina might be likely to receive over a 12–year period. (Berry (Illumina) Tr. 882.)

Response to Finding No. 1010.8

The proposed finding is vague because it fails to define or describe what the phrases "typically enter," "separate development agreements," or "customer-friendly way" mean. Nowhere in Illumina's Open Offer is the term "customer-friendly way" defined or used. (*See* PX0064 (Illumina, Open Offer Letter, Mar. 29, 2021)). The proposed finding is vague because it fails to define or describe what "possible categories of requests" Illumina be receive over a 12-year period.

The proposed finding relies solely upon the self-serving testimony of Illumina's Senior Vice President and General Manager of Americas, and the Open Offer signatory, Nicole Berry. Respondents do not cite to any customer testimony or internal documents to support the "fact" that Illumina does not typically enter into separate development agreements." Also, Respondents do not cite to any customer testimony or internal documents to support the "fact" that the Open

Offer's development agreement provision was added to accommodate, in a customer-friendly way, the categories of requests that Illumina might receive over a 12-year period.

[redacted]

[redacted]

1010.9 The development agreement term works with the term on access to Pre-Release Sequencing Products to prevent Illumina from materially advantaging GRAIL or materially disadvantaging GRAIL's rivals because customers will be notified of any Pre-Release Sequencing Products and can pursue a development agreement to optimize interoperability of their tests with those products. (RX6002 (Guerin-Calvert Trial Dep. at 70–71).)

Response to Finding No. 1010.9

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (*See* Order on Post-Trial Findings at 3). Here Respondents cite Guerin-Calvert as the only source of evidence supporting the proposed finding in contravention of this Court's Order. Further, it constitutes improper legal conclusion by an expert witness. The Court should disregard this evidence.

The proposed finding should further be disregarded because it is not a "finding of fact," but rather a legal conclusion in contravention of this Court's order and the Part 3 rules. (*See* 16 C.F.R. § 3.46; Order on Post-Trial Findings). This proposed finding is also misleading because the term "materially advantaging" is unclear and undefined.

The proposed finding is misleading to the extent it implies that the Open Offer's development plan and access to pre-released sequencing products prevent Illumina from disadvantaging Grail's rivals because customers will be notified of any Pre-Release Sequencing Products and can pursue a development agreement to optimize interoperability of their tests with those products. It is unclear whether a customer will know when a pre-released sequencing product is provided to a customers. [redacted] Even Illumina's executive and Open Offer signatory, Ms. Berry testified that Illumina's customers would not know whether they have access to prerelease products at the same time as Grail "unless Illumina proactively communicated such." (Berry (Illumina) Tr. 701). Therefore, this

Court should disregard the proposed finding.

1010.10 The development agreement term not only prevents Illumina from disadvantaging GRAIL rivals, but also requires Illumina to act in a particular way to support rivals developing their own competitive products. (RX6002 (Guerin-Calvert Trial Dep. at 68).)

Response to Finding No. 1010.10

The proposed finding is vague because it fails to define or describe what "disadvantaging GRAIL rivals, "act in a particular way," or "support rivals developing their own competitive products" means. The proposed finding relies solely upon the self-serving testimony of Respondents' paid expert, Ms. Guerin-Calvert, and does not cite to any customer testimony stating that the Open Offer's development agreement "prevents Illumina from disadvantaging GRAIL rivals" and "requires Illumina to act in a particular way to support rivals developing their own competitive products. Instead, the evidence shows that the actual customers subject to the terms of the Open Offer testified that they have concerns about the Open Offer's development agreement provision. [redacted]

[redacted]

[redacted]

1011. The Open Offer forbids Illumina (under the "no-obsolescence term") from discontinuing products that any oncology customer has purchased in the prior year. (Rabinowitz (Natera) Tr. 421–22; Berry (Illumina) Tr. 883; PX0064 (Illumina) at 6; [redacted]

Response to Finding No. 1011

[redacted]

[redacted]

[redacted]

1011.1 The Open Offer requires that "Illumina shall not discontinue any Supplied Product so long as Customer continues to purchase that Supplied Product. Illumina may discontinue a Supplied Product that Customer has not purchased in more than one year." (PX0064 (Illumina) at 6.)

Response to Finding No. 1011.1

Complaint Counsel acknowledges that Respondents' Open Offer letter includes the quoted language. However, the term "requires" is misleading to the extent it implies that Illumina cannot breach the terms of the Open Offer. As [redacted]

> 1011.2 Illumina will ensure compliance with this provision through comprehensive recordkeeping, which makes it easy for Illumina to know which products customers are buying. (Berry (Illumina) Tr. 885.)

Response to Finding No. 1011.2

This proposed finding is inherently speculative. For support, Respondents cite only to the unfounded, self-serving testimony of an Illumina executive that is uncorroborated by any ordinary course documents or analysis. Given the inherent unreliability of this testimony as well as lack of foundation or explanation for the executive's base conjecture, this proposed finding of fact should be disregarded. This proposed finding is also vague because it is unclear what

Respondents mean by "comprehensive records" and that phrase is not defined.

The term "ensure" is misleading to the extent it implies that Illumina cannot breach the terms of the Open Offer. As [redacted]

1011.3 Before the Open Offer, there were no prohibitions on Illumina discontinuing any of its sequencing products. (Berry (Illumina) Tr. 883–84.)

Response to Finding No. 1011.3

This proposed finding is misleading to the extent it implies that prior to the Open Offer, there were no terms governing the discontinuation of a product. Ms. Berry testified that even before the Open Offer, Illumina had "some specific notification periods for products we were planning to obsolesce." (Berry (Illumina) Tr. 883).

The proposed finding is misleading to the extent it implies that the Open Offer is sufficient because it provides customers with terms they have not had in the past. Prior to the

Acquisition, Illumina contracted with customers at arms-length. Post-Acquisition, Illumina is now interacting with customers as rivals and the incentives behind how Illumina treats customer have changed. [redacted]

1011.4 The no-obsolescence term was introduced into the Open Offer to ensure that customers did not feel they were being forced to transition to a new product, even if that new product was better and cheaper. (Berry (Illumina) Tr. 884–85.) The term commits Illumina to supporting older platforms even if Illumina develops newer platforms. [redacted]

Response to Finding No. 1011.4

[redacted]

[redacted]

[redacted]

[redacted]

1011.5 The addition of the no-obsolescence term represents a significant change and improvement from the premerger status quo. (RX6002 (Guerin-Calvert Trial Dep. at 71–73).)

Response to Finding No. 1011.5

The proposed finding is misleading to the extent it implies that the Open Offer is sufficient because it provides customers with terms they have not had in the past. Prior to the Acquisition, Illumina contracted with customers at arms-length. Post-Acquisition, Illumina is now interacting with customers as rivals and the incentives behind how Illumina treats customer have changed. [redacted]

1011.6 Dr. Sean George, the Chief Executive Officer of Invitae, testified that Illumina's commitment to provide long-term continued access to Illumina products is reassuring for customers. (PX7081 (George (Invitae) Dep. at 59).) [redacted]

[redacted]

Response to Finding No. 1011.6

[redacted]

[redacted]

[redacted]

1011.7 The no-obsolescence provision of the Open Offer adequately addresses the concern often raised by economists in vertical transactions that an upstream firm could advantage its affiliate by simply no longer providing a product. (RX6002 (Guerin-Calvert Trial Dep. at 71–72).)

Response to Finding No. 1011.7

The proposed finding is vague because it fails to define or describe what "adequately addresses" means. Additionally, this proposed finding is vague because it fails to define or explain which "economists" it is referring to.

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (*See* Order on Post-Trial Findings at 3). Here Respondents cite Guerin-Calvert as the only source of evidence supporting the proposed finding in contravention of this Court's Order. Further, it constitutes improper legal conclusion by an expert witness. The Court should disregard this evidence.

The proposed finding should further be disregarded because it is not a "finding of fact," but rather a legal conclusion in contravention of this Court's order and the Part 3 rules. (*See* 16 C.F.R. § 3.46; Order on Post-Trial Findings).

The proposed finding is also inherently speculative and misleading. It purports to speak to the concerns of all economists while relying solely on the testimony of Respondents' paid expert. Given the inherent unreliability of this testimony as well as lack of foundation or explanation for the witness's base conjecture, this proposed finding of fact should be disregarded.

1011.8 The no-obsolescence term interacts with the pricing terms of the Open Offer by ensuring that customers are "certainly no worse off than in the current world" and are actually better off because they are assured continued availability of products and no price increases. (RX6002 (Guerin-Calvert Trial Dep. at 72–73).)

Response to Finding No. 1011.8

The proposed finding relies solely upon the self-serving testimony of Respondents' paid expert, Ms. Guerin-Calvert, and does not cite to any customers which have raised concerns over the no-obsolescence provision.

[redacted]

[redacted]

[redacted]

1012. Under the Open Offer, if Illumina experiences a supply shortage, it must allocate the existing supply in an equitable manner among its customers, including GRAIL and other affiliates. (Berry (Illumina) Tr. 885–86; PX0064 (Illumina) at 9.)

Response to Finding No. 1012

The proposed finding is vague because it fails to define or describe what "supply shortage" mean and what would qualify as a "supply shortage" Nor does the Open Offer or Respondents' amended Open Offer terms, presented in the middle of trial, define what constitutes a "supply shortage." (*See* PX0064 (Illumina, Open Offer Letter, Mar. 29, 2021); *see also* RX3935 at 001-002 (Illumina, Revised Open Offer Letter, Sept. 8, 2021)).

The proposed finding is vague because it fails to define or describe what an "equitable manner" means.

The proposed finding relies solely upon the self-serving testimony of Illumina's Senior Vice President and General Manager of Americas, and the Open Offer signatory, Nicole Berry. Respondents do not cite to any customers that are actually subject to the Open Offer. MCED customers are concerned about supply shortage. [redacted]

[redacted]

1012.1 The Open Offer requires that "[i]n the event Illumina is experiencing a supply shortage of the applicable Supplied Product (or components therein), Illumina will allocate the existing supply in an equitable manner among its customers (including Affiliates) based on expiring lots, and which shall not favor Affiliates over other customers." (PX0064 (Illumina) at 9.)

Response to Finding No. 1012.1

The proposed finding is vague because "equitable manner" is undefined in this "fact" and in the Open Offer and its amended terms which were presented in the middle of trial. (*See* PX0064 (Illumina, Open Offer Letter, Mar. 29, 2021); *see also* RX3935 at 001-002 (Illumina, Revised Open Offer Letter, Sept. 8, 2021)). Additionally, the proposed finding is vague because "expiring lots" is undefined in this "fact" and in the Open Offer and its amended terms. (*See* PX0064 (Illumina, Open Offer Letter, Mar. 29, 2021); *see also* RX3935 at 001-002 (Illumina, Revised Open Offer Letter, Sept. 8, 2021)).

Complaint Counsel acknowledges that Respondents' Open Offer letter includes the quoted language. [redacted]

[redacted]

1012.2 Illumina can ensure compliance with this provision because it tracks its supply when there is a supply shortage. (Berry (Illumina) Tr. 886–87.)

Response to Finding No. 1012.2

This proposed finding is inherently speculative, confusing, unsupported, and misleading. This proposed finding is inherently speculative because it relies solely on the unfounded, self-serving testimony of an Illumina executive that is uncorroborated by any ordinary course documents or analysis. It is further confusing, unsupported, and misleading to the extent it

implies that tracking supply shortages will ensure that Illumina complies with a contract term regarding how that supply is distributed. Given the inherent unreliability of this testimony as well as lack of foundation or explanation for the executive's base conjecture, this proposed finding of fact should be disregarded.

The proposed finding is vague because it fails to define or describe what a "supply shortage" means. The proposed finding relies solely upon the self-serving testimony of Illumina's Senior Vice President and General Manager of Americas, and the Open Offer signatory, Nicole Berry. Respondents do not cite to any customers that are actually subject to the Open Offer. MCED customers are concerned about supply shortage. [redacted]

The proposed finding is misleading to the extent it implies that Illumina knows how it will "allocate the existing supply in an equitable manner among its customers" if a supply shortage were to occur. Respondents' own expert Ms. Guerin-Calvert testified that she had not seen any documents or testimony that spells out how Illumina intends to allocate short supply among its customers. (RX6002 (Guerin-Calvert Trial Dep. at 154-55)).

Ultimately, even with the Open Offer's supply shortages provision, [redacted]

The term "ensure" is misleading to the extent it implies that Illumina cannot breach the terms of the Open Offer. As [redacted]

To the extent this finding purports to interpret a contract term, it should be disregarded because it is not a "finding of fact," but rather a legal conclusion in contravention of this Court's order and the Part 3 rules. (*See* 16 C.F.R. § 3.46; Order on Post-Trial Findings).

> 1012.3 Under the Open Offer, Illumina cannot disadvantage a customer in the event of a short supply relative to GRAIL. (Berry (Illumina) Tr. 886.)

Response to Finding No. 1012.3

This proposed finding is vague, inherently speculative, and misleading. This proposed finding is inherently speculative because it relies solely on the unfounded, self-serving testimony of an Illumina executive that is uncorroborated by any ordinary course documents or customer testimony. The proposed finding is vague because it is unclear what is meant by

"disadvantage[ing]" a customer.

The proposed finding is vague because it fails to define or describe what "short supply" means and what would qualify as a "supply shortage." Nor does the Open Offer or Respondents' amended Open Offer terms, presented in the middle of trial, define what constitutes a "supply shortage." (*See* PX0064 (Illumina, Open Offer Letter, Mar. 29, 2021); *see also* RX3935 at 001-002 (Illumina, Revised Open Offer Letter, Sept. 8, 2021)).

The proposed finding relies solely upon the self-serving testimony of Illumina's Senior Vice President and General Manager of Americas, and the Open Offer signatory, Nicole Berry. Respondents do not cite to any customers that are actually subject to the Open Offer. MCED customers are concerned about supply shortage. [redacted]

The proposed finding is misleading to the extent it implies that Illumina knows how it will "allocate the existing supply in an equitable manner among its customers" if a supply shortage were to occur. Respondents' own expert Ms. Guerin-Calvert testified that she had not seen any documents or testimony that spells out how Illumina intends to allocate short supply among its customers. (RX6002 (Guerin-Calvert Trial Dep. at 154-55)).

Ultimately, even with the Open Offer's supply shortages provision, [redacted]

[redacted]

The proposed finding is also misleading to the extent it implies that Illumina will do what is best for all its customers. The weight of the evidence shows that Illumina's reputation among its customers is poor. [redacted] Illumina's customers agree. For example, Ariosa's former CEO, Mr. Song testified that Illumina is "kind of the big bully" and "people are scared of them." (PX7071 (Song (Omniome) IHT at 43-44)). [redacted]

Additionally, Illumina does not care much about its reputation with MCED customers because MCED customers have nowhere else to go. [redacted] Singlera's Mr. Gao testified at trial that Illumina is the "800-pound" gorilla as "Illumina control[s] the supply chain for all the NGS-

based early cancer detection technology, not only for Singlera, but for other companies." (Gao (Singlera) Tr. 2947-48; *see also* PX7042 (Gao (Singlera) IHT) at 88 (describing Singlera's relationship with Illumina as like being a "prisoner of war")). Therefore, this Court should disregard the proposed finding.

To the extent this finding purports to interpret a contract term, it should be disregarded because it is not a "finding of fact," but rather a legal conclusion in contravention of this Court's order and the Part 3 rules. (*See* 16 C.F.R. § 3.46; Order on Post-Trial Findings).

> 1012.4 Under the premerger status quo, Illumina would be able to allocate short supply to GRAIL or to customers who were willing to pay the highest price. (RX6002 (Guerin-Calvert Trial Dep. at 76–77).) The short supply provision of the Open Offer addresses this concern by providing for an equitable manner of allocation. (RX6002 (Guerin-Calvert Trial Dep. at 77).) It also ensures that customers with the greatest need—those whose lots are expiring the earliest—will receive allocations of short supply first. (RX6002 (Guerin-Calvert Trial Dep. at 77).)

Response to Finding No. 1012.4

The proposed finding is vague because it fails to define or describe what "short supply" means and what would qualify as a "supply shortage." Nor does the Open Offer or Respondents' amended Open Offer terms, presented in the middle of trial, define what constitutes a "supply shortage." (*See* PX0064 (Illumina, Open Offer Letter, Mar. 29, 2021); *see also* RX3935 at 001-002 (Illumina, Revised Open Offer Letter, Sept. 8, 2021)).

The proposed finding is vague because it fails to define or describe what an "equitable manner" means.

The proposed finding relies solely upon the self-serving testimony of Illumina's Senior Vice President and General Manager of Americas, and the Open Offer signatory, Nicole Berry. Respondents do not cite to any customers that are actually subject to the Open Offer. MCED customers are concerned about supply shortage. [redacted]

[redacted]

[redacted]

The proposed finding is misleading to the extent it implies that Illumina knows how it will "allocate the existing supply in an equitable manner among its customers" if a supply shortage were to occur. Respondents' own expert Ms. Guerin-Calvert testified that she had not seen any documents or testimony that spells out how Illumina intends to allocate short supply among its customers. (RX6002 (Guerin-Calvert Trial Dep. at 154-55)).

Ultimately, even with the Open Offer's supply shortages provision, [redacted]

This Court ordered that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (*See* Order on Post-Trial Findings at 3). Here Respondents cite Guerin-Calvert as the only source of evidence supporting the proposed finding in contravention of this Court's Order. Further, it constitutes improper legal conclusion by an expert witness. The Court should disregard this evidence.

To the extent this finding purports to interpret a contract term, it should be disregarded because it is not a "finding of fact," but rather a legal conclusion in contravention of this Court's order and the Part 3 rules. (*See* 16 C.F.R. § 3.46; Order on Post-Trial Findings).

This proposed finding is misleading to the extent it purports to speak to the concerns of Illumina's customers but relies solely on the speculative, self-serving testimony of Respondents'

paid expert.

The proposed finding is also misleading to the extent it implies that Illumina will do what is best for all its customers. The weight of the evidence shows that Illumina's reputation among its customers is poor. [redacted]. Illumina's customers agree. For example, Ariosa's former CEO, Mr. Song testified that Illumina is "kind of the big bully" and "people are scared of them." (PX7071 (Song (Omniome) IHT at 43-44)). [redacted].

Additionally, Illumina does not care much about its reputation with MCED customers because MCED customers have nowhere else to go. [redacted] Singlera's Mr. Gao testified at trial that Illumina is the "800-pound" gorilla as "Illumina control[s] the supply chain for all the NGS-

based early cancer detection technology, not only for Singlera, but for other companies." (Gao (Singlera) Tr. 2947-48; *see also* PX7042 (Gao (Singlera) IHT) at 88 (describing Singlera's relationship with Illumina as like being a "prisoner of war")). Therefore, this Court should disregard the proposed finding.

4. **Pricing**

1013. The Open Offer requires Illumina to treat customers equitably relative to GRAIL and any other For-Profit Entity in terms of pricing. (deSouza (Illumina) Tr. 2402–03; PX0064 (Illumina) at 7–8.)

Response to Finding No. 1013

This proposed finding is vague, misleading, and constitutes improper legal conclusion. The term equitable is vague and is not defined here or in the Open Offer.

The term "requires" is misleading to the extent it implies that Illumina cannot breach the terms of the Open Offer. As [redacted].

The proposed finding is also misleading to the extent it implies that Illumina will do what

is best for its customers. The weight of the evidence shows that Illumina's reputation among its customers is poor. [redacted]. Illumina's customers agree. For example, Ariosa's former CEO, Mr. Song testified that Illumina is "kind of the big bully" and "people are scared of them." (PX7071 (Song (Omniome) IHT at 43-44)). [redacted].

The proposed finding is also misleading to the extent it implies that Illumina customers will know what other customers are purchasing. Even Illumina's executive and Open Offer signatory, Ms. Berry testified that under the Open Offer, a customer would not know in real-time what products its competitors are purchasing from Illumina. (PX7076 (Berry (Illumina) Dep. at 292)). Certain information, such as a customer's order information and service reports, is confidential and one customer would not have access to another customer's information). (PX7076 (Berry (Illumina) Dep. at 81; 291)). Ms. Berry testified that under the Open Offer, customers would not be able to know in real-time what prices its competitors are paying for Illumina products. (PX7076 (Berry (Illumina) Dep. at 291-92)). Therefore, this Court should disregard the proposed finding. Therefore, this Court should disregard the proposed finding.

To the extent the cited testimony purports to interpret the word "equitable," the proposed

finding should be disregarded because it is not a "finding of fact," but rather a legal conclusion in contravention of this Court's order and the Part 3 rules. (*See* 16 C.F.R. § 3.46; Order on Post-Trial Findings).

1014. Customers may select one of two options for each product purchased under the Open Offer: the pricing that they received before Illumina's acquisition of GRAIL closed ("Grandfathered Pricing") or pricing under a universal pricing grid ("Universal Pricing".) (PX0064 (Illumina) at 7.)

Response to Finding No. 1014

Complaint Counsel has no specific response to this finding.

1014.1 Grandfathered Pricing under the Open Offer is "any pricing (either under a quote of duration longer than 30 days or a supply agreement) that is operative for the Customer for use of the Supplied Products at the time that the Transaction closes, provided that this pricing is for ongoing, ordinary course purchases of Supplied Products." (PX0064 (Illumina) at 4.)

Response to Finding No. 1014.1

This proposed fact is vague and misleading. The term "ongoing, ordinary course purchases" is unclear and undefined here and in the Open Offer. Additionally, the proposed finding is vague because "operative" is undefined.

Complaint Counsel acknowledges that Respondents' Open Offer letter includes the quoted language. However, as [redacted]

[redacted].

> 1014.2 Universal Pricing under the Open Offer refers to "the Volume-Based Net Price for [any given] Supplied Product in accordance with Appendix 1" of the Open Offer. (PX0064 (Illumina) at 7.) "The universal pricing grid in Appendix 1 contains all currently available universal pricing, including list prices and volume-based discount tiers, for currently available Supplied Products, and [the Open Offer requires that] such Appendix 1 will be updated as additional pricing tiers or new Supplied Products (including new versions of existing Supplied Products) become available." (PX0064 (Illumina) at 7.) "Volume-Based Net Price" refers to "the actual list price of a Supplied Product less the applicable discount for a customer's volume under a volume-based discount schedule." (PX0064 (Illumina) at 5.)

Response to Finding No. 1014.2

Complaint Counsel acknowledges that Respondents' Open Offer letter includes the quoted language. However, the bracketed language in the proposed finding is not reflective of the text of the Open Offer. To the extent the bracketed language purports to interpret the Open Offer, it should be disregarded because it is not a "finding of fact," but rather a legal conclusion in contravention of this Court's order and the Part 3 rules. (*See* 16 C.F.R. § 3.46; Order on Post-Trial Findings).

Further, as [redacted]

[redacted]

1014.3 The Open Offer requires that "Customer will be able to select one of two options for each Supplied Product that they purchase under this Supply Agreement. Customer may elect to receive the Grandfathered Pricing that Customer received before the close of the Transaction under 5.a. . . . Alternatively, Customer may elect to switch over to receiving Universal Pricing under 5.b, under which Customer purchases each Supplied Product under the pricing in Appendix 1." (PX0064 (Illumina) at 7.)

Response to Finding No. 1014.3

Complaint Counsel acknowledges that Respondents' Open Offer letter includes the quoted language. However, the term "requires" is misleading to the extent it implies that Illumina cannot breach the terms of the Open Offer. As [redacted]

[redacted]

1014.4 Customers can pick Grandfathered Pricing for some products and Universal Pricing for others. (Berry (Illumina) Tr. at 892.)

Response to Finding No. 1014.4

This proposed finding is unsupported and constitutes improper legal opinion. It presents an interpretation of the Open Offer based solely on the self-serving testimony of an Illumina executive. Further, the proposed finding purports to interpret the Open Offer, and therefore should be disregarded because it is not a "finding of fact," but rather a legal conclusion in contravention of this Court's order and the Part 3 rules. (*See* 16 C.F.R. § 3.46; Order on Post-Trial Findings).

The proposed finding is misleading to the extent it implies that because customers have the option of Grandfathered Pricing or Universal Pricing that customer concerns are resolved regarding the Open Offer's pricing provisions. MCED customers have testified to their concerns about Illumina's Open Offer pricing provisions. First and foremost, Illumina customers will have no way to know the pricing Grail or any other customer receives from Illumina. [redacted]

Third, customers are concerned that the Open Offer's pricing provision does not provide

MCED customers the lowest pricing. [redacted]

1014.5 The ability to choose on a product-by-product basis presents benefits over the premerger status quo because it gives customers added flexibility on pricing. (RX6002 (Guerin-Calvert Trial Dep. at 37).)

Response to Finding No. 1014.5

This Court ordered that experts shall not be cited to "support factual propositions that

should be established by fact witnesses or documents." *See* Order on Post-Trial Findings at 3. Here Respondents cite Ms. Guerin-Calvert as the only source of evidence supporting this proposed fact in contravention of this Court's Order. The Court should disregard this evidence.

This proposed fact is also speculative and unsupported to the extent it speaks to what is beneficial for Illumina's customers but relies solely on the self-serving testimony of Respondents' paid expert.

This proposed finding is also vague and confusing because it refers to "benefits" but lists only one purported benefit and provides no explanation or basis for that assertion.

The proposed finding is misleading to the extent it implies that the Open Offer is sufficient because it provides customers with terms they have not had in the past. Prior to the Acquisition, Illumina contracted with customers at arms-length.

[redacted]

1015. If a customer chooses Grandfathered Pricing, it will have the option of maintaining the pricing it had prior to the Illumina-GRAIL transaction for the duration of the 12–year term of the Open Offer. (Berry (Illumina) Tr. 889–90, 902–03; PX0064 (Illumina) at 7.)

Response to Finding No. 1015

The proposed finding is misleading to the extent it implies that maintaining MCED customer pricing terms they had pre-acquisition means that the Open Offer restores the loss of competition that will take place post-acquisition.

Prior to the Acquisition, Illumina contracted with customers at arms-length. Post-Acquisition, Illumina is now interacting with customers as rivals and the incentives behind how Illumina treats customer have changed. [redacted]

1015.1 The Open Offer requires that Illumina allow any "Customer" to "continue to receive the benefit of any Grandfathered Pricing for the Term." (PX0064 (Illumina) at 7.)

Response to Finding No. 1015.1

Complaint Counsel acknowledges that Respondents' Open Offer letter includes the quoted language. [redacted]

1015.2 The Grandfathered Pricing option was included because some customers may have the view that their current (pre-merger) pricing was more favorable for a particular product than the price offered in the Open Offer. (Berry (Illumina) Tr. 889–

90.) Grandfathered Pricing was included to give customers the option to keep their legacy price. (Berry (Illumina) Tr. 889–90.)

Response to Finding No. 1015.2

The proposed finding is vague because it fails to define or describe who the phrase "some customers" includes.

The proposed finding relies solely upon the self-serving testimony of Illumina's Senior Vice President and General Manager of Americas, and Open Offer signatory, Nicole Berry. Respondents cite to no customer testimony to support their "fact" that the Grandfathered Pricing option was included because of the views "some customers may have." Additionally, the proposed finding is misleading to the extent it implies that maintaining MCED customer pricing terms they had pre-acquisition means that the Open Offer restores the loss of competition that will take place post-acquisition.

Moreover, Respondents admit that some customers may have been able to achieve "more favorable pricing for a particular product than the price offered in the Open Offer." This amplifies the deficiencies in the non-negotiated, unilateral Open Offer because, as a remedy, the terms of the Open Offer will be imposed on all of Illumina's MCED customers regardless of whether they could have achieved more favorable terms from Illumina absent the Acquisition. Therefore, this Court should disregard the proposed finding.

1015.3 If an existing customer uses Grandfathered Pricing, their prices would not increase during the 12–year term, and, provided that they continue to purchase those products, the products themselves would not be discontinued. (Berry (Illumina) Tr. 902–03.) The Open Offer requires this because of the interaction between the Grandfathered Pricing provision and the no-obsolescence provision: The no-obsolescence provision prohibits Illumina from discontinuing or rendering obsolete any Supplied Product, and the Grandfathered Pricing provision ensures that customers can continue to receive their legacy pricing over the full 12–year term. (Berry (Illumina) Tr. 902–03; PX0064 (Illumina) at 6–7.)

Response to Finding No. 1015.3

[redacted]

1016. If a customer chooses Universal Pricing, that customer will receive the standard pricing in Illumina's Universal Pricing grid. (PX0064 (Illumina) at 7.)

Response to Finding No. 1016

The proposed finding is vague because it fails to define or describe what "Illumina's Universal Pricing grid" is**.** [redacted]

1016.1 The Open Offer requires that "[i]f Customer is not receiving Grandfathered Pricing for a Supplied Product, Customer shall receive the Volume-Based

Net Price for that Supplied Product in accordance with Appendix 1." (PX0064 (Illumina) at 7.) Appendix 1 provides the Universal Pricing grid. (PX0064 (Illumina) at 12–27.)

Response to Finding No. 1016.1

Complaint Counsel acknowledges that Respondents' Open Offer letter includes the quoted language. [redacted]

[redacted]

1016.2 [redacted]

Response to Finding No. 1016.2

[redacted]

[redacted]

[redacted]

1016.3 The purpose of providing the Universal Pricing grid was to be transparent around the prices that GRAIL and other For-Profit Entities pay for the products and services it buys from Illumina. (deSouza (Illumina) Tr. 2403.)

Response to Finding No. 1016.3

The proposed finding is vague because it fails to define or describe what "transparent" means.

The proposed finding relies solely upon the self-serving testimony of Illumina's CEO, Francis deSouza. Respondents do not cite to any documentary evidence or customer testimony to support this "fact." The proposed finding is misleading to the extent it implies that Illumina included the Universal Pricing grid only because it wanted to be transparent on pricing.

The proposed finding is misleading to the extent it implies that Illumina's pricing grid is actually "universal" or transparent. Illumina pricing grid is not universal because customer have the ability to receive discretionary discounts. [redacted] It is this discretionary discounts which determines the "ultimate[] price the customer pays." (PX7063 (Berry (Illumina) IHT at 17-18)). While the Open Offer purports to equalize the volume-based discounts that

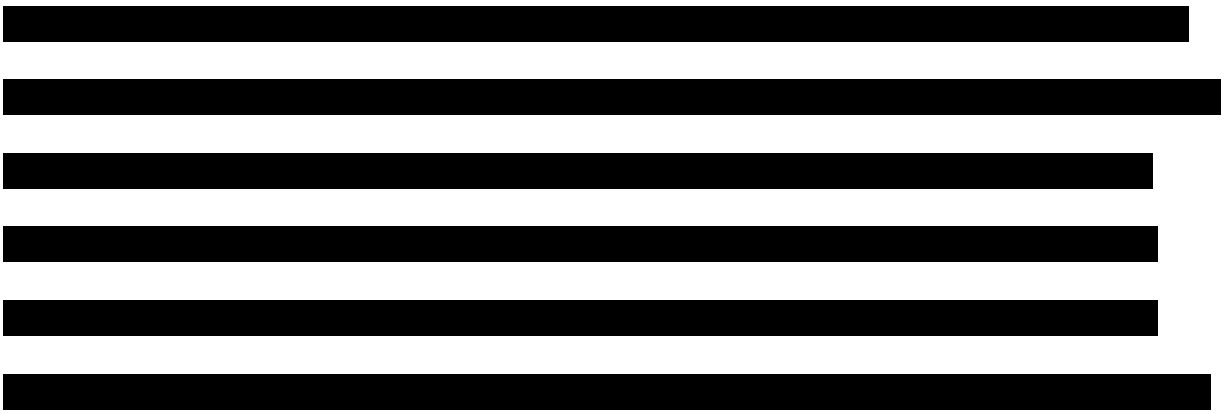
MCED test developers may receive for certain levels of sales, the Open Offer does nothing to account for these discretionary discounts. As Illumina's SVP and General Manager of the Americas, and signatory to the Open Offer, Ms. Berry, testified, under the Open Offer, customers are only eligible to receive discretionary discounts for activities that are considered "short term projects" as defined in the Open Offer, meaning the activities fall *outside* of the normal course of business. (Berry (Illumina) Tr. 925; PX0064 at 008 (Illumina Open Offer agreement, dated March 30, 2021)). Therefore, this Court should disregard the proposed finding.

> 1016.4 The Universal Pricing grid will be helpful to customers as they create multiyear business plans because they will know what prices they can access. (deSouza (Illumina) Tr. 2403, 2439.)

Response to Finding No. 1016.4

The proposed finding is vague because it does not define or describe what "access" means and nowhere in the Open Offer is the term "access" defined. (*See* PX0064 (Illumina, Open Offer Letter, Mar. 29, 2021)). Additionally, "access" is not defined in Illumina's additional supply agreement terms which were presented in the middle of trial. (RX3935 at 001-002 (Illumina, Revised Open Offer Letter, Sept. 8, 2021)).

The proposed finding relies solely upon the self-serving testimony of Illumina's CEO, Francis deSouza. Respondents do not cite to any customer testimony to support the "fact" that the Universal Pricing grid will be helpful to customers as they create multiyear business plans."



[redacted]

1016.5 GRAIL receives pricing under the Universal Pricing grid. (Berry (Illumina) Tr. 894.)

Response to Finding No. 1016.5

[redacted]

[redacted]

[redacted]

1016.6 Under Universal Pricing, customers will know with certainty that they are not disadvantaged relative to GRAIL or anyone else in the market. (deSouza (Illumina) Tr. 2403–04.)

Response to Finding No. 1016.6

The proposed finding is misleading and against the weight of the evidence to the extent it implies that customer will know what pricing Grail is receiving. [redacted]

1016.7 The Universal Pricing grid directly addresses the concern that Illumina could treat GRAIL more favorably in terms of pricing. (RX6002 (Guerin-Calvert Trial Dep. at 37–38).)

Response to Finding No. 1016.7

The proposed finding is misleading to the extent it implies that the Universal pricing grid resolves customers concerns that Illumina can favor Grail and disadvantage Grail rivals with regards to pricing. Illumina's pricing grid does not resolve the concern that Illumina customers will have no way to monitor what pricing Grail receives in order to enforce the Open Offer pricing provisions. [redacted]

[redacted]

1017. If a customer chooses Universal Pricing, it will receive "most favored nation" (MFN) pricing protections relative to Equivalent customers. (Berry (Illumina) Tr. 893; PX0064 (Illumina) at 7–8.)

Response to Finding No. 1017

The proposed finding is misleading to the extent it implies that customers will know whether they are actually receiving "most-favored nation (MFN) pricing protections relative to Equivalent customers." MCED customers will not know what pricing other customers, including Grail, are receiving from Illumina. [redacted] Even Respondents own executive and Open Offer signatory, Ms. Berry, testified that customers "would not know what prices other customers are paying. That's considered confidential information." (Berry (Illumina) Tr. 700)) [redacted]

Moreover, the Open Offer's MFN provisions provide no pricing protections related to

discounts separate and apart from volume-based discounts. The MFN provisions provide that customers shall have access to "Volume-Based Net Prices" that are no less favorable than the Volume-Based Net Prices that Grail, or equivalent customers, receive. *See* (PX0064 at 006 (Illumina, Open offer Letter, Mar. 29, 2021)). "Volume-Based Net Prices" means "the actual list price of a Supplied Product less the applicable discount for a customer's volume under a volume-based discount table." (PX0064 at 003 (Illumina, Open offer Letter, Mar. 29, 2021)). [redacted] Ultimately, it is this discretionary discounts which determines the "ultimate[] price the customer pays." (PX7063 (Berry (Illumina) IHT at 17-18)). So while the Open Offer purports to equalize the volume-based discounts that MCED test developers may receive for certain levels of sales, the Open Offer does nothing to account for these discretionary discounts. Therefore, this Court should disregard the proposed finding.

> 1017.1 The Open Offer requires that "[i]f Customer is not currently receiving Grandfathered Pricing for Supplied Product, . . . Customer shall have access to Volume-Based Net Prices (under Appendix 1) for that Supplied Product that are no less favorable (i.e., the same or better) than the Volume-Based Net Prices provided by Illumina to an Equivalent customer after the date the Transaction closes, for that Supplied Product." (PX0064 (Illumina) at 8.)

Response to Finding No. 1017.1

Complaint Counsel acknowledges that Respondents' Open Offer letter includes the quoted language. However, the term "requires" is misleading to the extent it implies that Illumina cannot breach the terms of the Open Offer. As [redacted]

[redacted]

The proposed finding is misleading to the extent it implies that customers will know whether they are actually receiving pricing that is "no less favorable (i.e., the same or better) than the Volume-Based Net Prices provided by Illumina to an Equivalent customer." MCED customers will not know what pricing other customers, including Grail, receive from Illumina.

[redacted]

[redacted] Ultimately, it is this discretionary discounts which determines the "ultimate[] price the customer pays." (PX7063 (Berry (Illumina) IHT at 17-18)). So while the Open Offer purports to equalize the volume-based discounts that MCED test developers may receive for certain levels of sales, the Open Offer does nothing to account for these discretionary discounts. Therefore, this Court should disregard the proposed finding.

1017.2 "'Equivalent' means, with respect to the comparison of Customer to another customer, that (a) the aggregate volume of all Supplied Products purchased by

such other customer from Illumina in the immediately preceding year (measured in U.S. dollars) is not more than 10% greater than the volume purchased by Customer in prior year, (b) such other customer is a For-Profit Entity, and (c) such other customer is not currently receiving Grandfathered Pricing." (PX0064 (Illumina) at 3; *see also* Berry (Illumina) Tr. 895.)

Response to Finding No. 1017.2

Complaint Counsel acknowledges that Respondents' Open Offer letter includes the quoted language. However, as [redacted]

To the extent the cited testimony purports to interpret the Open Offer, it should be disregarded because it is not a "finding of fact," but rather a legal conclusion in contravention of this Court's order and the Part 3 rules. (*See* 16 C.F.R. § 3.46; Order on Post-Trial Findings).

1017.3 Illumina has a contract with Deloitte Consulting to operationalize the terms of the Open Offer, including the MFN terms. (*See* Berry (Illumina) Tr. 800, 894–96.) Deloitte will help guarantee Illumina's compliance with the Open Offer provisions and ensure that Illumina is prompt in upholding its obligations under the agreement. (Berry (Illumina) Tr. 896–97; PX7135 (Rock Dep. at 90).) As part of its work with

> Illumina, Deloitte will help translate the definition of Equivalent customer to processes that allow Illumina to operationalize the Equivalent customer MFN term. (Berry (Illumina) Tr. 896–97.)

Response to Finding No. 1017.3

The proposed finding is vague because "operationalize," "prompt," "translate" are undefined. The proposed finding is also vague because it fails to explain or describe how Deloitte will "help guarantee Illumina's compliance with the Open Offer provisions."

It is unclear what Respondents mean by "[a]s part of its work with Illumina, Deloitte will help translate the definition of Equivalent customer to processes that allow Illumina to operationalize the Equivalent customer MFN term." If Respondents are using Deloitte to help "translate" what Equivalent customer means under the Open Offer it would seem that Illumina does not know what "equivalent customer" means under its own agreement. Thus, how can customers properly rely on the Open Offer to protected themselves from Illumina's incentive to disadvantage Grail's rivals if the meaning or use of "equivalent customer" is undecided. The proposed finding also reveals the inadequacy and insufficiency of the Open Offer as it admits that Respondents have yet to operationalize the Open Offer, despite the Open Offer becoming operative at the time the Acquisition closed on August 18, 2021, prior to trial. (*See* Op. Stmt. (Resp.) Tr. 84-85; deSouza (Illumina) Tr. 2234; Bishop (Grail) Tr. 1353; Berry (Illumina) Tr. 857); (PX0064 at 003 (Illumina, Open offer Letter, Mar. 29, 2021)). Therefore, this Court should disregard the proposed finding.

> 1017.4 If an Equivalent customer received a discretionary discount higher than the discounts in Appendix 1 for equivalent volume or a price that is lower than the prices in Appendix 1 for an equivalent volume, then Illumina would be obligated to reduce the price for other customers at the same volume levels to match the prices under such discretionary discount. (Berry (Illumina) Tr. 893–94; RX6002 (Guerin-Calvert Trial Dep. at 38–39).)

Response to Finding No. 1017.4

The proposed finding is inaccurate. The Open Offer's MFN provisions provide no pricing protections related to discounts separate and apart from volume-based discounts. The MFN provisions provide that customers shall have access to "Volume-Based Net Prices" that are no less favorable than the Volume-Based Net Prices that Grail, or equivalent customers, receive. *See* (PX0064 at 006 (Illumina, Open offer Letter, Mar. 29, 2021)). "Volume-Based Net Prices" means "the actual list price of a Supplied Product less the applicable discount for a customer's volume under a volume-based discount table." (PX0064 at 003 (Illumina, Open offer Letter, Mar. 29, 2021)). [redacted] Ultimately, it is this discretionary discounts which determines the "ultimate[] price the customer pays." (PX7063 (Berry (Illumina) IHT at 17-18)). So while the Open Offer purports to equalize the volume-based discounts that MCED test developers may receive for certain levels of sales, the Open Offer does nothing to account for these discretionary discounts.

The proposed finding is misleading to the extent it implies that customers will know whether they are actually receiving the same pricing and discounts as "Equivalent customers." [redacted]

[redacted] Even Respondents own executive and Open Offer signatory, Ms. Berry, testified that customers "would not know what prices other customers are paying. That's considered confidential information." (Berry (Illumina) Tr. 700)) [redacted] Therefore, this Court should disregard the proposed finding.

1018. If a customer chooses Universal Pricing, it will also receive MFN pricing protections relative to GRAIL. (Berry (Illumina) Tr. 893; PX0064 (Illumina) at 7–8.)

Response to Finding No. 1018

[redacted]

[redacted] Even Respondents own executive and Open Offer signatory, Ms. Berry, testified that customers "would not know what prices other customers are paying. That's considered confidential information." (Berry (Illumina) Tr. 700)). [redacted]

Therefore, this Court should disregard the proposed finding.

> 1018.1 The Open Offer requires that "[i]f Customer is not currently receiving Grandfathered Pricing for Supplied Product, Customer shall have access to Volume-Based Net Prices (under Appendix 1) for that Supplied Product that are no less favorable (i.e., the same or better) than the Volume-Based Net Prices provided to GRAIL (including of transfer pricing, portability fees, and royalties), after the date the Transaction closes, for that Supplied Product." (PX0064 (Illumina) at 8.)

Response to Finding No. 1018.1

Complaint Counsel acknowledges that Respondents' Open Offer letter includes the quoted language. However, the term "requires" is misleading to the extent it implies that Illumina cannot breach the terms of the Open Offer. As [redacted]

[redacted]

[redacted]

1018.2 Now that GRAIL is part of Illumina, it receives pricing under the Universal Pricing grid. (Berry (Illumina) Tr. 894.)

Response to Finding No. 1018.2

The proposed finding is misleading to the extent it implies that pricing Grail pays to Illumina would be anything more than an accounting entry. Now that Illumina owns Grail it is unclear what prices Grail would actually have to pay since Grail is owned by Illumina. At best, the fees paid by Grail would simply be an accounting matter.

MCED customers as well as Illumina and Grail executive agree that post-acquisition the

prices and fees Grail pays to Illumina becomes an accounting matter. [redacted]

Illumina and Grail's executives agree that post-acquisition Grail's purchase of Illumina products will be no more than an accounting entry. Illumina's CEO, Mr. deSouza, testified that the price at which Grail purchases products from Illumina represents the price at which one Illumina entity purchases from another. (deSouza (Illumina) Tr. 2465). The price Illumina charges to its Grail subsidiary for consumables and sequencers will have no net impact on the combined entity's net P&L. (deSouza (Illumina) Tr. 2467-68; 2469-70). Grail's own Vice President of Finance, Aaron Freidin, testified that while he does not know how Illumina will account for Grail's purchases of Illumina products, he does know "that it's all eliminated and you end up with a true cost at the end when you report your financials as a public company." (Freidin (Grail) Tr. 3153). Respondents' economic expert, Dr. Carlton, likewise testified that "GRAIL doesn't technically pay a price. If you want to make up a scenario in which you force GRAIL to 'pay some price,' and you call that a transfer price . . . I'm happy to make that assumption." (RX6000 (Carlton Trial Dep. at 141-42)). Therefore, this Court should disregard

the proposed finding.

> 1018.3 If GRAIL receives a discretionary discount higher than the discounts in Appendix 1 for equivalent volume or a price that is lower than the prices in Appendix 1 for an equivalent volume, then Illumina would be obliged to reduce the price for other customers at the same volume levels to match the prices under such discretionary discount. (Berry (Illumina) Tr. 893–94; RX6002 (Guerin-Calvert Trial Dep. at 38–39).)

Response to Finding No. 1018.3

This proposed finding is inherently speculative and unsupported. The proposed finding is inherently speculative because it relies solely on the self-serving testimony of an Illumina executive and Respondents' paid expert.

The term "obliged" is misleading to the extent it implies that Illumina cannot breach the terms of the Open Offer. As [redacted]

To the extent the proposed finding purports to interpret the Open Offer, it also proffers an improper legal conclusion in contravention of this Court's order and the Part 3 rules, and should be disregarded. (*See* 16 C.F.R. § 3.46; Order on Post-Trial Findings).

To the extent the proposed finding relies on Ms. Guerin-Calvert's testimony as factual support it should be disregarded because it violates this Court's order that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (*See* Order on Post-Trial Findings at 3.)

[redacted]

[redacted] Ultimately, it is this discretionary discounts which determines the "ultimate[] price the customer pays." (PX7063 (Berry (Illumina) IHT at 17-18)). So while the Open Offer purports to equalize the volume-based discounts that MCED test developers may receive for certain levels of sales, the Open Offer does nothing to account for these discretionary discounts. Therefore, this Court should disregard the proposed finding.

1018.4 Customers testified that the MFN pricing protections would help mitigate their concerns with the merger if properly executed. (*See* PX7077 (Chahine (Helio) Dep. at 114–15); PX7081 (George (Invitae) Dep. at 60–61).) [redacted]

Response to Finding No. 1018.4

[redacted]

[redacted]

[redacted]

1019. If GRAIL or an Equivalent customer receives more favorable pricing than another customer, the Open Offer requires Illumina to notify the other customer promptly and to refund any difference between the price paid by the customer and the applicable reduced price. (Berry (Illumina) Tr. 894, 914; PX0064 (Illumina) at 8.)

Response to Finding No. 1019

The proposed finding is vague because it fails to define or describe what "more favorable pricing" and "promptly" mean.

[redacted]

[redacted]

1019.1 Specifically, the Open Offer requires that, in the event that GRAIL or an Equivalent customer receives more favorable pricing, "Illumina will notify Customer promptly, and no later than 45 days after the end of the applicable Illumina fiscal quarter, and the pricing made available to Customer for the applicable Supplied Products will be reduced, effective as of the date on which GRAIL or the Equivalent customer received the triggering pricing, and Customer will receive such reduced pricing for the period of time that the triggering pricing is available to GRAIL or the Equivalent customer. With respect to units of Supplied Product ordered and invoiced pursuant to a Purchase Order accepted after the date the triggering purchase was made, and for which Customer has paid the applicable invoice, Illumina will refund to Customer the difference between the pricing made available to Customer and the triggering pricing, multiplied by the number of affected units of Supplied Product." (PX0064 (Illumina) at 8.)

Response to Finding No. 1019.1

This proposed finding is vague because the term "promptly" is unclear and undefined.

Complaint Counsel acknowledges that Respondents' Open Offer letter includes the quoted language. However, the term "requires" is misleading to the extent it implies that Illumina cannot breach the terms of the Open Offer. As [redacted]

[redacted]

[redacted]

1020. The Grandfathered Pricing, Universal Pricing and MFN provisions represent an improvement over the status quo for customers. (RX6002 (Guerin-Calvert Trial Dep. at 42–44); *see also* [redacted]

Response to Finding No. 1020

[redacted]

[redacted]

1020.1 For nearly all MCED test customers, the Open Offer Universal Pricing is superior than their current agreement prices. (RX6002 (Guerin-Calvert Trial Dep. at 43–44).) Additionally, for any current pricing that is superior under a current agreement, customers may opt for Grandfathered Pricing. (Berry (Illumina) Tr. 889–90; PX0064 (Illumina) at 7.) [redacted]

Response to Finding No. 1020.1

[redacted]

[redacted]

1020.2 An MCED test developer that currently pays list price would also receive benefits under these provisions. (RX6002 (Guerin-Calvert Trial Dep. at 44).) They have the benefit of being able to opt into a supply agreement subject to the Universal Pricing grid, should they so choose. (RX6002 (Guerin-Calvert Trial Dep. at 44).) They also

have the benefit of receiving improved discounts as their volume grows. (RX6002 (Guerin-Calvert Trial Dep. at 44).)

Response to Finding No. 1020.2

The proposed finding is misleading to the extent it implies that MCED test developers view the Open Offer pricing provisions as a "benefit." Respondents cite to no customers who are actually subject to the Open Offer to support this "fact." Instead, Respondents rely solely upon the self-serving testimony of Respondents' paid expert, Ms. Guerin-Calvert.

Further, the proposed finding is an improper use of an expert. This Court held that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." Here Respondents cite Ms. Guerin-Calvert in contravention of this Court's Order to support the fact that MCED customers "benefit" from the Open Offer's pricing provisions. *See* Order on Post-Trial Findings at 3. This Could should disregard this evidence.

The proposed finding is misleading to the extent it implies that customers "have the benefit of receiving improved discounts as their volume grows." The Open Offer's MFN provisions provide no pricing protections related to discounts separate and apart from volume-based discounts. The MFN provisions provide that customers shall have access to "Volume-Based Net Prices" that are no less favorable than the Volume-Based Net Prices that Grail, or equivalent customers, receive. *See* (PX0064 at 006 (Illumina, Open offer Letter, Mar. 29, 2021)). "Volume-Based Net Prices" means "the actual list price of a Supplied Product less the applicable discount for a customer's volume under a volume-based discount table." (PX0064 at 003 (Illumina, Open offer Letter, Mar. 29, 2021)). [redacted]

[redacted] Ultimately, it is this discretionary discounts which determines the "ultimate[] price the customer pays." (PX7063 (Berry (Illumina) IHT at 17-18)). So while the Open Offer purports to equalize the volume-based discounts that MCED test developers may receive for certain levels of sales, the Open Offer does nothing to account for these discretionary discounts. Therefore, this Court should disregard the proposed finding.

1020.3 [redacted]

Response to Finding No. 1020.3

[redacted]

[redacted]

1021. In addition to the Grandfathered Pricing, Universal Pricing and MFN terms, the Open Offer commits Illumina not to increase prices beyond inflation for the 12–year term of the agreement (*i.e.*, the "no-price-increase provision".) (Rabinowitz (Natera) Tr. 433; Berry (Illumina) Tr. 899; Conroy (Exact/Thrive) Tr. 1731; PX0064 (Illumina) at 7; [redacted]

Response to Finding No. 1021

[redacted]

[redacted]

[redacted]

1021.1 The Open Offer requires that "[t]he inflation-adjusted (based on the Bureau of Labor Statistics' Analytical Laboratory Instrument Manufacturing Index in the Producer Price Index ("PPI")) Volume-Based Net Price (under Appendix 1) that Customer has access to for each Supplied Product purchased under this Supply Agreement over the twelve (12) year term of this Supply Agreement shall not increase. To the extent Illumina's costs of goods sold for a Supplied Product materially increase due to factors beyond Illumina's control, then the Volume-Based Net Price (under Appendix 1) may increase solely to reflect that cost increase and solely for the duration of that cost increase." (PX0064 (Illumina) at 7.)

Response to Finding No. 1021.1

This proposed finding is vague because the terms "materially increase" and "factors beyond Illumina's control" are unclear and not defined. It is unclear what amounts to a material increase and what is considered "beyond Illumina's control." Additionally, it is unclear who gets to make this determination.

Complaint Counsel acknowledges that Respondents' Open Offer letter includes the quoted language. However, the term "required" is misleading to the extent it implies that Illumina cannot breach the terms of the Open Offer. [redacted]

> 1021.2 This commitment not to raise prices applies to all potential GRAIL rivals, including any companies that may develop products similar to the Galleri test. (Aravanis (Illumina) Tr. 1926.)

Response to Finding No. 1021.2

This proposed finding is inherently speculative and unsupported. The proposed finding is inherently speculative because it relies solely on the self-serving testimony of an Illumina executive. To the extent the proposed finding purports to interpret the Open Offer, it should be disregarded because it is not a "finding of fact," but rather a legal conclusion in contravention of this Court's order and the Part 3 rules. (*See* 16 C.F.R. § 3.46; Order on Post-Trial Findings).

The term "commitment" is misleading to the extent it implies that Illumina cannot breach

the terms of the Open Offer. [redacted]

> 1021.3 The no-price-increase provision applies whether a customer is using Grandfathered Pricing or Universal Pricing. (Berry (Illumina) Tr. 902; PX0064 (Illumina) at 7.)

Response to Finding No. 1021.3

This proposed finding is inherently speculative because it is not included in the relevant Open Offer term and therefore is supported solely by the self-serving testimony of an Illumina executive. Further, to the extent the proposed finding purports to interpret the Open Offer, it should be disregarded because it is not a "finding of fact," but rather a legal conclusion in contravention of this Court's order and the Part 3 rules. (*See* 16 C.F.R. § 3.46; Order on Post-Trial Findings).

The proposed finding is misleading to the extent it implies that prohibiting price increases resolves customer concerns that Illumina will have the incentive to disadvantage Grail's rivals. Additionally, the proposed finding is misleading to the extent it implies that a prohibition against

price increases will provide customers the best pricing. [redacted]

[redacted]

1021.4 The no-price-increase provision was not available to customers prior to the Open Offer. (Berry (Illumina) Tr. 900–01.)

Response to Finding No. 1021.4

This proposed finding is misleading because it omits Ms. Berry's testimony that prior to the Open Offer, "there were some supply agreements that had . . . annual price caps that related to the amount by which Illumina would be permitted to increase prices on an annual basis." (Berry (Illumina) Tr. 900).

The proposed finding is misleading to the extent it implies that the Open Offer is sufficient because it provides customers with terms they have not had in the past. Prior to the Acquisition, Illumina contracted with customers at arms-length. Post-Acquisition, Illumina is now interacting with customers as rivals and the incentives behind how Illumina treats customer have changed. (*See* CCFF ¶¶ 3079-3188) [redacted]

[redacted]

The proposed finding is misleading to the extent it implies that prohibiting price increases resolves customer concerns that Illumina will have the incentive to disadvantage Grail's rivals. Additionally, the proposed finding is misleading to the extent it implies that a prohibition against price increases will provide customers the best pricing. [redacted]

[redacted]

1021.5 [redacted]

Response to Finding No. 1021.5

[redacted]

[redacted]

1021.6 [redacted]

Response to Finding No. 1021.6

[redacted]

1022. Under the Open Offer, Illumina cannot release a new version of a Supplied Product at a higher price than the previous version, unless the new version results in a material improvement in performance or capability. (Berry (Illumina) Tr. 901–02.)

Response to Finding No. 1022

The proposed finding is vague because it fails to define or describe what "material improvement in performance and capability" means and nowhere in the Open Offer is the term "material improvement in performance or capability" defined. (*See* PX0064 (Illumina, Open Offer Letter, Mar. 29, 2021)). Additionally, "material improvement in performance or capability" is not defined in Illumina's additional supply agreement terms which were presented in the middle of trial. (RX3935 (Illumina, Revised Open Offer Letter, Sept. 8, 2021)).

The proposed finding relies solely upon the self-serving testimony of Illumina's Senior Vice President and General Manager of Americas, and the Open Offer signatory, Nicole Berry.

The proposed finding is misleading to the extent it implies that the Open Offer's "New Product Pricing" provision resolves MCED customers concerns. [redacted]

[redacted]

1022.1 The Open Offer requires that "[t]o the extent that Illumina launches a new version of any Supplied Product (e.g., a sequencing instrument of similar throughput, or a Sequencing Consumable of the same sequencing read length and similar number of sequencing reads per flow cell), the inflation-adjusted (based on the PPI) Volume-Based Net Price per gigabase of sequencing shall not be higher as compared to the Volume-Based Net Price of the prior version of the Supplied Product, provided that the new version of the Supplied Product does not result in any material improvements in performance or capability." (PX0064 (Illumina) at 7.)

Response to Finding No. 1022.1

[redacted]

1022.2 The Open Offer also requires that "[t]he price for a new Supplied Product or a new version of a materially improved Supplied Product must be commercially reasonable. For any materially improved Supplied Product, the price of the new version must take into account the value of the improvement. For avoidance of doubt, in any arbitration in which the price of a new version of a Supplied Product or a new Supplied Product is disputed, the arbitrator is empowered to determine the reasonableness of the price, including the value of the any improvement in performance or capability, and to require that Illumina charge a price that is commensurate with the improvement, as well as require any associated refunds to Customer." (RX3935 (Illumina) at 2; *see also* deSouza (Illumina) Tr. 2408.)

Response to Finding No. 1022.2

The proposed finding is vague because it fails to define or describe the terms "materially improved," "commercial reasonable," "value of the improvement," "improvement in performance or capability," and "commensurate with the improvement." Additionally, nowhere

in the Open Offer or the additional terms of the Open Offer are these terms defined. (*See* PX0064 (Illumina, Open Offer Letter, Mar. 29, 2021); RX3935 (Illumina, Revised Open Offer Letter, Sept. 8, 2021)).

The proposed finding is misleading to the extent it implies that an arbitration resolves concerns over the Open Offer's new product supplied provision. [redacted] Additionally, the "protection of arbitration does not resolve customers concerns. Arbitration takes time and involves costs. (deSouza (Illumina) Tr. 2456; PX7076 (Berry (Illumina) Dep. at 298-99); PX7105 (Getty (Guardant) Dep. at 93)). Guardant's Mr. Getty testified that the impact enforcing a breach of contract would have on Guardant is extensive. Specifically, he testified "the cost of individual's time within the organization, and the bandwidth necessary to spend with those proceedings, to ensure that, you know, we put our best foot forward" would be one such impact. (PX7105 (Getty (Guardant) Dep. at 93-94)). The cost of arbitration "while not defined in dollar amounts, ties up [Guardant's] time and energy and resources that could be deployed against development of tests for the future state. It could tie up their time for development of tests in the current state across all of the different areas that we exist in today[.]" (PX7105 (Getty (Guardant) Dep. at 93-94)). Mr. Getty also testified that arbitration with Illumina would slow down Guardant's innovation and have a very significant impact on patient care "because ultimately [Guardant would be] tied up dealing with the arbitration around a matter that we have very limited visibility into."

(PX7105 (Getty (Guardant) Dep. at 95)).

Ultimately, as Mr. Getty testified "if you were to spend a year in arbitration trying to figure out whether GRAIL had a competitive advantage that eventually, you know, sort of played out in terms of a differentiated test offering, and physicians start adopting, you know, whether or not Guardant is successful a year and a half later with an arbitration case may be frankly rendered useless because ultimately by that time, they've cemented such a position in the marketplace that they've been able to accelerate their market share well beyond what we could ever catch up to." (PX7105 (Getty (Guardant) Dep. at 95-96)).

Complaint Counsel acknowledges that Respondents' amended Open Offer letter, presented in the middle of trial, includes the quoted language. The term "requires," however is misleading to the extent it implies that Illumina cannot breach the terms of the Open Offer. As

[redacted]

Moreover, the Acquisition changes Illumina's incentives to disadvantage their MCED customers. [redacted] Guardant's Senior Vice President of Commercial, William Getty, testified that after

the acquisition, Illumina's "incentive to work with us goes down almost to nothing because ultimately we will now be competing in the same market, and therefore Illumina, as they should, will want to maintain a competitive advantage over Guardant in that space." (PX7105 (Getty (Guardant) Dep. at 68-69)). Therefore, this Court should disregard the proposed finding.

> 1022.3 The new-product-pricing provision does not obligate customers to switch to a new product. (RX6002 (Guerin-Calvert Trial Dep. at 47).) If a customer did not agree that there was a material improvement in performance or capability of a new version of a Supplied Product, they could stay with their existing product. (RX6002 (Guerin-Calvert Trial Dep. at 48).) Alternatively, if a customer felt that there was a material improvement in performance or capability, but that this improvement did not justify a new price, the customer could take this issue directly to Illumina or to arbitration. (RX6002 (Guerin-Calvert Trial Dep. at 48).)

Response to Finding No. 1022.3

The proposed finding is vague because it fails to define or describe what "material improvement in performance and capability" means and nowhere in the Open Offer is the term "material improvement in performance or capability" defined. (*See* PX0064 (Illumina, Open Offer Letter, Mar. 29, 2021)). Additionally, "material improvement in performance or capability" is not defined in Illumina's additional supply agreement terms which were presented in the middle of trial. (RX3935 (Illumina, Revised Open Offer Letter, Sept. 8, 2021)). Thus, if customers have no way to know what constitutes a "material improvement in performance or capability" of a new product how can they (1) disagree with Respondents and "stay with their existing product and (2) prove to the arbiter that a new price is not justified.

The proposed finding is misleading to the extent it implies that an arbitration resolves concerns over the Open Offer's new product supplied provision. [redacted]

[redacted] Additionally, the "protection of arbitration does not resolve customers concerns. Arbitration takes time and involves costs. (deSouza (Illumina) Tr. 2456; PX7076 (Berry (Illumina) Dep. at 298-99); PX7105 (Getty (Guardant) Dep. at 93)). Guardant's Mr. Getty testified that the impact enforcing a breach of contract would have on Guardant is extensive. Specifically, he testified "the cost of individual's time within the organization, and the bandwidth necessary to spend with those proceedings, to ensure that, you know, we put our best foot forward" would be one such impact. (PX7105 (Getty (Guardant) Dep. at 93-94)). The cost of arbitration "while not defined in dollar amounts, ties up [Guardant's] time and energy and resources that could be deployed against development of tests for the future state. It could tie up their time for development of tests in the current state across all of the different areas that we exist in today[.]" (PX7105 (Getty (Guardant) Dep. at 93-94)). Mr. Getty also testified that arbitration with Illumina would slow down Guardant's innovation and have a very significant impact on patient care "because ultimately [Guardant would be] tied up dealing with the arbitration around a matter that we have very limited visibility into." (PX7105 (Getty (Guardant) Dep. at 95)).

Ultimately, as Mr. Getty testified "if you were to spend a year in arbitration trying to figure out whether GRAIL had a competitive advantage that eventually, you know, sort of played out in terms of a differentiated test offering, and physicians start adopting, you know, whether or not Guardant is successful a year and a half later with an arbitration case may be frankly rendered useless because ultimately by that time, they've cemented such a position in the marketplace that they've been able to accelerate their market share well beyond what we could ever catch up to." (PX7105 (Getty (Guardant) Dep. at 95-96)). Therefore, this Court should

disregard the proposed finding.

1023. Under the Open Offer, Illumina also agrees that by 2025, it will continue its pre-merger approach to reducing sequencing pricing and reduce the pricing of sequencing by at least 43%, regardless of whether a customer is receiving Grandfathered Pricing or Universal Pricing. [redacted]; Berry (Illumina) Tr. 712–13, 897, 903–04; Conroy (Exact/Thrive) Tr. at 1731–32; deSouza (Illumina) Tr. 2403; PX0064 (Illumina) at 7; [redacted]

Response to Finding No. 1023

[redacted]

[redacted]

[redacted]

[redacted]

1023.1 Specifically, the Open Offer provides that "by 2025, Illumina commits that, under this Supply Agreement, the Volume-Based Net Price (under Appendix 1) to Customer per gigabase of sequencing using the highest throughput Illumina instrument then available, with the highest throughput, best-performance flow cell and kit then available, at full capacity, will be at least 43% lower than the inflation-adjusted (based on the PPI) Volume-Based Net Price (under Appendix 1 as of March 26, 2021), per gigabase of sequencing using the NovaSeq instrument, with an S4 300 flow cell, at full capacity." (PX0064 (Illumina) at 7.)

Response to Finding No. 1023.1

Complaint Counsel acknowledges that Respondents' Open Offer letter includes the quoted language. [redacted]

[redacted]

[redacted]

[redacted]

1023.2 Sequencing involves analyzing the nucleotides, or bases, of DNA or RNA in a sample. (*See* Berry (Illumina) Tr. 818–20; PX8399 (Henry (PacBio) Decl.) at 1.) A gigabase is one million DNA or RNA bases. (PX7076 (Berry (Illumina) Dep. at 265).) Sequencing flow cells are described in terms of the number of gigabases of DNA or RNA that can be sequenced. (Berry (Illumina) Tr. 904–05.) Thus, describing the price reduction using a price per gigabase nomenclature allows for normalizing different capacity flow cells and comparing different kits' pricing on an "apples-to-apples basis". (Berry (Illumina) Tr. 905; *see also* RX6002 (Guerin-Calvert Trial Dep. at 43).)

Response to Finding No. 1023.2

This proposed finding is misleading to the extent it purports to speak to the benefits of certain pricing methodology because it is based solely on the self-serving testimony of an Illumina executive and Respondents' paid expert. Further, to the extent this finding relies on Ms. Guerin-Calvert's deposition testimony, it violates this Court's order that experts shall not be cited to "support factual propositions that should be established by fact witnesses or documents." (*See* Order on Post-Trial Findings at 3).

The proposed finding is vague because it fails to define or describe what "normalizing" means.

[redacted]

[redacted]

1023.3 While the number of gigabases refers to a number of DNA or RNA bases, a "read" refers to the processing of a fragment of DNA or RNA. (*See* Berry (Illumina) Tr. 818–20; PX8399 (Henry (PacBio) Decl.) at 1–2.) Thus, if Illumina reduced price per gigabase of the S4 300 flow cell by 43%, it would also reduce the price per read by 43% because the given number of reads in that S4 300 flow cell kit is constant. (Berry (Illumina) Tr. 923.)

Response to Finding No. 1023.3

This proposed finding is misleading to the extent it purports to speak to the benefits or effects of certain pricing methodology because it is based solely on the self-serving testimony of an Illumina executive. It is also misleading because it omits Ms. Berry's testimony that the Open Offer does not commit to a price reduction for price per read. (Berry (Illumina) Tr. 923).

[redacted]

[redacted]

[redacted]

1023.4 By reducing price per gigabase, Illumina will also reduce a customer's price per sample on an absolute linear basis, presuming that the customer's assay does not change in terms of the amount of sequencing required for that sample. (Berry (Illumina) Tr. 905–06.)

Response to Finding No. 1023.4

This proposed finding is vague and misleading. The term "absolute linear basis" is unclear and undefined. This proposed finding is misleading and speculative to the extent it purports to speak to the benefits or effects of certain pricing methodology because it is based solely on the self-serving testimony of an Illumina executive.

The proposed finding relies solely upon the self-serving testimony of Illumina's own executive and Open Offer signatory, Nicole Berry, and fails to cite to any customer testimony supporting this "fact."

[redacted]

[redacted]

1023.5 The price-reduction provision is intended to commit Illumina to a significant price reduction by January 1, 2025. (Berry (Illumina) Tr. 711–12.)

Response to Finding No. 1023.5

This proposed finding is vague because the term "significant" is unclear and undefined.

The proposed finding is misleading to the extent it implies that Illumina's intention "to commit Illumina to a significant price reduction by January 1, 2025" is written into the terms of the Open Offer.

The proposed finding is misleading to the extent it implies that the Open Offer's price-reduction provisions actually commit Illumina to a significant price reduction. The Open Offer states that Illumina's "Volume-Based Net Price to Customer per gigabase of sequencing using the highest throughput Illumina instrument then available… will be at least 43% lower…" (PX0064 at 007 (Illumina Open Offer, Mar. 29, 2021)).

[redacted]

[redacted]

1023.6 Illumina selected the 43% number because that is the price Illumina assumed in its deal model that GRAIL would pay in 2025. (deSouza (Illumina) Tr. 2338; [redacted] Illumina also chose this number by considering both what customers wanted and what Illumina could achieve. (Berry (Illumina) Tr. 907–08; Aravanis (Illumina) Tr. 1868.)

Response to Finding No. 1023.6

[redacted]

[redacted]

1023.7 Although the Offer requires "at least" a 43% price reduction by January 1, 2025, Illumina intends to try to achieve that goal faster. (Aravanis (Illumina) Tr. 1868.)

Response to Finding No. 1023.7

The proposed finding is vague because it fails to define or describe what the terms "goal," "faster," and "intends to try to achieve" means. It is unclear how much "faster" Illumina "intends to try to achieve" of a 43% price reduction.

The proposed finding is misleading to the extent it implies the terms Illumina's Open Offer states that "Illumina intends to try to achieve that goal faster." Nowhere in the Open Offer, or its amended terms, does Illumina make this commitment. (PX0064 (Illumina Open Offer agreement, Mar. 29, 2021); RX3935 (Illumina, Revised Open Offer Letter, Sept. 8, 2021)).

The proposed finding is misleading to the extent it implies that there will actually be a price decrease of 43 percent to MCED customers. Specifically, the proposed finding is incomplete because Respondents omit that the 43 percent discount is only off the price per gigabase of sequencing, and it is misleading because a reduction in price per gigabase is irrelevant to MCED test developers. (PX0064 at 007 (Illumina Open Offer, Mar. 29, 2021); Berry (Illumina) Tr. 923)). Respondents use "price per gigabase" instead of price per read which is the most appropriate measure of price for liquid biopsy MCED tests. The ability to read one gigabase is equal to one billion nucleotides. Because cfDNA fragments are typically fewer than

200 base pairs long, there is no advantage to a flow cell that can read more than 200 base pairs. *See* (CCFF ¶ 292). [redacted] Thus, even comparing two different flow cells on the same sequencer shows that cost per gigabase does not correlate with cost per read. Put another way, by releasing the 300-base version of the NovaSeq S4 flow cell kit, Illumina could say it lowered the sequencing cost per gigabase by 35 percent (from $6.46 to $4.80), but in reality it simultaneously increased the cost per million reads by 12 percent (from $1.29 to $1.44). Thus, Respondents' commitment that the Open Offer

reduces price of sequencing by 43 percent per gigabase could ultimately result in a price *increase* (or, at the very least, far less than a 43 percent price decrease) to MCED test developers. Therefore, this Court should disregard the proposed finding.

> 1023.8 The 43% discount still applies even if, in 2025, the highest throughput flow cell has a material improvement in performance or capability. (Berry (Illumina) Tr. 908.)

Response to Finding No. 1023.8

The proposed finding is vague because it fails to define what a "material improvement in performance or capability" means and who gets to determine this.

The proposed finding is misleading to the extent it implies that there will actually be a price decrease of 43 percent to MCED customers. Specifically, the proposed finding is incomplete because Respondents omit that the 43 percent discount is only off the price per gigabase of sequencing, and it is misleading because a reduction in price per gigabase is irrelevant to MCED test developers. (PX0064 at 007 (Illumina Open Offer, Mar. 29, 2021); Berry (Illumina) Tr. 923)). Respondents use "price per gigabase" instead of price per read which is the most appropriate measure of price for liquid biopsy MCED tests. The ability to read one gigabase is equal to one billion nucleotides. Because cfDNA fragments are typically fewer than 200 base pairs long, there is no advantage to a flow cell that can read more than 200 base pairs. *See* (CCFF ¶ 292). [redacted]

[redacted] Thus, even comparing two different flow cells on the same sequencer shows that cost per gigabase does not correlate with cost per read. Put another way, by releasing the 300-base version of the NovaSeq S4 flow cell kit, Illumina could say it lowered the sequencing cost per gigabase by 35 percent (from $6.46 to $4.80), but in reality it simultaneously increased the cost per million reads by 12 percent (from $1.29 to $1.44). Thus, Respondents' commitment that the Open Offer reduces price of sequencing by 43 percent per gigabase could ultimately result in a price *increase* (or, at the very least, far less than a 43 percent price decrease) to MCED test developers. Therefore, this Court should disregard the proposed finding.

> 1023.9 Illumina cannot avoid its obligation under the 43% reduction provision by changing what it defines as a new product because Illumina's minimum obligation is to reduce the price of the NovaSeq S4 300 flow cell. (Berry (Illumina) Tr. 908–09.)

Response to Finding No. 1023.9

The phrase "cannot avoid" is misleading to the extent it implies that Illumina cannot breach the terms of the Open Offer. [redacted]

[redacted] Guardant's Senior Vice President of Commercial, William Getty, testified that after the acquisition, Illumina's "incentive to work with us goes down almost to nothing because ultimately we will now be competing in the same market, and therefore Illumina, as they should, will want to maintain a competitive advantage over Guardant in that space." (PX7105 (Getty (Guardant) Dep. at 68-69)).

The proposed finding is misleading to the extent it implies that there will actually be a price decrease of 43 percent to MCED customers. Specifically, the proposed finding is incomplete because Respondents omit that the 43 percent discount is only off the price per gigabase of sequencing, and it is misleading because a reduction in price per gigabase is irrelevant to MCED test developers. (PX0064 at 007 (Illumina Open Offer, Mar. 29, 2021); Berry (Illumina) Tr. 923)). Respondents use "price per gigabase" instead of price per read which is the most appropriate measure of price for liquid biopsy MCED tests. The ability to read one gigabase is equal to one billion nucleotides. Because cfDNA fragments are typically fewer than 200 base pairs long, there is no advantage to a flow cell that can read more than 200 base pairs. *See* (CCFF ¶ 292). [redacted]

[redacted] Thus, even comparing two different flow cells on the same sequencer shows that cost per gigabase does not correlate with cost per read. Put another way, by releasing the 300-base version of the NovaSeq S4 flow cell kit, Illumina could say it lowered the sequencing cost per gigabase by 35 percent (from $6.46 to $4.80), but in reality it simultaneously increased the cost per million reads by 12 percent (from $1.29 to $1.44). Thus, Respondents' commitment that the Open Offer reduces price of sequencing by 43 percent per gigabase could ultimately result in a price *increase* (or, at the very least, far less than a 43 percent price decrease) to MCED test developers.

Therefore, this Court should disregard the proposed finding.

1023.10 Illumina's track record shows that it has consistently sought to drive down pricing through innovation. (Berry (Illumina) Tr. 714–15; [redacted] Indeed, since Illumina entered the sequencing market in the mid-2000s, it has dramatically driven down the price of sequencing. (Berry (Illumina) Tr. 810–11.) Illumina lowered genomics pricing so dramatically that a writer in Forbes coined the term "Flatley's Law" to describe the price reduction achieved during the tenure of Illumina's former Chief Executive Officer, Jay Flatley. (Berry (Illumina) Tr. 810–11.)

Response to Finding No. 1023.10

[redacted]

[redacted]

[redacted]

1023.11 The price-reduction term directly addresses the foreclosure concerns that have been raised by providing a specific pricing commitment for the price of the highest throughput, best performance product on a specific future date. (RX6002 (Guerin-Calvert Trial Dep. at 49).)

Response to Finding No. 1023.11

The proposed finding is vague because it fails to define or describe what "foreclosure concerns" and "specific pricing commitment" it is referring to. The proposed finding is vague because it fails to define what "price-reduction term" it is referring to.

The proposed finding is misleading to the extent it implies that the Open Offer's pricing provisions resolve customer concerns that post-acquisition Illumina has the incentive to disadvantage Grail's rivals. MCED customers have testified to their concerns regarding the Open Offer's pricing provisions.

MCED customers testified to their concern over whether there will actually be a price decrease of 43 percent. The 43 percent discount is only off the price per gigabase of sequencing, and MCED customers testified that a reduction in price per gigabase is irrelevant to MCED test developers. (PX0064 at 007 (Illumina Open Offer, Mar. 29, 2021); Berry (Illumina) Tr. 923)). Respondents use "price per gigabase" instead of price per read which is the most appropriate measure of price for liquid biopsy MCED tests. The ability to read one gigabase is equal to one billion nucleotides. Because cfDNA fragments are typically fewer than 200 base pairs long, there is no advantage to a flow cell that can read more than 200 base pairs. *See* (CCFF ¶ 292). [redacted]

[redacted]

[redacted]

MCED customers testified to their concern over whether there will actually be a price decrease of 43 percent. The 43 percent discount is only off the price per gigabase of sequencing, and MCED customers testified that a reduction in price per gigabase is irrelevant to MCED test developers. (PX0064 at 007 (Illumina Open Offer, Mar. 29, 2021); Berry (Illumina) Tr. 923)). Respondents use "price per gigabase" instead of price per read which is the most appropriate measure of price for liquid biopsy MCED tests. The ability to read one gigabase is equal to one billion nucleotides. Because cfDNA fragments are typically fewer than 200 base pairs long, there is no advantage to a flow cell that can read more than 200 base pairs. *See* (CCFF ¶ 292).

[redacted]

[redacted]

[redacted]

1023.12 The price-reduction term represents an improvement over the status quo because the price reduction is contractually guaranteed. (RX6002 (Guerin-Calvert Trial Dep. at 52); *see* [redacted]

Response to Finding No. 1023.12

[redacted]

[redacted]

[redacted]

1023.13 [redacted]

Response to Finding No. 1023.13

[redacted]

1024. A customer who signs the Open Offer can receive short-term project pricing that is the same or better than pricing extended to GRAIL or equivalent customers for similar projects. (PX0064 (Illumina) at 8.) Illumina is also required to notify customers of short-term pricing granted to GRAIL. (PX0064 (Illumina) at 8.)

Response to Finding No. 1024

The proposed finding is vague because it fails to define what "short-term project" means. The Open Offer provides a definition for "short-term project" but that definition is also vague as it states that a short term project "means a project or circumstance giving rise to a discrete purchase of Sequencing Consumables outside of ongoing ordinary course of purchases…" (PX0064 (Illumina) at 004 (Open Offer Definition of Short Term Project, Mar. 29, 2021)). It is unclear what type of "project or circumstance" would qualify under this definition. Additionally,

the proposed finding is vague because it fails to define what "similar projects" means. The Open Offer states that a customers "Short Term Project" must be "substantially similar in size (i.e., using between 90% and 110% of the volume of Sequencing Consumables) and duration (i.e., for a period of not more than 3 months longer than the other Short Term Project)…" ((PX0064 (Illumina) at 008 (Open Offer § 5h Short Term Projects, Mar. 29, 2021)).). It is unclear whether "similar projects" in this finding means "substantially similar" as defined in the Open Offer and it is also unclear who gets to decide whether a customer's project is similar.

The proposed finding is misleading to the extent it implies customers will know what short term pricing Grail receives from Illumina. MCED customers will have no way to know what pricing Grail is received from Illumina. [redacted]

Even Illumina's own executive and Open Offer signatory, Ms. Nicole Berry, testified that under the Open Offer, customers would not be able to know in real-time what prices its competitors are paying for Illumina products. (PX7076 (Berry (Illumina) Dep. at 291-92)). Additionally, Ms. Berry testified that a customer would not know in real-time what products its competitors are purchasing from Illumina. (PX7076 (Berry (Illumina) Dep. at 292)). Therefore,

this Court should disregard the proposed finding.

> 1024.1 The Open Offer requires that "Customer shall have access to Short Term Project pricing that is no less favorable (*i.e.*, the same or better) than pricing extended to Equivalent customer or GRAIL for a Short Term Project of substantially similar size (*i.e.*, using between 90% and 110% of the volume of Sequencing Consumables) and duration (*i.e.*, for a period of not more than 3 months longer than the other Short Term Project), provided that Customer has requested such pricing. If Illumina offers GRAIL pricing for a Short Term Project under this section, Illumina shall make Customer aware of such pricing promptly, but in no event later than 45 days after the end of the applicable Illumina fiscal quarter." (PX0064 (Illumina) at 8.)

Response to Finding No. 1024.1

Complaint Counsel acknowledges that Respondents' Open Offer letter includes the quoted language. The term "requires," however is misleading to the extent it implies that Illumina cannot breach the terms of the Open Offer. [redacted]

Guardant's Senior Vice President of Commercial, William Getty, testified that after the acquisition, Illumina's "incentive to work with us goes down almost to nothing because ultimately we will now be competing in the same market, and therefore Illumina, as they should, will want to maintain a competitive advantage over Guardant in that space." (PX7105 (Getty

(Guardant) Dep. at 68-69)). Therefore, this Court should disregard the proposed finding.

> 1024.2 "'Short Term Project' means a project or circumstance giving rise to a discrete purchase of Sequencing Consumables outside of ongoing ordinary course of purchases made by a For-Profit Entity. The duration of a Short Term Project is no more than two years." (PX0064 (Illumina) at 4.)

Response to Finding No. 1024.2

Complaint Counsel acknowledges that this is the definition for "Short Term Project" provided in Illumina's Open Offer. However, the proposed finding and therefore the Open Offer's definition is vague because is unclear what type of "project or circumstance" would qualify under this definition. Additionally, the proposed finding is vague because it fails to define what "discrete purchase" means. Therefore, this Court should disregard the proposed finding.

> 1024.3 No customer, including GRAIL, can receive Short Term Project pricing for more than two consecutive years or for ordinary course purchases. (Berry (Illumina) Tr. 913; deSouza (Illumina) Tr. 2440; PX0064 (Illumina) at 8.) The Open Offer specifically provides that "[n]o customer, including GRAIL, may receive Short Term Project pricing for more than two consecutive years. No customer, including GRAIL, may use Short Term Project pricing for ongoing ordinary course purchases, including for its standard commercial testing." (PX0064 (Illumina) at 8.)

Response to Finding No. 1024.3

The proposed finding is misleading to the extent it implies that customers will know what pricing other customers are receiving from Illumina. [redacted]

[redacted] Even Illumina's own executive and Open Offer signatory, Ms. Berry, testified that under the Open Offer, customers would not be able to know in real-time what prices its competitors are paying for Illumina products. (PX7076 (Berry (Illumina) Dep. at 291-92)). Ms. Berry also testified that under the Open Offer, a customer would not know in real-time what products its competitors are purchasing from Illumina. (PX7076 (Berry (Illumina) Dep. at 292)).

The proposed finding is also misleading to the extent it implies that a customer receiving the same price as Grail means that the customer is receiving a low price. [redacted] The price at which Grail purchases products from Illumina represents the price at which one Illumina entity purchases from another. (deSouza (Illumina) Tr. 2465). The price Illumina charges to its Grail subsidiary for consumables will have no net impact on the combined entity's net P&L. (deSouza (Illumina) Tr. 2467-68). The price Illumina charges to its Grail subsidiary for sequencers will have no net impact on the combined entity's net P&L. (deSouza (Illumina) Tr. 2469-70). Grail's own Vice President of Finance, Aaron Freidin, testified that while he does not know how Illumina will account for Grail's purchases of Illumina products, he does know "that it's all eliminates and you end up with a true cost at the

end when you report your financials as a public company." (Freidin (Grail) Tr. 3153). Respondents' economic expert, Dr. Carlton, likewise testified that "GRAIL doesn't technically pay a price. If you want to make up a scenario in which you force GRAIL to 'pay some price,' and you call that a transfer price . . . I'm happy to make that assumption." (RX6000 (Carlton Trial Dep. at 141-42)). Therefore, this Court should disregard the proposed finding.

> 1024.4 The Short Term Project pricing provision was added because certain discrete situations arise where there is a good reason for a customer to pay less than the pricing in the universal grid or grandfathered pricing agreements. (Berry (Illumina) Tr. 909–10.) Short Term Project pricing was offered, for example, to support COVID-19 studies and in situations where Illumina offered to replace perished inventory, for example, from a freezer malfunctioning. (Berry (Illumina) Tr. 910–13.)

Response to Finding No. 1024.4

The proposed finding is vague because it fails to define or explain what "certain discrete situations" and "good reason" mean. It is unclear what type of situation would be considered a "discrete situation" and who gets to make this determination. Furthermore, nowhere in the Open Offer or its amended terms is such an answer provided. (PX0064 (Illumina Open Offer agreement, Mar. 29, 2021); RX3935 (Illumina, Revised Open Offer Letter, Sept. 8, 2021)).

The proposed finding relies solely on the self-serving testimony of Illumina's own executive and Open Offer signatory, Ms. Berry, and fails to cite to any customer testimony or documentary evidence to support this "fact." Therefore, this Court should disregard the proposed finding.

> 1024.5 The Short Term Project pricing provision addresses the potential foreclosure concerns that have been raised because it allows for MFN pricing relative to GRAIL and Equivalent customers for Short Term Project needs. (RX6002 (Guerin-Calvert Trial Dep. at 44–45).)

Response to Finding No. 1024.5

The proposed finding is vague because it fails to define or describe what "foreclosure concerns" means. The proposed finding is vague because it fails to explain how the Open Offer's

"Short Term Project pricing provision addressees the potential foreclosure concerns that have been raised."

The proposed finding should be disregarded because it is not a "finding of fact," but rather a legal conclusion in contravention of this Court's order and the Part 3 rules. (*See* 16 C.F.R. § 3.46; Order on Post-Trial Findings).

The proposed finding relies solely upon the self-serving testimony of Respondents' paid expert, Ms. Guerin-Calvert, and does not cite to any customer with actual experience in the industry to support Respondents' proposed "fact."

The proposed finding is misleading to the extent it implies that the Open Offer's Short Term Project provision "allows for MFN pricing relative to GRAIL and Equivalent customers for Short Term Project needs." Even with the Short Term Project provisions and its accompanying definition, customers will have no way to know what products or pricing Grail receives from Illumina. [redacted] Even Illumina's own executive and Open Offer signatory, Ms. Berry, testified that under the Open Offer, customers would not be able to know in real-time what prices its competitors are paying

for Illumina products. (PX7076 (Berry (Illumina) Dep. at 291-92)). Ms. Berry also testified that under the Open Offer, a customer would not know in real-time what products its competitors are purchasing from Illumina. (PX7076 (Berry (Illumina) Dep. at 292)). Thus, it is misleading for Respondents to claim that "the Short Term Project pricing provision addresses the potential foreclosure concerns that have been raised because it allows for MFN pricing relative to GRAIL…" when customers will have no way to know what products or pricing Grail receives from Illumina. Therefore, this Court should disregard the proposed finding.

1025. The Open Offer's pricing provisions, in their totality, address the foreclosure concerns that have been raised. (RX6002 (Guerin-Calvert Trial Dep. at 34–36).)

Response to Finding No. 1025

The proposed finding is vague and unsupported. The proposed finding is vague because Respondents fail to explain how the "totality" of the Open Offer's pricing provisions "address the foreclosure concerns." Additionally, the proposed finding is vague because it fails to cite what "foreclosure concerns" "have been raised."

The proposed finding is misleading to the extent it implies that the Open Offer's pricing provisions resolve customer concerns. MCED customers have testified to their various concerns over the Open Offer pricing provisions.

MCED customers will have no way to know what products or pricing Grail receives from Illumina. [redacted]

[redacted] Even Illumina's own executive and Open Offer signatory, Ms. Berry, testified that under the Open Offer, customers would not be able to know in real-time what prices its competitors are paying for Illumina products. (PX7076 (Berry (Illumina) Dep. at 291-92)). Ms. Berry also testified that under the Open Offer, a customer would not know in real-time what products its competitors are purchasing from Illumina. (PX7076 (Berry (Illumina) Dep. at 292)).

The Open Offer's "no price increase" term will not protect MCED customers against price increases or guarantee customers the best pricing. [redacted]

[redacted]

The Open Offer's "no price increase" term will not protect MCED customers against price increases or guarantee customers the best pricing. [redacted]

[redacted]

[redacted]

[redacted]

1025.1 The pricing provisions, in their totality, provide guarantees to potential MCED test developers that they will receive fair pricing from Illumina in the short term, medium term and long term. (RX6002 (Guerin-Calvert Trial Dep. at 53).) The provisions also treat customers fairly in terms of advance knowledge and information about pricing. (RX6002 (Guerin-Calvert Trial Dep. at 53).)

Response to Finding No. 1025.1

The proposed finding relies solely upon the self-serving testimony of Respondents' paid expert, Ms. Guerin-Calvert, and does not cite to any customer with actual experience in the industry or any customer subject to the Open Offer to support Respondents' proposed "fact."

The proposed finding is vague because it fails to define what "fair pricing" means. Nowhere in the Open Offer or its amended term does it state that MCED test developers will receive "fair pricing" from Illumina.

The proposed finding is vague because it fails to define what "treat customers fairly in terms of advance knowledge and information about pricing" means. Here, Respondents are limiting the statement that customers are treated "fairly" only to "advance knowledge" and "information about pricing." Thus, it seems Respondents are stating that the Open Offer's pricing provisions do not "treat customers fairly" when it comes to pricing and products supplied by Illumina to Grail.

The proposed finding is misleading to the extent it implies that the Open Offer's pricing provisions "treat customers fairly in terms of advance knowledge and information about

pricing." MCED customers testified that under the Open Offer they have no way of knowing what products and pricing Grail or any other customer receives. [redacted] Even Illumina's own executive and Open Offer signatory, Ms. Berry, testified that under the Open Offer, customers would not be able to know in real-time what prices its competitors are paying for Illumina products. (PX7076 (Berry (Illumina) Dep. at 291-92)). Ms. Berry also testified that under the Open Offer, a customer would not know in real-time what products its competitors are purchasing from Illumina. (PX7076 (Berry (Illumina) Dep. at 292)).

The term "guarantees" is misleading to the extent it implies that Illumina cannot breach the terms of the Open Offer. As [redacted]

[redacted] Guardant's Senior Vice President of Commercial, William Getty, testified that after the acquisition, Illumina's "incentive to work with us goes down almost to nothing because ultimately we will now be competing in the same market, and therefore Illumina, as they should, will want to maintain a competitive advantage over Guardant in that space." (PX7105 (Getty (Guardant) Dep. at 68-69)). Therefore, this Court should disregard the proposed finding.

1025.2 [redacted]

Response to Finding No. 1025.2

[redacted]

[redacted]

1025.3 [redacted]

Response to Finding No. 1025.3

[redacted]

[redacted]

5. IVD Agreements and FDA Documentation

1026. The Open Offer provides that, for 6 years after the closing of the Illumina-GRAIL transaction (*i.e.*, until August 18, 2027), customers may enter into one or more separate agreements with Illumina to develop IVD test kits for use on Illumina's platforms. (Rabinowitz (Natera) Tr. 423–24; deSouza (Illumina) Tr. 2404; PX0064 (Illumina) at 8; [redacted]

Response to Finding No. 1026

[redacted]

[redacted]

1026.1 The Open Offer requires that "Customer may enter into, at any time from today, effective as of the closing of the Transaction, until the sixth anniversary of the closing of the Transaction, an agreement with Illumina under which Customer may develop and commercialize in-vitro diagnostic ("IVD") test kits for use on Illumina's diagnostic ("Dx") sequencing platforms." (PX0064 (Illumina) at 8.)

Response to Finding No. 1026.1

Complaint Counsel acknowledges that the quoted language is provided in the Open Offer's FDA provision. However, the term "requires" is misleading to the extent it implies that Illumina cannot breach the terms of the Open Offer. As [redacted]

[redacted]

Guardant's Senior Vice President of Commercial, William Getty, testified that after the acquisition, Illumina's "incentive to work with us goes down almost to nothing because ultimately we will now be competing in the same market, and therefore Illumina, as they should, will want to maintain a competitive advantage over Guardant in that space." (PX7105 (Getty (Guardant) Dep. at 68-69)).

The proposed finding is misleading to the extent it implies that the Open Offer resolves customer concerns regarding the FDA provision. [redacted]

[redacted]

The proposed finding is misleading because it fails to mention how the IVD agreement provided in the Open Offer requires customers to pay tens of millions of dollars and requires customers to pay 6% of net IVD sales to Illumina. (PX0064 at 029-030 (Illumina Open Offer, Mar. 29, 2021)). [redacted]

> 1026.2 To ensure transparency with potential partners, the types of IVD agreements available are posted on Illumina's website. (Goswami (Illumina) Tr. 3204–07.)

Response to Finding No. 1026.2

[redacted]

The proposed finding relies solely on the testimony of Illumina's Senior Vice President of Corporate Development and Strategic Planning, Mr. Goswami, and fails to cite to any

customer testimony to support this "fact."

The proposed finding is misleading to the extent it implies that the Open Offer resolves customer concerns regarding the FDA provision. [redacted]

The proposed finding is misleading because it fails to mention how the IVD agreement provided in the Open Offer requires customers to pay tens of millions of dollars and requires customers to pay 6% of net IVD sales to Illumina. (PX0064 at 029-030 (Illumina Open Offer, Mar. 29, 2021)). [redacted]

[redacted]

The term "ensures" is misleading to the extent it implies that Illumina cannot breach the terms of the Open Offer. As [redacted] Guardant's Senior Vice President of Commercial, William Getty, testified that after the acquisition, Illumina's "incentive to work with us goes down almost to nothing because ultimately we will now be competing in the same market, and therefore Illumina, as they should, will want to maintain a competitive advantage over Guardant in that space." (PX7105 (Getty (Guardant) Dep. at 68-69)). Therefore, this Court should disregard the proposed finding.

> 1026.3 IVD agreements under the Open Offer allow for developers to create test kits for all oncology applications, including cancer screening generally and multicancer screening specifically. (Goswami (Illumina) Tr. at 3233–35; PX0064 (Illumina) at 34.)

Response to Finding No. 1026.3

The proposed finding is vague because it fails to define or explain what "oncology applications" means and includes.

The proposed finding is misleading to the extent it implies that the Open Offer resolves

customer concerns regarding the FDA provision. [redacted]

The proposed finding is misleading because it fails to mention how the IVD agreement provided in the Open Offer requires customers to pay tens of millions of dollars and requires customers to pay 6% of net IVD sales to Illumina. (PX0064 at 029-030 (Illumina Open Offer, Mar. 29, 2021)). [redacted]

1026.4 Customers are investing in developing IVD test kits under the terms of these IVD agreements. (Goswami (Illumina) Tr. 3218–19.)

Response to Finding No. 1026.4

The proposed finding relies solely on the testimony of Illumina's Senior Vice President of Corporate Development and Strategic Planning, Mr. Goswami, and fails to cite to any customer testimony to support this statement about customer behavior.

The proposed finding is misleading to the extent it implies that the Open Offer resolves customer concerns regarding the FDA provision. [redacted]

The proposed finding is misleading because it fails to mention how the IVD agreement provided in the Open Offer requires customers to pay tens of millions of dollars and requires customers to pay 6% of net IVD sales to Illumina. (PX0064 at 029-030 (Illumina Open Offer, Mar. 29, 2021)). [redacted]

[redacted]

1026.5 Test developers do not need to enter into IVD agreements to pursue either LDTs or single-site PMAs. (Goswami (Illumina) Tr. 3273.)

Response to Finding No. 1026.5

The proposed finding relies solely on the testimony of Illumina's Senior Vice President of Corporate Development and Strategic Planning, Mr. Goswami, and fails to cite to any customer testimony to support this statement about customer behavior. It is unclear what Mr. Goswami's familiarity with the FDA is

The proposed finding is misleading to the extent it implies that customers do not need an agreement with Illumina to develop a distributed or IVD test. A distributed or "kitted" IVD is an IVD test that has received PMA approval from the FDA permitting analysis by independent testing providers, such as hospitals or large reference labs like LabCorp or Quest. (Goswami (Illumina) Tr. 3186-87; Leite (Illumina) Tr. 2150; PX7049 (Bailey (PGDx) IHT at 68-69); PX7063 (Berry (Illumina) IHT at 202); PX7112 (Bailey (PGDx) Dep. at 14-18); PX7093 (Young (Illumina) Dep. at 44)). MCED customers testified that having a distributed test will the in the future of their MCED tests in order to reach more patients. An agreement with Illumina is required to pursue such a distributed test. [redacted]

[redacted]

1027. The Open Offer requires Illumina to provide customers with standard terms for IVD agreements and to provide documentation to assist the customer with FDA approval or marketing authorization. (PX0064 (Illumina) at 8; PX7093 (Young Dep. at 68).)

Response to Finding No. 1027

The proposed finding is misleading to the extent it implies that the Open Offers "FDA" provision resolves customers concerns about Illumina's ability to limit their development of distributed IVD tests. [redacted]

[redacted]

The proposed finding is misleading because it fails to mention how the IVD agreement provided in the Open Offer requires customers to pay tens of millions of dollars and requires customers to pay 6% of net IVD sales to Illumina. (PX0064 at 029-030 (Illumina Open Offer, Mar. 29, 2021)). [redacted]

The term "requires" is misleading to the extent it implies that Illumina cannot breach the terms of the Open Offer. As [redacted]

Moreover, the Acquisition changes Illumina's incentives to disadvantage their MCED customers. [redacted]

[redacted] Guardant's Senior Vice President of Commercial, William Getty, testified that after the acquisition, Illumina's "incentive to work with us goes down almost to nothing because ultimately we will now be competing in the same market, and therefore Illumina, as they should, will want to maintain a competitive advantage over Guardant in that space." (PX7105 (Getty (Guardant) Dep. at 68-69)). Therefore, this Court should disregard the proposed finding.

> 1027.1 The Open Offer requires that "Illumina will provide standard terms for Customer to enter into a stand-alone agreement to enable Customer to develop and commercialize IVD test kits on one or all of Illumina's Dx sequencing platforms. Illumina shall provide any documentation or information reasonably required for Customer to seek FDA approval or FDA marketing authorization to sell a for-profit, clinical test using the Supplied Products." (PX0064 (Illumina) at 8.)

Response to Finding No. 1027.1

The proposed finding is vague because it and the Open Offer itself fail to define or describe what the terms "standard terms," "documentation," or "information" include. Additionally, the proposed finding is vague because it and the Open Offer itself fail to explain how "documentation or information" are to be determined as "*reasonably required* for Customer to seek FDA approval…" (emphasis added). It is unclear who will decide what qualifies as "reasonably required" documentation or information.

Complaint Counsel acknowledges that Respondents' Open Offer letter includes the quoted language. The term "requires," however is misleading to the extent it implies that Illumina cannot breach the terms of the Open Offer. As [redacted]

[redacted]

Moreover, the Acquisition changes Illumina's incentives to disadvantage their MCED customers. [redacted] Guardant's Senior Vice President of Commercial, William Getty, testified that after the acquisition, Illumina's "incentive to work with us goes down almost to nothing because ultimately we will now be competing in the same market, and therefore Illumina, as they should, will want to maintain a competitive advantage over Guardant in that space." (PX7105 (Getty (Guardant) Dep. at 68-69)). Therefore, this Court should disregard the proposed finding.

1027.2 The Open Offer includes a right of reference to any relevant Illumina regulatory documentation for Illumina's IVD partners. (Leite (Illumina/InterVenn) Tr. 2156; PX0064 (Illumina) at 39; [redacted] Under this right, a partner developing on Illumina systems may reference Illumina's files in their regulatory submission. (PX0064 (Illumina) at 39; [redacted]

Response to Finding No. 1027.2

[redacted]

[redacted]

1027.3 Illumina may not withhold support of documentation and information for FDA approval even from a customer who is a cancer screening competitor. (Berry (Illumina) Tr. 914–16.)

Response to Finding No. 1027.3

The proposed finding is misleading to the extent it implies that Illumina cannot withhold documentation or information a customer needs for FDA approval. The Open Offer states that "Illumina shall provide any documentation or information reasonably required for Customer to seek FDA approval or FDA marketing authorization to sell a for-profit, clinical test using the

Supplied Products." (PX0064 at 008) Thus, from the language in the Open Offer, Illumina can withhold documentation or information for a customer if such information is not considered "reasonably required." It is unclear what is "reasonably required" documentation or information and who gets to make this determination.

The proposed finding is misleading to the extent it implies that the Open Offer resolves customer concerns regarding the FDA provision. [redacted]

The proposed finding is misleading because it fails to mention how the IVD agreement provided in the Open Offer requires customers to pay tens of millions of dollars and requires customers to pay 6% of net IVD sales to Illumina. (PX0064 at 029-030 (Illumina Open Offer, Mar. 29, 2021)). [redacted]

[redacted]

The proposed finding is misleading to the extent it implies that Illumina cannot breach the terms of the Open Offer. As [redacted] Guardant's Senior Vice President of Commercial, William Getty, testified that after the acquisition, Illumina's "incentive to work with us goes down almost to nothing because ultimately we will now be competing in the same market, and therefore Illumina, as they should, will want to maintain a competitive advantage over Guardant in that space." (PX7105 (Getty (Guardant) Dep. at 68-69)). Therefore, this Court should disregard the proposed finding.

1027.4 [redacted]

Response to Finding No. 1027.4

The proposed finding is misleading to the extent it implies that Thrive asking for FDA approval protections means that Thrive and other customers' concerns are resolved. [redacted]

The proposed finding is misleading to the extent it implies that Illumina cannot breach the terms of the Open Offer. As [redacted]

[redacted] Guardant's Senior Vice President of Commercial, William Getty, testified that after the acquisition, Illumina's "incentive to work with us goes down almost to nothing because ultimately we will now be competing in the same market, and therefore Illumina, as they should, will want to maintain a competitive advantage over Guardant in that space." (PX7105 (Getty (Guardant) Dep. at 68-69)). Therefore, this Court should disregard the proposed finding.

1028. The Open Offer provides 3 template agreement options for customers interested in IVD test kit agreements: an All-Platforms Agreement, a NextSeq Agreement, and a NovaSeq Agreement. (Goswami (Illumina) Tr. 3208; PX0064 (Illumina) at 28–40.)

Response to Finding No. 1028

The proposed finding is misleading to the extent it implies that customers are able to negotiate the terms of an Illumina IVD agreement. [redacted]

Illumina customers testified to their minimal negotiating leverage with Illumina as Illumina is their sole supplier and there are no alternatives to switch to. For example, Singlera's Mr. Gao testified the Singlera has "[z]ero pretty much" negotiating leverage with Illumina. Mr. Gao continued "not only zero, in our heart we have a resentment kind of feel. Maybe Illumina will use this strategy to suppress us." (PX7042 (Gao (Singlera) IHT at 84-85). Additionally, [redacted]

[redacted]

The proposed finding is misleading to the extent it implies that the Open Offer includes these "template agreements." The Open Offer contains a rubric outlining what may be included in the three levels of IVD agreements Illumina is willing to provide customers. The Open Offer however, does not include the actual IVD agreement a customer would sign. (*See* PX0064 at 028-40 (Illumina Open Offer Agreement, Mar. 29, 2021)). Thus, it is unclear what the final terms of an IVD agreement would entail.

The proposed finding relies solely on the testimony of Illumina's Senior Vice President of Corporate Development and Strategic Planning, Mr. Goswami, and fails to cite to any customer testimony to support this "fact."

The proposed finding is misleading to the extent it implies that the Open Offer resolves customer concerns regarding the FDA provision. [redacted]

[redacted]

The proposed finding is misleading because it fails to mention how the IVD agreement provided in the Open Offer requires customers to pay tens of millions of dollars and requires customers to pay 6% of net IVD sales to Illumina. (PX0064 at 029-030 (Illumina Open Offer, Mar. 29, 2021)). [redacted]

1028.1 These options give customers access to all of Illumina's platforms that are currently available, as well as platforms that Illumina plans to develop in the future. (Goswami (Illumina) Tr. 3207–08.)

Response to Finding No. 1028.1

The proposed finding is misleading to the extent it implies that an Illumina IVD agreement is an "option" and customers are able to negotiate the terms of such an agreement.

[redacted]

[redacted]

Illumina customers testified to their minimal negotiating leverage with Illumina as Illumina is their sole supplier and there are no alternatives to switch to. For example, Singlera's Mr. Gao testified the Singlera has "[z]ero pretty much" negotiating leverage with Illumina. Mr. Gao continued "not only zero, in our heart we have a resentment kind of feel. Maybe Illumina will use this strategy to suppress us." (PX7042 (Gao (Singlera) IHT at 84-85). Additionally, [redacted]

The proposed finding is misleading to the extent it implies that the Open Offer includes the actual IVD agreement "options." The Open Offer contains a rubric outlining what may be included in the three levels of IVD agreements Illumina is willing to provide customers. The Open Offer however, does not include the actual IVD agreement a customer would sign. (*See* PX0064 at 028-40 (Illumina Open Offer Agreement, Mar. 29, 2021)). Thus, it is unclear what the final terms of an IVD agreement would entail.

The proposed finding is vague because it does not define or describe what "access" means and nowhere in the Open Offer is the term "access" defined. (*See* PX0064 (Illumina, Open Offer Letter, Mar. 29, 2021)). Additionally, "access" is not defined in Illumina's additional

supply agreement terms which were presented in the middle of trial. (RX3935 at 001-002 (Illumina, Revised Open Offer Letter, Sept. 8, 2021))

The proposed finding relies solely on the testimony of Illumina's Senior Vice President of Corporate Development and Strategic Planning, Mr. Goswami, and fails to cite to any customer testimony to support this "fact."

The proposed finding is misleading to the extent it implies that the Open Offer resolves customer concerns regarding the FDA provision. [redacted]

The proposed finding is misleading because it fails to mention how the IVD agreement provided in the Open Offer requires customers to pay tens of millions of dollars and requires customers to pay 6% of net IVD sales to Illumina. (PX0064 at 029-030 (Illumina Open Offer, Mar. 29, 2021)). [redacted]

[redacted]

1028.2 The Open Offer lays out the summary terms for the different types of IVD agreements. (Goswami (Illumina) Tr. 3208; PX0064 (Illumina) at 28–40.) More detailed templates of the different agreements are also available to interested customers. (Goswami (Illumina) Tr. 3208.)

Response to Finding No. 1028.2

The proposed finding is vague because it fails to define or describe what the terms "summary terms," "more detailed" and "different agreements" mean. The proposed finding is vague because it fails to explain where these "more detailed templates" are located and how a customer would go about finding them. The proposed finding is also vague because it fails to explain what is included in these "more detailed templates."

The proposed finding is misleading to the extent it implies the Open Offer states that Exhibit B – IVD Test Kit Agreement Terms is only the "summary terms" and that "more detailed templates… are also available to interested customers." (PX0064 at 028 (Illumina Open Offer, Mar. 29, 2021)). It is unclear from the terms of the Open Offer how customers will know that there are "more detailed templates" available and who the customer must contact to receive such "templates."

The proposed finding is misleading to the extent it implies customers are able to negotiate the terms of an Illumina IVD agreement. [redacted]

[redacted]

Illumina customers testified to their minimal negotiating leverage with Illumina as Illumina is their sole supplier and there are no alternatives to switch to. For example, Singlera's Mr. Gao testified the Singlera has "[z]ero pretty much" negotiating leverage with Illumina. Mr. Gao continued "not only zero, in our heart we have a resentment kind of feel. Maybe Illumina will use this strategy to suppress us." (PX7042 (Gao (Singlera) IHT at 84-85). Additionally, [redacted]

The proposed finding is misleading to the extent it implies that the Open Offer includes the full terms of an Illumina IVD agreement. The Open Offer contains a rubric outlining what may be included in the three levels of IVD agreements. The Open Offer however, does not include the actual IVD agreement a customer would sign. (*See* PX0064 at 028-40 (Illumina Open Offer Agreement, Mar. 29, 2021)). Thus, it is unclear what the final terms of an IVD agreement would entail.

The proposed finding relies solely on the testimony of Illumina's Senior Vice President

of Corporate Development and Strategic Planning, Mr. Goswami, and fails to cite to any customer testimony to support this "fact." Therefore, this Court should disregard the proposed finding.

> 1028.3 The terms in the Open Offer's template IVD agreements are standard in the industry and are generally accepted by companies like Thermo Fisher that serve multiple clients in the same industry. (Goswami (Illumina) Tr. 3210, 3212, 3215, 3228–29; *see* [redacted] Dr. Joydeep Goswami, Illumina's Chief Strategy and Corporate Development Officer, worked at Thermo Fisher for 16 years and led its clinical oncology and NGS division. (Goswami (Illumina) Tr. 3181.) Dr. Goswami confirmed that the Open Offer's IVD agreement terms reflect industry standards. (Goswami (Illumina) Tr. 3210, 3212, 3215, 3228–29.)

Response to Finding No. 1028.3

The proposed finding is vague because it fails to define or explain what "standard in the industry" and "industry standards" mean and what "industry" is being referred to. The proposed finding is vague because it fails to define or describe what the terms "generally accepted" and "same industry" mean.

[redacted]

[redacted]

The proposed finding is misleading to the extent it implies that Thermo's IVD agreements have the same monetary fees, in the tens of millions with revenue shares, as Illumina's IVD agreement include.

The proposed finding is misleading to the extent it implies that the Open Offer includes the full terms of an Illumina IVD agreement. The Open Offer contains a rubric outlining what may be included in the three levels of IVD agreements. The Open Offer however, does not include the actual IVD agreement a customer would sign. (*See* PX0064 at 028-40 (Illumina Open Offer Agreement, Mar. 29, 2021)). Thus, it is unclear what the final terms of an IVD agreement would entail. Therefore, this Court should disregard the proposed finding.

1029. A customer can develop an unlimited number of IVD test kits under the All-Platforms Agreement. (Goswami (Illumina) Tr. 3208–09; PX0064 (Illumina) at 28.) For the NextSeq Agreement and the NovaSeq Agreement, customers can develop up to 3 tests. (Goswami (Illumina) Tr. 3209; PX0064 (Illumina) at 28.)

Response to Finding No. 1029

The proposed finding is misleading to the extent it implies that the Open Offer includes the full terms of an Illumina IVD agreement. The Open Offer contains a rubric outlining what may be included in the three levels of IVD agreements. The Open Offer however, does not include the actual IVD agreement a customer would sign. (*See* PX0064 at 028-40 (Illumina Open Offer Agreement, Mar. 29, 2021)). Thus, it is unclear what the final terms of an IVD agreement would entail.

The proposed finding is misleading to the extent it implies that Illumina provides a customer the ability to develop IVD test kits at a low price. The IVD agreement rubric provided

in the Open Offer requires customers to pay tens of millions of dollars and requires customers to pay 6% of net IVD sales to Illumina. (PX0064 at 029-030 (Illumina Open Offer, Mar. 29, 2021)). For example, if a customer wants to develop an "unlimited" amount of IVD test kits, the customer will have to pay a $25 million tech access fee, development milestone payments of $1 million per IVD test kit on the NextSeqDx platform, $5 million per IVD test kit on the NovaSeqDx platform, and an unknown dollar amount per IVD test kit on "future platforms," and a revenue share of 6% of net sales of the IVD test kits. (PX0064 at 029-030 (Illumina Open Offer, Mar. 29, 2021)). Therefore, this Court should disregard the proposed finding.

1029.1 Illumina determined the number of tests that customers could develop on each platform based on what Illumina had agreed to with previous partners. (Goswami (Illumina) Tr. 3209.)

Response to Finding No. 1029.1

The proposed finding is vague because it is unclear whether Respondents are referring to the "unlimited" or three test kits only IVD agreement options. The proposed finding is vague because it fails to define who these "previous partners" are and whether they are clinical customers and specifically cancer detection partners.

The proposed finding relies solely on the testimony of Illumina's Senior Vice President of Corporate Development and Strategic Planning, Mr. Goswami, and fails to cite to any customer testimony to support this "fact." Therefore, this Court should disregard the proposed finding.

1030. All IVD agreements under the Open Offer extend to all jurisdictions worldwide where Illumina has obtained regulatory clearance for the instruments. (Goswami (Illumina) Tr. 3209; PX0064 (Illumina) at 28.)

Response to Finding No. 1030

Complaint Counsel acknowledges that the following language is included in Illumina's Open Offer, "Territory[:] Worldwide, in jurisdictions where the applicable IVD Hardware has

regulatory approval." (PX0064 at 028 Illumina Open Offer, Mar. 29, 2021)).

The proposed finding is misleading to the extent it implies that the this territory language will be included in an executed Illumina IVD agreement. The Open Offer contains a rubric outlining what may be included in the three levels of IVD agreements. The Open Offer however, does not include the actual IVD agreement a customer would sign. (*See* PX0064 at 028-40 (Illumina Open Offer Agreement, Mar. 29, 2021)). Thus, it is unclear what the final terms of an IVD agreement would entail.

The proposed finding is misleading to the extent it implies that Illumina cannot breach the terms of the Open Offer. As [redacted] Guardant's Senior Vice President of Commercial, William Getty, testified that after the acquisition, Illumina's "incentive to work with us goes down almost to nothing because ultimately we will now be competing in the same market, and therefore Illumina, as they should, will want to maintain a competitive advantage over Guardant in that space." (PX7105 (Getty (Guardant) Dep. at 68-69)). Therefore,

this Court should disregard the proposed finding.

1031. The All-Platforms Agreement has a 15–year term. (Goswami (Illumina) Tr. 3210; PX0064 (Illumina) at 29.) The NextSeq Agreement and the NovaSeq Agreement have 10–year terms. (Goswami (Illumina) Tr. 3210; PX0064 (Illumina) at 29.) Developers may also commercialize their tests beyond the stated term lengths. (Goswami (Illumina) Tr. 3210; PX0064 (Illumina) at 29.)

Response to Finding No. 1031

The proposed finding is vague because it is unclear what "developers may also commercialize their tests beyond the stated term lengths." The proposed finding is misleading because it fails to acknowledge an important limitation on a customer's ability to "commercialize their tests beyond the states term length." Specifically, the Open Offer's IVD agreement rubric states "Continued Commercialization: After expiration of the Term, Customer may continue commercializing IVD Test Kits that were launched before expiration of the Term *for so long as* Illumina is still commercializing the applicable Sequencing Consumables and servicing and supporting the applicable IVD Hardware in the applicable Territory." (PX0064 at 029 (Illumina Open Offer Agreement, Mar. 29, 2021) (emphasis added)). Thus, a customer may be limited from commercializing its IVD test kit if Illumina is no longer "commercializing the applicable Seqeuncing Consumables and servicing and support the applicable IVD Hardware in the applicable Territory." It is unclear what amount to an "applicable" consumable or IVD Hardware means or who gets to make this determination. Additionally, it is unclear what amount to "servicing" or "support" and who gets to make this determination.

The proposed finding is misleading to the extent it implies that the term length referred to here is guaranteed to be included in an executed Illumina IVD agreement. The Open Offer contains a rubric outlining what may be included in the three levels of IVD agreements. The Open Offer however, does not include the actual IVD agreement a customer can sign. (*See* PX0064 at 028-40 (Illumina Open Offer Agreement, Mar. 29, 2021)). Thus, it is unclear what the

final terms of an IVD agreement will entail. Therefore, this Court should disregard the proposed finding.

> 1031.1 Specifically, the Open Offer requires that, for the All-Platforms Agreement, the "Term of Agreement (during which time Customer could sell IVD Test Kits) would be 15 years from the date the Transaction closes. Customer could enter into new IVD Plans for IVD Test Kit development during the first 10 years (the 'Development Term')". (PX0064 (Illumina) at 29.) For the NextSeq Agreement, the Open Offer requires that the term is "10 years from the date the Transaction closes". (PX0064 (Illumina) at 29.) And for the NovaSeq Agreement, the Open Offer requires that the term is "10 years from the later of (i) the date the Transaction closes or (ii) the date NovaSeqDx is listed with FDA in the U.S. pursuant to applicable law". (PX0064 (Illumina) at 29.)

Response to Finding No. 1031.1

The proposed finding is misleading to the extent it implies that the term length referred to here is guaranteed to be included in an executed Illumina IVD agreement. The Open Offer contains a rubric outlining what may be included in the three levels of IVD agreements. The Open Offer however, does not include the actual IVD agreement a customer can sign. (*See* PX0064 at 028-40 (Illumina Open Offer Agreement, Mar. 29, 2021)). Thus, it is unclear what the final terms of an IVD agreement will entail. Therefore, this Court should disregard the proposed finding.

> 1031.2 The Open Offer also requires that "[a]fter expiration of the Term, Customer may continue commercializing IVD Test Kits that were launched before expiration of the Term for so long as Illumina is still commercializing the applicable Sequencing Consumables and servicing and supporting" the applicable instruments in the applicable territory. (PX0064 (Illumina) at 29.)

Response to Finding No. 1031.2

The proposed finding is vague because it fails to define or describe what the phrases "servicing and supporting," "applicable instruments," "applicable territory" mean. The proposed finding is misleading because it fails to acknowledge an important limitation on a customer's ability to "commercialize their tests beyond the states term length." Specifically, the Open

Offer's IVD agreement rubric states "Continued Commercialization: After expiration of the Term, Customer may continue commercializing IVD Test Kits that were launched before expiration of the Term *for so long as* Illumina is still commercializing the applicable Sequencing Consumables and servicing and supporting the applicable IVD Hardware in the applicable Territory." (PX0064 at 029 (Illumina Open Offer Agreement, Mar. 29, 2021) (emphasis added)). Thus, a customer may be limited from commercializing its IVD test kit if Illumina is no longer "commercializing the applicable Sequencing Consumables and servicing and support the applicable IVD Hardware in the applicable Territory." It is unclear what amount to an "applicable" consumable or IVD Hardware means or who gets to make this determination. Additionally, it is unclear what amount to "servicing" or "support" and who gets to make this determination.

The proposed finding is misleading to the extent it implies that the term lengths referred to here are guaranteed to be included in an executed Illumina IVD agreement. The Open Offer contains a rubric outlining what may be included in the three levels of IVD agreements. The Open Offer however, does not include the actual IVD agreement a customer can sign. (*See* PX0064 at 028-40 (Illumina Open Offer Agreement, Mar. 29, 2021)). Thus, it is unclear what the final terms of an IVD agreement will entail. Therefore, this Court should disregard the proposed finding.

> 1031.3 Illumina selected the 10 and 15–year terms based on industry standards and the goal of giving customers enough time to develop kits on the relevant platforms. (Goswami (Illumina) Tr. 3210.)

Response to Finding No. 1031.3

The proposed finding is vague because it fails to define or explain what "industry standards" mean and what "industry" Respondents are referring to.

The proposed finding relies solely on the testimony of Illumina's Senior Vice President

of Corporate Development and Strategic Planning, Mr. Goswami, and fails to cite to any customer testimony or other "industry" participates to support what the "industry standard" is and what Illumina's goal is.

The proposed finding is misleading to the extent it implies that the term lengths referred to in the Open Offer are guaranteed to be included in an executed Illumina IVD agreement. The Open Offer contains a rubric outlining what may be included in the three levels of IVD agreements. The Open Offer, however, does not include the actual IVD agreement a customer can sign. (*See* PX0064 at 028-40 (Illumina Open Offer Agreement, Mar. 29, 2021)). Thus, it is unclear what the final terms of an IVD agreement will entail. Therefore, this Court should disregard the proposed finding.

1032. The Open Offer's IVD agreement templates include 3 types of financial considerations: (1) a technology access fee, paid upfront; (2) milestones due when a test developer progresses towards development of a kit; and (3) a 6% revenue share due only after the developer launches the kit. (PX0064 (Illumina) at 29–30.)

Response to Finding No. 1032

The proposed finding is misleading to the extent it implies that the financial consideration referred to in the Open Offer are guaranteed to be included in an executed Illumina IVD agreement. The Open Offer contains a rubric outlining what may be included in the three levels of IVD agreements. The Open Offer, however, does not include the actual IVD agreement a customer can sign. (*See* PX0064 at 028-40 (Illumina Open Offer Agreement, Mar. 29, 2021)). Thus, it is unclear what the final terms of an IVD agreement will entail.

The proposed finding is misleading to the extent it implies that customer monetary payments under the Open Offer's IVD agreement rubrics are insignificant amounts. Under the IVD agreement rubric provided in the Open Offer requires customers to pay tens of millions of dollars and requires customers to pay 6% of net IVD sales to Illumina. (PX0064 at 029-030

(Illumina Open Offer, Mar. 29, 2021)). For example, if a customer wants to develop an "unlimited" amount of IVD test kits, the customer will have to pay a $25 million tech access fee, development milestone payments of $1 million per IVD test kit on the NextSeqDx platform, $5 million per IVD test kit on the NovaSeqDx platform, and an unknown dollar amount per IVD test kit on "future platforms," and a revenue share of 6% of net sales of the IVD test kits. (PX0064 at 029-030 (Illumina Open Offer, Mar. 29, 2021)). [redacted]

Therefore, this Court should disregard the proposed finding.

1032.1 The financial terms of the agreements are standard in the industry. (Goswami (Illumina) Tr. 3212; [redacted] PX7097 (Felton (Thermo Fisher) Dep. at 127–29).)

Response to Finding No. 1032.1

The proposed finding is vague because it fails to define or explain what "standard in the industry" and "industry standards" mean and what "industry" is being referred to. The proposed finding is vague because it fails to define or describe what the terms "generally accepted" and "same industry" mean.

The proposed finding is misleading to the extent it implies Thermo Fisher testified that Illumina's Open Offer "IVD agreements are standard in the industry." [redacted]

[redacted]

The proposed finding is misleading to the extent it implies that Thermo's IVD agreements have the same monetary fees, in the tens of millions with revenue shares, as Illumina's IVD agreement include.

The proposed finding is misleading to the extent it implies that the financial consideration referred to in the Open Offer are guaranteed to be included in an executed Illumina IVD agreement. The Open Offer contains a rubric outlining what may be included in the three levels of IVD agreements. The Open Offer, however, does not include the actual IVD agreement a customer can sign. (*See* PX0064 at 028-40 (Illumina Open Offer Agreement, Mar. 29, 2021)). Thus, it is unclear what the final terms of an IVD agreement will entail. Therefore, this Court should disregard the proposed finding.

> 1032.2 The financial terms are split into 3 components to ensure fairness and to distribute the fees over a period of time based on the success and commercial milestones of the developer. (Goswami (Illumina) Tr. 3213.)

Response to Finding No. 1032.2

The proposed finding is vague because it fails to define or describe what "fairness" means.

The proposed finding relies solely on the testimony of Illumina's Senior Vice President of Corporate Development and Strategic Planning, Mr. Goswami, and fails to cite to any

customer testimony or documentary evidence to support the claim that Illumina's IVD agreement financial terms are split into three components to "ensure fairness". Additionally, Respondents fail to cite to any customer testimony to support their statement about distributing the fees over a period of time that is "based on the success and commercial milestones of the developer."

The proposed finding is misleading to the extent it implies that the financial consideration referred to in the Open Offer are guaranteed to be included in an executed Illumina IVD agreement. The Open Offer contains a rubric outlining what may be included in the three levels of IVD agreements. The Open Offer, however, does not include the actual IVD agreement a customer can sign. (*See* PX0064 at 028-40 (Illumina Open Offer Agreement, Mar. 29, 2021)). Thus, it is unclear what the final terms of an IVD agreement will entail.

The proposed finding is misleading to the extent it implies that customer monetary payments under the Open Offer's IVD agreement rubrics are insignificant amounts. Under the IVD agreement rubric provided in the Open Offer requires customers to pay tens of millions of dollars and requires customers to pay 6% of net IVD sales to Illumina. (PX0064 at 029-030 (Illumina Open Offer, Mar. 29, 2021)). For example, if a customer wants to develop an "unlimited" amount of IVD test kits, the customer will have to pay a $25 million tech access fee, development milestone payments of $1 million per IVD test kit on the NextSeqDx platform, $5 million per IVD test kit on the NovaSeqDx platform, and an unknown dollar amount per IVD test kit on "future platforms," and a revenue share of 6% of net sales of the IVD test kits. (PX0064 at 029-030 (Illumina Open Offer, Mar. 29, 2021)). [redacted]

Therefore, this Court should disregard the proposed finding.

1032.3 For the All-Platforms Agreement, the technology access fee is $25 million. (PX0064 (Illumina) at 29.) The technology access fee for the NextSeq

> Agreement is $3 million and the technology access fee for the NovaSeq Agreement is $15 million. (PX0064 (Illumina) at 29.) The technology access fees were selected based on recovering Illumina's upfront investment in the platforms and staying consistent with standard market. (Leite (Illumina/InterVenn) Tr. 2162–63; Goswami (Illumina) Tr. 3213–14.)

Response to Finding No. 1032.3

The proposed finding is vague because it fails to define or explain what the phrases "recovering Illumina's upfront investment" and "standard market" mean. The proposed finding relies solely on the testimony of Illumina's Senior Vice President of Corporate Development and Strategic Planning, Mr. Goswami, and Illumina's former Vice President of Business Development, Mr. Leite, and fails to cite to any customer testimony or documentary evidence to support the claim "the technology access fees were selected based on recovering Illumina's upfront investment in the platforms and staying consistent with standard market."

The proposed finding is misleading to the extent it implies that the financial consideration referred to in the Open Offer are guaranteed to be included in an executed Illumina IVD agreement. The Open Offer contains a rubric outlining what may be included in the three levels of IVD agreements. The Open Offer, however, does not include the actual IVD agreement a customer can sign. (*See* PX0064 at 028-40 (Illumina Open Offer Agreement, Mar. 29, 2021)). Thus, it is unclear what the final terms of an IVD agreement will entail.

The proposed finding is misleading to the extent it implies that customer monetary payments under the Open Offer's IVD agreement rubrics are insignificant amounts. Under the IVD agreement rubric provided in the Open Offer requires customers to pay tens of millions of dollars and requires customers to pay 6% of net IVD sales to Illumina. (PX0064 at 029-030 (Illumina Open Offer, Mar. 29, 2021)). For example, if a customer wants to develop an "unlimited" amount of IVD test kits, the customer will have to pay a $25 million tech access fee, development milestone payments of $1 million per IVD test kit on the NextSeqDx platform, $5

million per IVD test kit on the NovaSeqDx platform, and an unknown dollar amount per IVD test kit on "future platforms," and a revenue share of 6% of net sales of the IVD test kits. (PX0064 at 029-030 (Illumina Open Offer, Mar. 29, 2021)). [redacted]

The proposed finding is misleading to the extent it implies that Illumina selected fee amounts based on "recovering Illumina's upfront investment in the platforms and staying consistent with standard market." [redacted]

1032.4 The 6% revenue share was chosen based on a midpoint of what is common in the life sciences and diagnostics industry. (Goswami (Illumina) Tr. 3215.)

Response to Finding No. 1032.4

The proposed finding is vague because it fails to define or explain what the phrases "midpoint," "common," "life sciences" and "diagnostic industry" mean. The proposed finding relies solely on the testimony of Illumina's Senior Vice President of Corporate Development and Strategic Planning, Mr. Goswami, and fails to cite to any customer testimony, industry

participant testimony, or documentary evidence to support the claim "the 6% revenue share was chosen based on a midpoint of what is common in the life sciences and diagnostics industry."

The proposed finding is misleading to the extent it implies that the financial consideration referred to in the Open Offer are guaranteed to be included in an executed Illumina IVD agreement. The Open Offer contains a rubric outlining what may be included in the three levels of IVD agreements. The Open Offer, however, does not include the actual IVD agreement a customer can sign. (*See* PX0064 at 028-40 (Illumina Open Offer Agreement, Mar. 29, 2021)). Thus, it is unclear what the final terms of an IVD agreement will entail.

The proposed finding is misleading to the extent it implies that customer monetary payments under the Open Offer's IVD agreement rubrics are insignificant amounts. Under the IVD agreement rubric provided in the Open Offer requires customers to pay tens of millions of dollars and requires customers to pay 6% of net IVD sales to Illumina. (PX0064 at 029-030 (Illumina Open Offer, Mar. 29, 2021)). For example, if a customer wants to develop an "unlimited" amount of IVD test kits, the customer will have to pay a $25 million tech access fee, development milestone payments of $1 million per IVD test kit on the NextSeqDx platform, $5 million per IVD test kit on the NovaSeqDx platform, and an unknown dollar amount per IVD test kit on "future platforms," and a revenue share of 6% of net sales of the IVD test kits. (PX0064 at 029-030 (Illumina Open Offer, Mar. 29, 2021)). [redacted]

The proposed finding is misleading to the extent it implies that Illumina selected the 6% revenue share amount based on "a midpoint of what is common in the life sciences and diagnostics industry." [redacted]

[redacted]

1032.5 The milestone payments were determined based on securing a return on Illumina's initial investment, as well as on previous successful negotiations with partners. (Goswami (Illumina) Tr. 3215–16.)

Response to Finding No. 1032.5

The proposed finding is vague because it fails to define or explain what the phrases "securing a return," "Illumina's initial investment," "previous successful negotiations" and "partners" mean. It is unclear who these "partners" Respondents refer to include.

The proposed finding relies solely on the testimony of Illumina's Senior Vice President of Corporate Development and Strategic Planning, Mr. Goswami, and fails to cite to any customer testimony or documentary evidence to support the claim "The milestone payments were determined based on securing a return on Illumina's initial investment, as well as on previous successful negotiations with partners."

The proposed finding is misleading to the extent it implies that the financial consideration referred to in the Open Offer are guaranteed to be included in an executed Illumina IVD agreement. The Open Offer contains a rubric outlining what may be included in the three levels of IVD agreements. The Open Offer, however, does not include the actual IVD agreement a

customer can sign. (*See* PX0064 at 028-40 (Illumina Open Offer Agreement, Mar. 29, 2021)). Thus, it is unclear what the final terms of an IVD agreement will entail.

The proposed finding is misleading to the extent it implies that customer monetary payments under the Open Offer's IVD agreement rubrics are insignificant amounts. Under the IVD agreement rubric provided in the Open Offer requires customers to pay tens of millions of dollars and requires customers to pay 6% of net IVD sales to Illumina. (PX0064 at 029-030 (Illumina Open Offer, Mar. 29, 2021)). For example, if a customer wants to develop an "unlimited" amount of IVD test kits, the customer will have to pay a $25 million tech access fee, development milestone payments of $1 million per IVD test kit on the NextSeqDx platform, $5 million per IVD test kit on the NovaSeqDx platform, and an unknown dollar amount per IVD test kit on "future platforms," and a revenue share of 6% of net sales of the IVD test kits. (PX0064 at 029-030 (Illumina Open Offer, Mar. 29, 2021)). [redacted]

The proposed finding is misleading to the extent it implies that Illumina selected the milestone payments amounts "based on securing a return on Illumina's initial investment, as well as on previous successful negotiations with partners." [redacted]

[redacted]

1032.6 Developers who develop competing tests to those being developed by Illumina are not charged more than noncompetitors under the Open Offer. (Goswami (Illumina) Tr. 3216.)

Response to Finding No. 1032.6

The proposed finding relies solely on the testimony of Illumina's Senior Vice President of Corporate Development and Strategic Planning, Mr. Goswami, and fails to cite to any customer testimony or documentary evidence to support the "fact."

The proposed finding is misleading because the fact that all customers may be paying the same for an IVD agreement does not prove that Illumina did not select these monetary terms to offset their loss from competitive tests, but at now applying them to all customers.

[redacted] Thus, the fact that all customers are subject to the same high monetary fees does not mean Illumina selected these fees for any other reason than offsetting their loss from

competitor tests. Therefore, this Court should disregard the proposed finding.

1033. The Open Offer provides for interested customers to submit proposed IVD plans to Illumina, which Illumina may not unreasonably reject. (PX0064 (Illumina) at 34–35.)

Response to Finding No. 1033

The proposed finding is vague because "IVD plans" is undefined. The Open Offer states that a "IVD Plan" is a "development plan" which sets out "the parties' specific development obligations and timelines with respect to each IVD Test Kit." (PX0064 at 034 (Illumina Open Offer, Mar. 29, 2021)). It is unclear what IVD Plans are used for or why an IVD Plan may be rejected.

The proposed finding is vague because it is unclear what amounts to a reasonable rejection under the Open Offer. Additionally, who gets to decide whether a rejection is reasonable and what is a customer's ability to challenge this if the customer does not agree with the reasonableness determination. Therefore, this Court should disregard the proposed finding.

> 1033.1 The Open Offer requires that "[e]ach IVD Test Kit, and the parties' specific development obligations and timelines with respect to each IVD Test Kit, would be described in a development plan to be negotiated in good faith (each, an 'IVD Plan'.) Customer would propose potential IVD Plans. Illumina may not unreasonably reject any proposed IVD Plan." (PX0064 (Illumina) at 34–35.)

Response to Finding No. 1033.1

The proposed finding is vague because it is unclear what IVD Plans are used for or why an IVD Plan may be rejected.

The proposed finding is vague because it is unclear what amounts to a reasonable rejection under the Open Offer. Additionally, who gets to decide whether a rejection is reasonable and what is a customer's ability to challenge this if the customer does not agree with the reasonableness determination.

> 1033.2 Illumina provides two categories of information to customers during the IVD agreement process: (1) an overview of countries where Illumina has regulatory

approval and the number of instruments in each region or country and (2) authorization to access the device master file when the customer requires it for FDA approval. (Goswami (Illumina) Tr. 3223–24.)

Response to Finding No. 1033.2

The proposed finding relies solely on the testimony of Illumina's Senior Vice President of Corporate Development and Strategic Planning, Mr. Goswami, and fails to cite to any customer testimony or documentary evidence to support what information is provided to customers.

The proposed finding is vague because it fails to define or describe what "the device master file" is. Therefore, this Court should disregard the proposed finding.

1033.3 In the IVD agreement process, Illumina receives from developers only basic information about the kind of test the developer is creating and the developer's development plans. (Goswami (Illumina) Tr. 3226–27.) This information is to help Illumina plan for certain commitments and obligations that it has to the developer. (Goswami (Illumina) Tr. 3227.)

Response to Finding No. 1033.3

The proposed finding is misleading to the extent it implies that "in the IVD agreement process, Illumina receives from developers only basic information about the kind of test the developer is creating and the developer's development plans." [redacted] Therefore, this Court should disregard the proposed finding.

1033.4 Illumina does not receive access to proprietary information from developers through the IVD agreement process. (Goswami (Illumina) Tr. 3227.)

Response to Finding No. 1033.4

The proposed finding relies solely on the testimony of Illumina's Senior Vice President

of Corporate Development and Strategic Planning, Mr. Goswami, and fails to cite to any customer testimony or documentary evidence to support the claim that customers do not provide proprietary information to Illumina.

The proposed finding is misleading to the extent it implies that "Illumina does not receive access to proprietary information from developers through the IVD agreement process."

Therefore, this Court should disregard the proposed finding.

Response to Finding No. 1034.1

[redacted]

[redacted]

1034.2 [redacted]

Response to Finding No. 1034.2

[redacted]

1034.3 The terms of IVD agreements that Illumina has entered into were not intended to raise the prices of kitted oncology assays, nor to diminish innovation in the area of kitted oncology assays. (Goswami (Illumina) Tr. 3217–18.) Providing an infrastructure on which developers can create tests allows them to develop more quickly and to lower costs for development. (Goswami (Illumina) Tr. 3217.) These IVD agreements spur innovation because many customers would not have been able to consider IVD tests without access to an infrastructure like Illumina's. (Goswami (Illumina) Tr. 3217–18; *see also* Leite (Illumina/InterVenn) Tr. at 2181–82.)

Response to Finding No. 1034.3

The proposed finding is vague because it fails to define or explain what the phrases "were not intended" and "infrastructure like Illumina's" mean.

[redacted]

1034.4 Illumina is holding GRAIL separate and would be happy to enter into an IVD agreement with GRAIL, but GRAIL has not indicated any intention to do so yet. [redacted] 3273.)

Response to Finding No. 1034.4

[redacted]

[redacted]

[redacted]

1034.5 [redacted]

Response to Finding No. 1034.5

[redacted]

1035. The Open Offer provision on IVD agreements and FDA documentation addresses the potential foreclosure concerns that have been raised because they prevent Illumina from withholding support as MCED test developers seek FDA approval. (RX6002 (Guerin-Calvert Trial Dep. at 74).)

Response to Finding No. 1035

The proposed finding should be disregarded because it is not a "finding of fact," but rather a legal conclusion in contravention of this Court's order and the Part 3 rules. (*See* 16 C.F.R. § 3.46; Order on Post-Trial Findings). The proposed finding relies solely upon the self-serving testimony of Respondents' paid expert, Ms. Guerin-Calvert, and does not cite to any customer subject to the Open Offer to support Respondents' proposed "fact."

The proposed finding is vague because it fails to define or describe what "potential foreclosure concerns" it is referring to. The proposed finding is also vague because it is unclear

how the Open Offer's IVD agreement "prevent[s] Illumina from withholding support as MCED test developers seek FDA approval.

The proposed finding is misleading to the extent it implies that the Open Offer resolves customer concerns regarding Illumina's assistance of customer going through FDA approval.

[redacted]

1035.1 By using standardized agreements, the provision ensures that customers know in advance what the terms of such an agreement will be. (RX6002 (Guerin-Calvert Trial Dep. at 74–75).)

Response to Finding No. 1035.1

The proposed finding is vague because it fails to define or describe what "standardized agreements," "the provision," and "agreement" the Respondents are referring to.

The proposed finding is misleading to the extent it implies that standardized agreements resolve customer concerns regarding the Open Offer. [redacted]

[redacted] Therefore, this Court should disregard the proposed finding.

1035.2 [redacted]

Response to Finding No. 1035.2

[redacted]

[redacted]

1035.3 The IVD agreement and FDA documentation provision specifically guarantees that Illumina will provide equal or greater assistance to MCED test developers with respect to FDA approval than it did premerger. (RX6002 (Guerin-Calvert Trial Dep. at 75).)

Response to Finding No. 1035.3

The proposed finding relies solely upon the self-serving testimony of Respondents' paid expert, Ms. Guerin-Calvert, and does not cite to any customer with actual experience in the industry or any customer subject to the Open Offer to support Respondents' proposed "fact."

The proposed finding is vague because it fails to point to which part of the FDA provision in the Open Offer "specifically guarantees that Illumina will provide equal or greater assistance to MCED test developers with respect to FDA approval than it did premerger." The Open Offer makes no such "guarantee." (PX0064 (Illumina) at 008 (Illumina Open Offer, Mar. 29, 2021)). Additionally, the proposed finding is vague because it fails to define or explain what "equal or greater assistance" means. It is unclear who gets to decide whether a customer has been provided "equal or greater assistance" and who this "equal or greater assistance" is based off of.

The term "guarantee" is misleading to the extent it implies that Illumina cannot breach

the terms of the Open Offer. As [redacted]

Moreover, the Acquisition changes Illumina's incentives to disadvantage their MCED customers. [redacted] Guardant's Senior Vice President of Commercial, William Getty, testified that after the acquisition, Illumina's "incentive to work with us goes down almost to nothing because ultimately we will now be competing in the same market, and therefore Illumina, as they should, will want to maintain a competitive advantage over Guardant in that space." (PX7105 (Getty (Guardant) Dep. at 68-69)).

Ultimately, as [redacted]

6. **Intellectual Property**

1036. Customers who sign the Open Offer receive a right under Illumina's core intellectual property to use the relevant products. (deSouza (Illumina) Tr. 2405; PX0064 (Illumina) at 9.)

Response to Finding No. 1036

The proposed finding is vague because it fails to define or describe what "relevant products" includes. Additionally, nowhere in the intellectual property provision of the Open Offer uses the term "relevant product." (PX0064 at 009 (Illumina Open Offer agreement, Mar. 29, 2021)). The proposed finding is vague because it fails to define or describe what "core intellectual property" means even though it is a define term in the Open Offer. (PX0064 at 033 (Illumina Open Offer agreement, Mar. 29, 2021)).

The proposed finding is misleading to the extent it implies that a right to Illumina's core intellectual property resolves customers concerns re intellectual property. Customers are concerned that Illumina may wield its application-specific IP, which is specifically carved out of the Open Offer terms, to disadvantage Grail's rivals. [redacted] Guardant's Mr. Getty has concerns about Illumina and Grails combined intellectual property portfolio post-acquisition. (PX7040 (Getty (Guardant) IHT at 192-93) (stating that "intellectual property is a very important component" and "it forms a moat for others to have – to have to penetrate in

order to, you know, be a formidable competitor. And so, you know, the intersection of the IP associated with a company who owns all the underlying technology and then, you know, potentially layering on additional patents on top of that, you know, it creates a rather challenging dynamic for other companies to potentially develop competing modalities that leverage that underlying technology because there's an intersection there")). Mr. Getty testified that he anticipates that the Illumina-Grail intellectual property portfolio will impact Guardant's decisions on innovating going forward. (PX7040 (Getty (Guardant) IHT at 193) (adding that "in large part everyone is dependent on Illumina," and that if Illumina were to "suggest that there is some, you know, infringement ongoing," that "[i]t just may stop you in your track to say, Wow, we can't afford to fight with them")). [redacted]

The proposed finding is misleading to the extent it implies that Illumina cannot breach the terms of the Open Offer. As [redacted]

Moreover, the Acquisition changes Illumina's incentives to disadvantage their MCED customers. [redacted]

[redacted]

[redacted] Guardant's Senior Vice President of Commercial, William Getty, testified that after the acquisition, Illumina's "incentive to work with us goes down almost to nothing because ultimately we will now be competing in the same market, and therefore Illumina, as they should, will want to maintain a competitive advantage over Guardant in that space." (PX7105 (Getty (Guardant) Dep. at 68-69)). Therefore, this Court should disregard the proposed finding.

> 1036.1 "'Intellectual Property Right(s)' means all rights in patent, copyrights (including rights in computer software), trade secrets, know-how, trademark, service mark and trade dress rights and other industrial or intellectual property rights under the laws of any jurisdiction, whether registered or not and including all applications therefor and registrations thereto." (PX0064 (Illumina) at 4.)

Response to Finding No. 1036.1

Complaint Counsel acknowledges that the Open Offer contains the quoted language. However, it is misleading to assume that Illumina will abide by the terms of its Open Offer. As

[redacted]

Moreover, the Acquisition changes Illumina's incentives to disadvantage their MCED customers. [redacted]

[redacted] Guardant's Senior Vice President of Commercial, William Getty, testified that after the acquisition, Illumina's "incentive to work with us goes down almost to nothing because ultimately we will now be competing in the same market, and therefore Illumina, as they should, will want to maintain a competitive advantage over Guardant in that space." (PX7105 (Getty (Guardant) Dep. at 68-69)).

The proposed finding is misleading to the extent it carves out protection for application specific intellectual property. Customers testified to the importance of application-specific IP and how Illumina can wield its application-specific IP to disadvantage Grail rivals. Illumina's Open Offer does not provide customers a right or license to any application-specific IP, and in fact carves application-specific IP out of the Open Offer's IP protections. (*See* PX0064 at 009 (Illumina Open Offer agreement, Mar. 29, 2021)). [redacted]

[redacted] is made even more real by the fact that Illumina's arbitration provision specifically carves out intellectual property disputes allowing Illumina to entangle customers in years long legal battles even if no IP infringement is ever proven. (PX0064 at 10 (Illumina Open Offer agreement, Mar. 29, 2021)). Therefore, this Court should disregard the proposed finding.

> 1036.2 "'Illumina Intellectual Property Rights' means all Intellectual Property Rights owned or controlled by Illumina or Affiliates of Illumina during the Term of this Agreement. Application Specific IP and Core IP are separate, non-overlapping, subsets within the Illumina Intellectual Property Rights." (PX0064 (Illumina) at 4.)

Response to Finding No. 1036.2

Complaint Counsel acknowledges that the Open Offer contains the quoted language. However, it is misleading to assume that Illumina will abide by the terms of its Open Offer. As [redacted]

[redacted]

Moreover, the Acquisition changes Illumina's incentives to disadvantage their MCED customers. [redacted] Guardant's Senior Vice President of Commercial, William Getty, testified that after the acquisition, Illumina's "incentive to work with us goes down almost to nothing because ultimately we will now be competing in the same market, and therefore Illumina, as they should, will want to maintain a competitive advantage over Guardant in that space." (PX7105 (Getty (Guardant) Dep. at 68-69)). Therefore, this Court should disregard the proposed finding.

> 1036.3 "'Core IP' means Illumina Intellectual Property Rights that pertain to or cover aspects or features of any Supplied Product (or use thereof), or software embedded in or installed on Illumina hardware (or use thereof), or software that Illumina hardware is designed to communicate or interact with (or use thereof), that are common to such Supplied Product in all applications and all fields of use." (PX0064 (Illumina) at 3.)

Response to Finding No. 1036.3

Complaint Counsel acknowledges that the Open Offer contains the quoted language. However, it is misleading to assume that Illumina will abide by the terms of its Open Offer. As [redacted]

Moreover, the Acquisition changes Illumina's incentives to disadvantage their MCED customers. [redacted] Guardant's Senior Vice President of Commercial, William Getty, testified that after the acquisition, Illumina's "incentive to work with us goes down almost to nothing because ultimately we will now be competing in the same market, and therefore Illumina, as they should, will want to maintain a competitive advantage over Guardant in that space." (PX7105 (Getty (Guardant) Dep. at 68-69)). Therefore, this Court should disregard the proposed finding.

> 1036.4 The Open Offer requires that "Customer's purchase of Supplied Products under this Supply Agreement confers upon Customer the non-exclusive, non-transferable, personal, non-sublicensable right solely under Illumina's Core IP to use the Supplied Products, only with Illumina hardware and software, and only in Customer facilities." (PX0064 (Illumina) at 9.)

Response to Finding No. 1036.4

Complaint Counsel acknowledges that the Open Offer contains the quoted language. However, the term "requires" is misleading to assume that Illumina will abide by the terms of its Open Offer. As [redacted]

Moreover, the Acquisition changes Illumina's incentives to disadvantage their MCED customers. [redacted]

[redacted]

[redacted] Guardant's Senior Vice President of Commercial, William Getty, testified that after the acquisition, Illumina's "incentive to work with us goes down almost to nothing because ultimately we will now be competing in the same market, and therefore Illumina, as they should, will want to maintain a competitive advantage over Guardant in that space." (PX7105 (Getty (Guardant) Dep. at 68-69)). Therefore, this Court should disregard the proposed finding.

> 1036.5 The Open Offer's provision on the right to use the Supplied Products under Illumina's Core IP addresses the potential foreclosure concerns that have been raised by ensuring that there will be no concern or confusion about whether these Core IP rights will be provided to customers in the future. (RX6002 (Guerin-Calvert Trial Dep. at 77–79).)

Response to Finding No. 1036.5

The proposed finding should be disregarded because it is not a "finding of fact," but rather a legal conclusion in contravention of this Court's order and the Part 3 rules. (*See* 16 C.F.R. § 3.46; Order on Post-Trial Findings). The proposed finding relies solely upon the self-serving testimony of Respondents' paid expert, Ms. Guerin-Calvert, and does not cite to any customer subject to the Open Offer to support Respondents' proposed "fact."

The proposed finding is vague because it fails to define or describe what "potential foreclosure concerns" it is referring to.

The proposed finding is misleading to the extent it implies the Open Offer resolves customer concerns regarding Illumina's ability and incentive to wield its intellectual property in order to disadvantage Grail's rivals. Freenome requested such a license because it was concerned that Illumina may wield its application-specific IP, which is specifically carved out of the Open Offer terms, to disadvantage them and Grail's rivals. [redacted]

[redacted]

[redacted]

[redacted]

[redacted]

Customer concerns regarding Illumina's incentive and ability to disadvantage Grail's rivals through the use of intellectual property litigation has become even more real with Illumina suing Guardant. Shortly after the Part 3 hearing in the Illumina-Grail matter, where Guardant put forward two witnesses to testify at trial on behalf of the Government, Illumina sued Guardant in federal court, alleging intellectual property violations against Guardant's founders from when they were Illumina employees over nine years ago and that Illumina allegedly learned about three years ago. (*See* Complaint, Illumina, Inc. v. Guardant Health, Inc., et. al., No. 1:22-cv-00334 (D. Del. Mar. 17, 2022)). Therefore, this Court should disregard the proposed finding.

1037. Under the Open Offer, Illumina commits that it will not have the right to cease shipments of the products solely on the basis of a claim of infringement of Illumina's intellectual property rights. (Berry (Illumina) Tr. 864; deSouza (Illumina) Tr. 2405; PX0064 (Illumina) at 9.)

Response to Finding No. 1037

The proposed finding is misleading and unclear because the use of "solely on the basis of a claim of infringement of Illumina's intellectual property" under this term of the Open Offer

means Illumina could cease shipments of products if a claim of IP infringement is coupled with another claim. It is unclear to what this other claim needs to be or to what extent it must be proven.

The proposed finding is misleading to the extent it implies Illumina cannot breach the terms of the Open Offer. As [redacted]

1037.1 The Open Offer requires that "[i]n no event will Illumina have the right to cease shipping of the Supplied Product solely on the basis of any alleged claim of infringement of any intellectual property rights of Illumina." (PX0064 (Illumina) at 9.)

Response to Finding No. 1037.1

The proposed finding is misleading and unclear because the use of "solely on the basis of a claim of infringement of Illumina's intellectual property" under this term of the Open Offer

means Illumina could cease shipments of products if a claim of IP infringement is coupled with another claim. It is unclear to what this other claim needs to be or to what extent it must be proven.

Complaint Counsel acknowledges that Respondents' Open Offer letter includes the quoted language. However, the term "requires" is misleading to the extent it implies that Illumina cannot breach the terms of the Open Offer. [redacted]

1037.2 This provision applies even if Illumina has a legitimate claim of infringement. (RX6002 (Guerin-Calvert Trial Dep. at 78).) [redacted]

Response to Finding No. 1037.2

[redacted]

[redacted]

1037.3 This provision effectively addresses the foreclosure concern that Illumina could disrupt supply to GRAIL rivals. (*See* RX6002 (Guerin-Calvert Trial Dep. at 77–79).)

Response to Finding No. 1037.3

The proposed finding should be disregarded because it is not a "finding of fact," but rather a legal conclusion in contravention of this Court's order and the Part 3 rules. (*See* 16 C.F.R. § 3.46; Order on Post-Trial Findings). The Court should disregard this evidence.

The proposed finding is vague and misleading. The proposed finding is vague because the term "effectively addresses," "foreclosure concern," and "disrupt supply" are unclear and undefined. In addition, the finding purports to speak to all foreclosure concerns but relies solely on the self-serving testimony of Respondents' paid expert, with no corroboration from Illumina's customers.

The proposed finding is misleading to the extent it implies that the Open Offer resolves customer concerns regarding supply disruption. [redacted]

[redacted]

7. Firewalls and Protection of Confidential Information

1038. The Open Offer requires Illumina not to share any customer confidential information with GRAIL or its subsidiaries or employees, or with Illumina employees who work with GRAIL. (Rabinowitz (Natera) Tr. 425; Berry (Illumina) Tr. 916–17; PX0064 (Illumina) at 9.)

Response to Finding No. 1038

The proposed finding is misleading because it incorrectly cites to Dr. Rabinowitz's testimony. Dr. Rabinowitz did not testify that the Open Offer "requires Illumina not to share any customer confidential information with GRAIL or its subsidiaries or employees, or with Illumina employees who work with GRAIL." [redacted] Respondents pick and choose the snippets of Dr. Rabinowitz testimony that best fit their narrative and in the process misconstrue what Dr. Rabinowitz testified to.

The proposed finding is vague because it fails to define or describe what constitutes "confidential information." Additionally, nowhere in the Open Offer is the term "confidential information" define. (PX0064 (Illumina Open Offer agreement, Mar. 29, 2021)). Even Illumina executive and Open Offer signatory testified that the Open Offer does not define what constitutes "confidential information." (Berry (Illumina) Tr. 716-18).

[redacted]

[redacted]

[redacted]

1038.1 The Open Offer requires that "[t]o the extent that Illumina may have access to confidential information ('Confidential Information') of Customer in connection with this Supply Agreement or the provision of Supplied Products by Illumina to Customer, Illumina shall in no event share such Confidential Information of Customer with GRAIL or any subsidiary of GRAIL, or any employees who work within GRAIL." (PX0064 (Illumina) at 9.)

Response to Finding No. 1038.1

The proposed finding is vague because it fails to define or describe what constitutes "confidential information." Additionally, nowhere in the Open Offer is the term "confidential information" define. (PX0064 (Illumina Open Offer agreement, Mar. 29, 2021)). Even Illumina executive and Open Offer signatory testified that the Open Offer does not define what constitutes "confidential information." (Berry (Illumina) Tr. 716-18).

Complaint Counsel acknowledges that Respondents' Open Offer letter includes the quoted language. However, the term "requires" is misleading to the extent it implies that Illumina cannot breach the terms of the Open Offer. **As** [redacted]

The proposed finding is also misleading to the extent it implies that Illumina can effectively prevent leaks between Illumina and GRAIL. [redacted]

[redacted]

The proposed finding is misleading to the extent it implies customers do not have concerns regarding the Open Offer's confidentiality provision. [redacted]

[redacted]

Ultimately, as Guardant's Mr. Getty testified with respect to Guardant's concerns about its confidential information being shared between Illumina and Grail, "Illumina has an incentive to share that information with GRAIL." (PX7105 (Getty (Guardant) Dep. at 100)). [redacted]

1039. Under the Open Offer, Illumina must establish a firewall to protect customers' confidential information by prohibiting the flow of information between Illumina and GRAIL. (Rabinowitz (Natera) Tr. 425; deSouza (Illumina) Tr. 2404–05; PX0064 (Illumina) at 9–10; PX7085 (Harada (Exact/Thrive) Dep. at 113–14).)

Response to Finding No. 1039

The proposed finding is misleading because it incorrectly cites to Dr. Rabinowitz's testimony. Dr. Rabinowitz did not testify that under the Open Offer "Illumina must establish a firewall to protect customers' confidential information by prohibiting the flow of information between Illumina and GRAIL." [redacted] Respondents pick and choose the snippets of Dr. Rabinowitz testimony that best fit their narrative and in the process misconstrue what Dr. Rabinowitz testified to.

[redacted]

[redacted]

The proposed finding is vague because it fails to define or describe what constitutes "confidential information." Additionally, nowhere in the Open Offer is the term "confidential information" define. (PX0064 (Illumina Open Offer agreement, Mar. 29, 2021)). Even Illumina executive and Open Offer signatory testified that the Open Offer does not define what constitutes "confidential information." (Berry (Illumina) Tr. 716-18).

[redacted]

[redacted]

[redacted]

1039.1 The Open Offer requires that "Illumina shall establish a firewall designed to prevent any GRAIL personnel (and any Illumina personnel carrying out activities with respect to the GRAIL business or products) from accessing any Confidential Information obtained by or made available to Illumina relating to Customer or its business or products, whether pursuant to this Supply Agreement or otherwise." (PX0064 (Illumina) at 9–10.)

Response to Finding No. 1039.1

[redacted]

[redacted]

[redacted]

[redacted]

1039.2 The firewall provision was added to assure customers that Illumina will not allow GRAIL personnel or Illumina personnel who have interactions with GRAIL to access customer confidential information. (Goswami (Illumina) Tr. 3231.)

Response to Finding No. 1039.2

This proposed finding is misleading because it purports to speak to customer assurances but relies solely on the self-serving testimony of an Illumina executive without any corroboration from Illumina's customers. The proposed finding is also misleading to the extent it implies that Illumina can effectively prevent leaks between Illumina and GRAIL. [redacted]

[redacted]

1039.3 The firewall would still be able to protect information if employees moved from Illumina to GRAIL or from GRAIL to Illumina because Illumina clearly outlines what counts as confidential information and what the employees' obligations are under their confidentiality agreements. (Goswami (Illumina) Tr. 3232.)

Response to Finding No. 1039.3

The proposed finding is vague and misleading because it fails to explain how "Illumina clearly outlines what counts as confidential information." The proposed finding is vague because it fails to define or describe what constitutes "confidential information." Additionally, nowhere in the Open Offer is the term "confidential information" define. (PX0064 (Illumina Open Offer agreement, Mar. 29, 2021)). Even Illumina executive and Open Offer signatory testified that the Open Offer does not define what constitutes "confidential information." (Berry (Illumina) Tr. 716-18).

The proposed finding is vague because it fails to explain or describe what these "employee[] obligations" are. The proposed finding is unsupported because Respondents fail to cite to any of the "confidentiality agreements" where Illumina has "clearly outline[d] what counts as confidential information and what the employees' obligations are…"

This proposed finding is misleading because it relies solely on the self-serving testimony of an Illumina executive. The proposed finding is also misleading to the extent it implies that Illumina can effectively prevent leaks between Illumina and GRAIL. [redacted]

[redacted]

1039.4 If someone at Illumina shares confidential information of a test developer with someone at GRAIL, there are codified disciplinary procedures in place, up to termination of the employee. (Goswami (Illumina) Tr. 3232–33.)

Response to Finding No. 1039.4

This proposed finding is vague and misleading. The proposed finding is vague because "codified disciplinary procedures" is undefined.

This proposed finding is misleading because it relies solely on the self-serving testimony of an Illumina executive. The proposed finding is also misleading to the extent it implies that Illumina can effectively prevent leaks between Illumina and GRAIL. [redacted]
